Depreciation Calculations

I have developed an Excel model to calculate depreciation rates using a depreciation system consisting of the Straight Line Method, the Average Life Group Procedure, and the Remaining Life Technique. This is the same depreciation system utilized by Gannett Fleming to calculate the depreciation rates presented in Table 1 of Section VI of Pepco's 2021 Depreciation Study. The detailed depreciation calculations in Section IX of Pepco's 2021 Depreciation Study are also a result of using this traditional method.

The depreciation calculations I present below were calculated using the traditional method and do not represent the depreciation rates that result using the DC Present Value net salvage discount method.

Comparison of BCA and Pepco Recommendations

There are three main areas of difference between this depreciation study and Pepco's 2021 depreciation study: (1) the average service lives and curve types for the certain plant accounts; (2) the net salvage rate for Account 362; and (3) the present value discount rates applied to each account.

My recommendations are based on using the Handy Whitman values to discount the net salvage, with each account having a distinct discount factor. Pepco's recommendations are based on using a uniform discount rate of 2.5% for each account. Additionally, as already discussed, I have proposed changes to the average service lives and/or curve types for 9 accounts, relative to Pepco's proposed Iowa curves. I also recommend an adjustment to the net salvage rate used for Account 362.

The adjustments proposed in this study result in a $22.59 million reduction to Pepco's 2021 study year depreciation expense. Of this $22.59 million, $22.53 million is attributed to the Distribution plant and the remaining $0.058 million is associated with the General plant. The differences between Pepco's proposal and my proposal are summarized in Table 2.

Benchmark

This section contains the results of a benchmarking exercise that was performed to ensure that the resulting depreciation rates for each account calculated with the depreciation model used for this study match the depreciation rates calculated by the Gannett Fleming software used by Mr. Ned Allis on behalf of Pepco. As is shown below in Table 3, the two models only differ by only $7,834 out of a total $135.26 million of depreciation expense, or approximately 0.006%. This benchmarking exercise proves that my depreciation model is an accurate and acceptable tool for calculating depreciation expense and depreciation rates.

I. <u>INTRODUCTION</u>

Q. PLEASE STATE YOUR FULL NAME, ADDRESS, AND OCCUPATION.

A. My name is Kevin J. Mara. My business address is 1850 Parkway Place, Suite 800, Marietta, Georgia 30067. I am the Executive Vice President of the firm of GDS Associates, Inc. ("GDS") and Principal Engineer for a GDS company doing business as Hi-Line Engineering.

Q. PLEASE DESCRIBE GDS ASSOCIATES, INC.

A. GDS is an engineering and consulting firm with offices in Marietta, Georgia; Austin, Texas; Auburn, Alabama; Bedford, New Hampshire; Augusta, Maine; Orlando, Florida; Folsom, California, Redmond, Washington; and Madison, Wisconsin. GDS has over 180 employees with backgrounds in engineering, accounting, management, economics, finance, and statistics. GDS provides rate and regulatory consulting services in the electric, natural gas, water, and telephone utility industries. GDS also provides a variety of other services in the electric utility industry including power supply planning, generation support services, financial analysis, load forecasting, and statistical services. Our clients are primarily publicly-owned utilities, municipalities, customers of privately-owned utilities, groups or associations of customers, and government agencies.

Q. PLEASE SUMMARIZE YOUR EDUCATIONAL EXPERIENCE.

A. I received a degree of Bachelor of Science in Electrical Engineering from Georgia Institute of Technology in 1982.

Q. PLEASE SUMMARIZE YOUR PROFESSIONAL EXPERIENCE.

A. Between 1983 and 1988, I worked at Savannah Electric and Power as a distribution engineer designing new services for residential, commercial, and industrial customers. From 1989-1998, I was employed by Southern Engineering Company as a planning engineer providing planning, design, and consulting services to publicly-owned electric utilities. In 1998, I, along with a partner, formed a new firm, Hi-Line Associates, which specialized in the design and planning of electric distribution systems. In 2000, Hi-Line Associates became a wholly owned subsidiary of GDS Associates, Inc. and the name of the firm was changed to Hi-Line Engineering, LLC. In 2001, we merged our operations with GDS Associates, Inc., and Hi-Line Engineering became a department within GDS. I serve as the Principal Engineer for Hi-Line Engineering and am Executive Vice President of GDS Associates. I have field experience in the operation, maintenance, and design of transmission and distribution systems. I have performed numerous planning studies for electric cooperatives and municipal systems. I have prepared short circuit models and overcurrent protection schemes for numerous electric utilities. My experience includes assisting utilities with improving system reliability. I have also provided general consulting services, underground distribution design, and territorial assistance. I am a registered engineer in Virginia as well as in 22 other states.

Q. HAVE YOU PREPARED AN ATTACHMENT SUMMARIZING YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL EXPERIENCE?

A. Yes. Exhibit OPC (E)-1 provides these details.

Q. FOR WHOM ARE YOU APPEARING?

A. I am testifying on behalf of the Office of the People's Counsel for the District of Columbia ("OPC" or "Office").

Q. HAVE YOU TESTIFIED BEFORE IN THE DISTRICT OF COLUMBIA?

A. Yes. I have filed testimony in *Formal Case Nos.* 1076, 1087, 1103, 1119, 1139, and 1156. I have also filed affidavits in *Formal Case Nos.* 1116, 1144, and 1145.

Q. WAS YOUR TESTIMONY PREPARED BY YOU OR UNDER YOUR DIRECT SUPERVISION AND CONTROL?

A. Yes.

II. SCOPE AND SUMMARY OF TESTIMONY

Q. WHAT IS THE SCOPE AND PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

A. I have been asked by OPC to review both the Multi-Year Rate Plan ("MYP") proposal and the traditional rate case filing submitted by Potomac Electric Power Company ("Pepco" or the "Company") in this proceeding. The primary focus of my testimony is the construction and capital investment plans submitted by the Company. I also provide testimony concerning Pepco's new load forecasting methodology and the impacts of those forecasts on the reasonableness of the Company's proposed capital spending. I also discuss Pepco's proposed use of battery energy storage systems ("BESS") to delay capacity upgrades.

Q. PLEASE SUMMARIZE YOUR CONCERNS WITH RESPECT TO THE CAPITAL SPENDING THAT PEPCO HAS INCLUDED IN ITS MULTIYEAR RATE PLAN.

A. The Office opposes the Company's proposed MYP for the reasons detailed in Dr. Dismukes' testimony. Nevertheless, I reviewed the construction and capital investment costs included for recovery under the proposed MYP in the event that the Commission accepts the MYP as proposed or some variant of the Company's proposal to base costs on forecasted construction budgets. Based on my review, I am concerned that many of the projects included in the Company's budget are not consistent with the purported goals of the MYP and, in several cases, could be deferred or eliminated in their entirety.

Q. PLEASE SUMMARIZE YOUR CONCERNS WITH THE COMPANY'S CLIMATE READY GRID INVESTMENTS.

A. Pepco claims that its MYP investments are designed to foster what Pepco calls a "Climate Ready Grid," however, over 90% of the capital improvements are business as usual for Pepco – *i.e.* replacement of poles, cables, transformers, and substations with similar poles, cables, transformers, and substations. These replacements are not "modernizing" the grid or making it ready for the District's climate initiatives but are simply projects that any prudent utility would undertake to maintain system reliability. There are a few advanced projects already included in the Company's capital budgets, such as the Advanced Distribution Management System ("ADMS"), that can help with monitoring and potentially controlling behind the meter resources.

Q. PLEASE SUMMARIZE YOUR CONCERNS WITH THE COMPANY'S CONSTRUCTION AND CAPITAL INVESTMENT PLANS.

A. Load forecasting is one of the most critical steps in developing a capital plan. Pepco has made a significant change in its load forecasting methodology. This change, coupled with a slowdown in construction and energy use in the District, has resulted in a reduction of 528 MVA for projected load for 2025 when compared to the Company's forecast made as recently as 2021. This reduction should have impacts on the Company's planned capital projects, however, these revised load forecasts are not reflected in the MYP budget and therefore I recommend a number of projects be canceled or delayed due to these significant reductions. These delays include the addition of a 5th transformer at the Waterfront Substation, and a 4th transformer at Alabama Substation as well battery energy storage systems that are no longer required to delay capacity expansion at the Alabama Substation and Mt. Vernon Substation.

Q. PLEASE SUMMARIZE YOUR CONCERN WITH THE ALLOCATION OF SUBTRANSMISSION COSTS TO THE DISTRICT.

A. At the direction of the Commission, Pepco allocates the cost of subtransmission between the District and Maryland using the Average and Excess Non-Coincident Peak Demand ("AED-NCP") allocation method. Pepco's data responses in this proceeding demonstrate that at least two projects in Maryland were inadvertently flagged by Pepco as subtransmission when in fact these projects should not have allocated to the District. I document those projects in my testimony along with the adjustments to be made to the allocated capital costs.

Q. PLEASE SUMMARIZE YOUR CONCERN WITH THE DOWNTOWN RESUPPLY PROJECT.

A. In 2018, the Downtown Resupply Project was originally proposed as a means to use the new 230kV Champlain Substation as a source to re-feed the Georgetown, and F Street Substations with 69kV cables and L Street Substation with 35kV cables. The result will be the retirement of older 69kV pipe-type 69kV cables from the Potomac River Substation to Georgetown Substation and from Georgetown Substation to the F Street Substation. Pepco has now significantly changed this project in the MYP proposal, and the budget has grown from $667 million to a nearly $1.4 billion dollar project. As I explain in my testimony, this change is not justified and therefore all projects related to these subtransmission modifications should be eliminated from the MYP budget.

Q: **PLEASE SUMMARIZE YOUR CONCERNS WITH THE COMPANY'S TRADITIONAL TEST YEAR FILING.**

A. In addition to my concerns about the MYP projects that are also included in Pepco's traditional test year budget, the filing also includes several projects that may not be completed and provide benefits to ratepayers during the rate-effective period. These projects include Project 70096: 13kV Distribution Cutovers "F" St to "L" St and Project 80906: Pepco DDOT Bridge 78 Relocation - 69kV pipe type.

III. <u>CONCERNS REGARDING PEPCO'S MYP CONSTRUCTION AND CAPITAL INVESTMENT PLANS</u>

Q. WHAT IS YOUR UNDERSTANDING OF PEPCO'S CLIMATE READY GRID INVESTMENTS?

A. My understanding is that Pepco claims their proposed Climate Ready Grid expenditures constitute a series of investments into the reliability and resiliency of Pepco's distribution system that are needed to prepare the distribution system for the coming energy transformation and to meet the District's climate goals.[1] However, Pepco has not been able to identify which capital projects advance Pepco's objectives for a Climate Ready Grid[2] or explain how the Company proposes to measure the success of its proposed investments.[3]

Q. BASED ON YOUR REVIEW OF THE COMPANY'S CONSTRUCTION BUDGET ARE THE PROJECTS INCLUDED IN THE MYP FUNDAMENTALLY DIFFERENT FROM THE COMPANY'S PRIOR CAPITAL EXPENDITURES?

A. No. In my opinion, the vast majority of the MYP projects are similar to the projects I have seen in at least the last four Pepco rate cases. These types of projects include replacement of aging infrastructure, reliability improvement projects, voltage conversion projects, capacity upgrades to meet projected load forecasts, and upgrades to maintain N-1 contingencies and maintain voltage levels to customers. These types of projects have consistently been included in Pepco construction budgets since at least *Formal Case No. 1103* in 2013.

Q. WILL THE PROJECTS INCLUDED IN THE MYP MODERNIZE THE GRID?

---

1 Exhibit Pepco (H) (Cantler) at 6:14-16.

2 Exhibit OPC (E)-2 at page 1-2 (*Formal Case No. 1176*, Pepco Response to OPC Data Request 4-1(b)).

3 Exhibit OPC (E)-2 at page 1 (Pepco Response to OPC Data Request 4-1(a)).

A. Again, in my opinion, no. Modernizing the grid is often thought of improving with new technology. But in this case, Pepco is not modernizing the grid; the Company is simply replacing components like for like such as power transformer replacements at substations. For example, Paper-Insulated Lead Covered ("PILC") Cable Replacement Program does not modernize the grid as stated by Witness Cantler.[4] Rather this program that has been in place in one form or another since 2013,[5] replaces old PILC cable with new ethylene propylene rubber (EPR) cable. Another example is the 4kV conversion projects which also have been an on-going initiative since at least 2013.[6] These 4kV conversion projects replace equipment that has reached the end of its useful life and that, without replacement, would result in a decreased reliability performance for that equipment.[7] Simply replacing old equipment with new equipment, however, is not modernizing the grid in any meaningful way.

The core function of an electric utility is providing reliable service. These projects in the MYP budget will replace aging infrastructure, increase capacity to meet projected loads, and increase reliability with capital improvements; however, I do not see how these projects can be classified as Climate Ready Grid investments when in actuality it is

4 Exhibit Pepco (H) (Cantler) at 37:15-21.

5 *See Formal Case No. 766-ACR-12, In the Matter of the Commission's Fuel Adjustment Clause Audit and Review Program – Annual Consolidated Report*, Order No. 16975 at ¶ 76, rel. November 29, 2012 ("Order No. 16975").

6 *See* Order No. 16975 at ¶ 21.

business as usual for an electric utility. These core utility function costs have been recovered through traditional cost of service rate cases for many years in the District.

Q. TO YOUR KNOWLEDGE HAS PEPCO CHANGED THEIR DESIGN CRITERIA FOR RESILIENCY FOR THE DISTRIBUTION GRID WITHIN THE DISTRICT?

A. No, Pepco has not established any new criteria for planning for resiliency.[8]

Q. IN YOUR ESTIMATION HOW MUCH OF THE BUDGETED COST FOR CAPITAL PROJECTS WITHIN THE MYP ARE CORE UTILITY FUNCTIONS?

A. Based on my review of the proposed capital projects, I estimate that over 95% of the budgeted amount for the executive categories listed in the following table are core utility functions. These functions include replacement of aging infrastructure, reliability improvement projects, voltage conversion projects, capacity upgrades to meet projected load forecasts, upgrades to maintain N-1 contingencies, and maintain voltage levels to customers. I have broken out my analysis by Executive Category in the following table.

	% of Budget that are Core Utility Functions		
Executive Category	**2023**	**2024**	**2025**
Capacity Expansion - Distribution	93%	93%	84%
Corrective Maintenance - Distribution	100%	100%	100%
Corrective Maintenance - Substation	100%	100%	100%
Facilities Relocation - PEPCO	100%	100%	100%
System Performance - Distribution	95%	96%	96%
System Performance - Substation	100%	98%	99%

8 Exhibit OPC (E)-4 at page 1 (Pepco Response to OPC Data Request 4-6(a)).

Q. DO ANY OF THE PROPOSED CAPITAL EXPENDITURES IN THE MYP HELP MODERNIZE THE PEPCO DISTRIBUTION SYSTEM?

A. Yes, the Pepco construction program includes certain projects related to the modernization of the Pepco distribution system which collectively create what Pepco refers to as the ADMS. Those projects and their budgeted costs include:

Project[9]	2023B	2024B	2025B	2026B
61976: ADMS Implementation	$4,554,810	$3,844,510	$3,460,070	$1,640,020
62068: GIS Core	$2,515,180	$1,523,980	$ 158,550	$ 156,860
78116:EU Outage Reporting and Analytics ADMS Integrations	$ 7,240	$1,048,320	$ 837,340	$ 147,820
78124:EU Outage Reporting and Analytics Implementation	$1,625,670	$ 256,710	$ 0	$ 0
84541:EU ADMS Convergence-Stage 2	$ 0	$ 0	$ 0	$3,485,350
78306:EU-Enterprise Asset Management 2.0	$ 541,080	$5,969,240	$7,252,480	$7,207,720
74122: Fiber Optic Builds	$ 927,100	$ 973,500	$2,026,810	$2,020,950

These projects will provide greater control of the grid; however, as I have previously discussed, these projects are a small percentage of the overall MYP construction budget.

Q. CAN YOU EXPLAIN THE PURPOSE OF THESE ADMS PROJECTS?

[9] Exhibit Pepco (H)-2 at pages 174, 175, 179, 184, 185, and 190.

A. Yes. According to Pepco, the ADMS projects will replace Pepco's outage management system and other specific distribution control systems, placing them on a common platform. The functionality will eventually enable the distribution operators to monitor, manage, and control the electrical grid by means of remote switching and reconfiguration of the system due to system conditions.[10] For example, the Enterprise Asset Management, for which Pepco has budgeted significant spending in years 2024-2026, is intended to allow for the management of new types of assets and ownership models needed for Distributed Energy Resources.[11] The proposed fiber optic projects provide additional communication needed to support grid automation, security, and monitoring.[12] These projects are intended to allow for greater communication with distributed generation and potentially more load management of customer devices.

Q. IN YOUR OPINION WILL THE ADMS SYSTEMS BENEFIT RATE PAYERS?

A. The ADMS system is replacing older information technology platforms used for GIS, outage management, remote monitoring, remote switching, etc, So, these new systems are necessary to upgrade older technology. These new systems should have more functionality and improve grid operations and come with an increased cost compared to simple replacement of existing platforms.

---

[10] Exhibit OPC (E)-27, Pepco Response to Data Request 6-24

[11] Exhibit Pepco (H)-2 at page 185.

[12] Exhibit Pepco (H)-2 at page 179.

Q. ARE THERE INVESTMENTS IN THE MYP BUDGET THAT GO BEYOND THE ADMS INFORMATION TECHNOLOGY UPGRADES PREVIOUSLY DISCUSSED?

A. Yes. Pepco has also included expenses related to sophisticated control schemes such as ADMS Convergence – Stage 2.0. This platform along with others create the foundation for the future Distributed Energy Resource Management System ("DERMS") that go beyond the necessary information technology upgrades.

Q. CAN YOU EXPLAIN HOW THE ADMS SYSTEM IS DIFFERENT FROM THE DISTRIBUTED ENERGY RESOURCE MANAGEMENT SYSTEM?

A. ADMS system is an Exelon Utilities platform to be deployed by Pepco. It replaces GIS, outage management and remote monitoring, remote switching, etc. The ADMS system provide consolidated control over the grid through remote operation. DERMS allows for common control of distributed energy resources to allow for more Distributed Energy Resources ("DER") to be connected to the grid and work collectively for the coordinated use of DER generated energy and utility generated energy. The DERMS is a future phase of the ADMS implementation with deployment not projected until 2029. The details and functionality and capabilities of the DERMS have yet to be fully scoped or defined.[13]

Q. IN YOUR OPINION, IS IT CLEAR THAT THE ADMS STAGE 2.0 AND THE FUTURE DERMS SYSTEMS BENEFIT RATE PAYERS?

---

[13] Exhibit OPC (E)-29, Pepco Response of OPC Data Request 6-20.

A. I cannot answer that question from an engineering perspective because Pepco has stated in response to OPC Data Request 6-21 that the final functionality of the ADMS Stage 2.0 and the DERMS systems is not clear at this time.[14] Moreover, the decision of whether to invest in DERMS technology is really a question for policy makers who must assess whether such investments are a reasonable means of achieving the District's climate goals. I believe that is a difficult assessment to make at this time because while the systems will purportedly allow more DERs to be deployed within the District, there is no way to know at this time whether the increase in DER deployment would amount to 10 new rooftop solar installations or 100 MW of new distributed generation. Therefore, it is not clear what benefits these proposed expenditures will provide from an engineering perspective or a climate perspective. I believe it is ultimately a policy question whether ratepayers should fund the sophisticated control schemes that Pepco has envisioned for ADMS 2.0 and the DERMS.

Q. CAN YOU PROVIDE A BREAKDOWN OF THE ADMS 2.0 AND DERMS SPENDING INCLUDED IN THE MYP?

A. Yes; based on my review, Project 84541:EU ADMS Convergence-Stage 2 with a budget of $3,485,350 in 2026 is the project not yet defined. From my review Pepco has not included any specific costs for the DERMS in Pepco's budgets through 2026 but Pepco has suggested that the DERMS program would be operational by 2029.

[14] Exhibit OPC (E)-30, Pepco Response of OPC Data Request 6-21.

Q. DO YOU HAVE ANY OBSERVATIONS REGARDING PEPCO'S LOAD FORECASTING METHODOLOGY?

A. Yes. Pepco has changed their method for load forecasting when compared to the prior rate case in *Formal Case No. 1156*. Load Forecasting is, in my opinion, a cornerstone of short- and long-range planning for transmission and distribution systems. Changes in electrical demand need to be met with the necessary capacity to reliably serve the future load. A reasonable load forecast is critical to ensure that a utility is making prudent expenditures that will be used and useful to meet anticipated future demand.

Q. CAN YOU PLEASE EXPLAIN PEPCO'S LOAD FORECASTING METHOD UTILIZED IN THE PRIOR RATE CASE?

A. In *Formal Case No. 1156*, which was filed in 2019, Pepco used an unadjusted 90/10 forecast utilizing the peak demand from the prior ten years as a baseline for load growth projections. The basic concept is that when the load occurs in the future, it will be less than the projection 90% of the time and 10% of the time the load will exceed the projection. This historical peak in the last 10 years was adjusted for known load increases (potential new business) and adjusted for load transfer, load management, and impacts of DER. This methodology based on the unadjusted historical 10-year peak resulted, in my opinion, in very aggressive, *i.e.*, high load projections as evidenced by a persistent overstatement between Pepco's projected 90/10 load and actual load on the distribution system.

Q. CAN YOU PLEASE EXPLAIN PEPCO'S CURRENT LOAD FORECASTING METHOD?

A. Yes. Starting in 2021, Pepco began using a new load forecasting tool known as the Distribution System Planning Load Forecasting ("DSP-LF") program.[15] This program compares the historical weather patterns for the previous year against a thirty-year record of weather patterns. The historical loads are then adjusted to match values expected during temperature extremes projected to occur once in a ten-year period. As with the prior methodology, these historical loads are adjusted further for new business, load transfer, and impacts of load management and DERs.[16] In addition, the growth trends including the anticipated electric vehicle charging loads which are known can be included in the potential new business and fossil fuel heating system conversions.[17]

Q. HAVE YOU COMPARED THESE TWO LOAD FORECASTING METHODS AND IF SO, WHAT IS YOUR CONCLUSION?

A. Yes, I have compared the two different load forecasts. The figure below shows the forecasted substation peak load of the District of Columbia as a whole over the next-10 years with current 2023 projections and the 2021 and 2022 projections.

---

15 Exhibit Pepco (H)-1 at page 20 of 82.

16 Exhibit Pepco (H)-1 at pages 20-21 of 82.

17 Exhibit OPC (E)-5 at page 1 (*Formal Case No. 1176*, Pepco Response to OPC Data Request 4-7(c)).

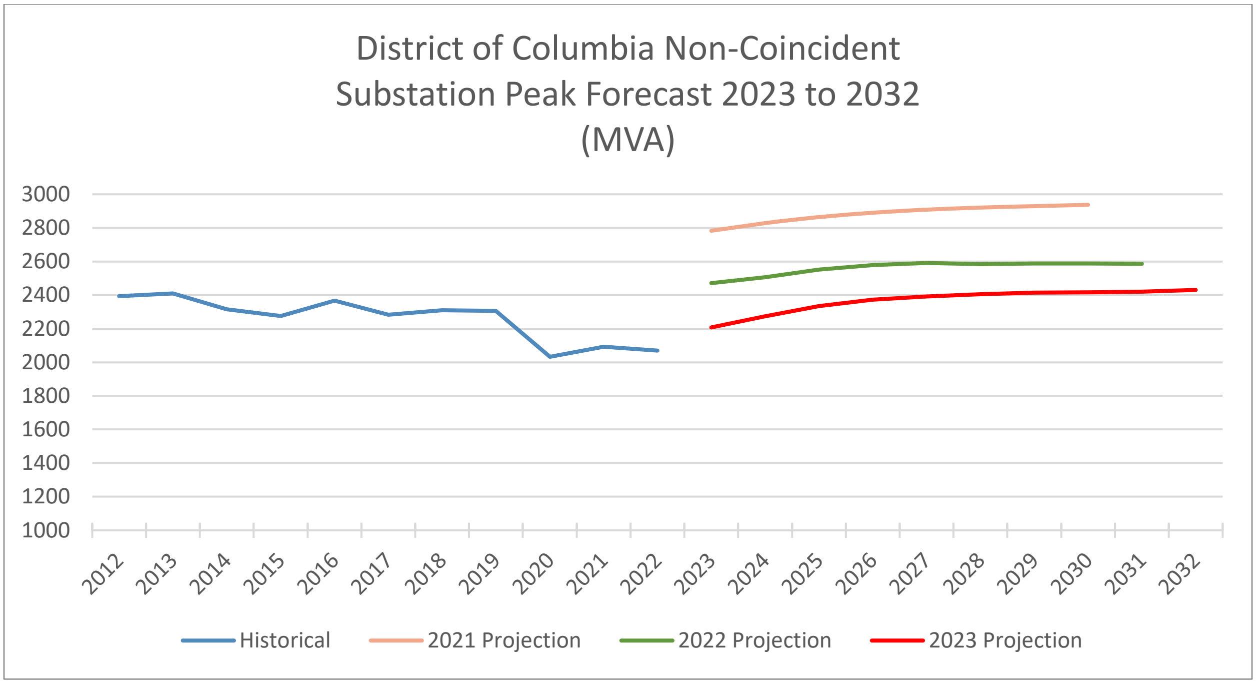

Exhibit OPC (E)-6, is attached to my testimony and shows a non-coincident peak demand forecast by Ward.

I have observed that the forecasts by Pepco in recent years are significantly lower than when the Company used the unadjusted 90/10 forecast method (*i.e*. the process used in the Company's last base rate case in *Formal Case No. 1156*). I have been critical of the overstated load forecasts produced by the prior method and believe the current method is yielding more accurate results that should produce more reasonable capital spending. The reduction in the forecast for the year 2025 from the 2021 forecast to the current 2023 forecast is 528 MVA. To put this in perspective, the new Mt. Vernon Substation will initially be built for 140 MVA with ultimate capacity of 210 MVA at a cost of $138 million. Some of this reduction in demand can be attributed to effects of energy conservation, load control programs and increase in solar interconnections. However, it is my opinion that the current forecast methods yield projections more reasonable than the prior method.

Q. WHAT SHOULD BE THE RESULT TO THE MULTI-YEAR PLAN WITH THE LOWER FORECASTED LOADS?

A. I would expect to see fewer projects justified based on increased capacity since the projected electrical demand at substations and feeders will be lower. As discussed below, however, there are several projects included in the MYP budget that can no longer be justified based on projected demand.

Q. **DOES THE MYP BUDGET SUBMITTED IN THIS PROCEEDING REFLECT THE MORE REASONABLE LOAD FORECAST PRODUCED BY THE COMPANY'S NEW FORECASTING APPROACH?**

A. No. The proposed MYP budget is based on the higher load forecasts produced by Pepco's prior load forecasting methodology.

Q. CAN YOU PROVIDE EXAMPLES OF PROPOSED CAPITAL EXPENSES THAT ARE NO LONGER REQUIRED DUE TO THE UPDATE IN THE LOAD FORECAST?

A. Yes. In my opinion, there are proposed capital projects at the Alabama Substation No. 136 and the Waterfront Substation No. 223 that cannot be justified based on Pepco's current load forecast.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE WATERFRONT SUBSTATION NO. 223?

A. I recommend that ITN 74085 and its associated cost of $635,610 be removed from the MYP budget if the Commission approves the MYP. The Waterfront Substation No. 223 is located near Audi Field which is the home of D.C. United. Pepco has a project budgeted (ITN 74085) to install a 5th transformer at this substation in 2024.[18] The justification for the project states that the existing load on this station is 180.3 MVA and by the year 2027, the load will increase by 21.0 MVA for a total load of 193.4 MVA and will nearly exceed the 216 MVA firm capacity of the substation.[19] However, the actual peak load in 2022 was only 129.6 MVA.[20] Therefore Pepco's statement that the Waterfront Substation has an existing demand of 180.3 MVA is incorrect. The justification appears to be relying on load projections from the 2021 and 2022 Load Forecast[21] and not Pepco's current load forecast for this substation.

In the 2023 load forecast, Pepco is projecting 164.9 MVA in 2023 and 181 MVA by 2027 as shown in the following graph and the peak load is projected to continue to be at 180.4 MVA through 2032.[22] With a peak load of only 180.4 MVA and firm capacity at the substation of 216 MVA, a fifth transformer is not warranted for the Waterfront Substation.

---

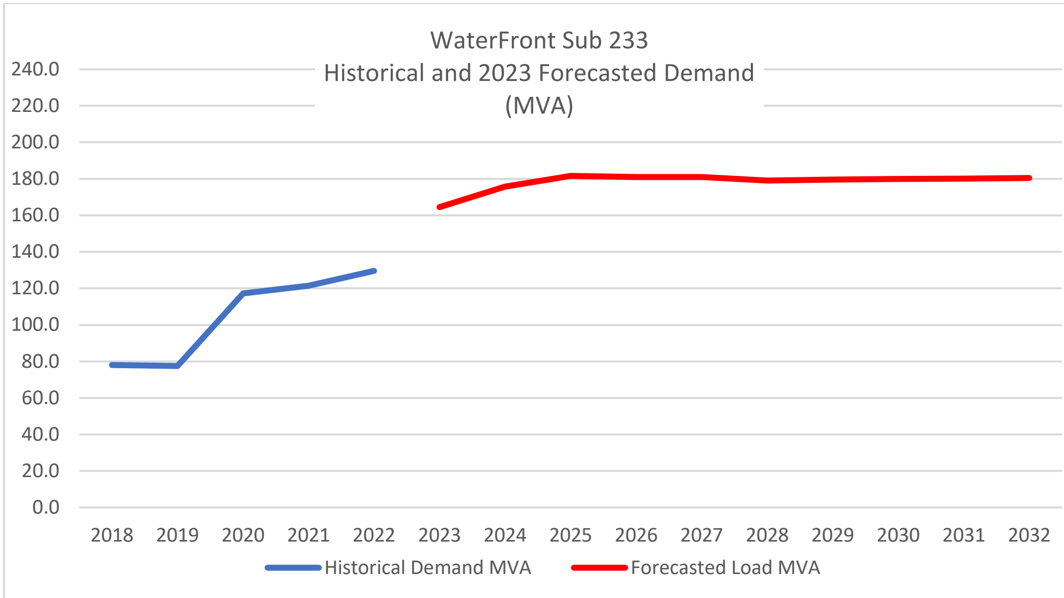
[18] Exhibit Pepco (H)-2 at page 22 of 216.

[19] Exhibit Pepco (H)-2 at page 22 of 216.

[20] Exhibit OPC (E)-7 at page 3 (*Formal Case No. 1176*, Pepco Response to DCG Data Request 5-1).

[21] Exhibit OPC (E)-8 at page 28 (*PEPACR 2021-01*, 2021 Annual Consolidated Report ("2021 ACR")); and Exhibit OPC (E)-9 at page 25 (*PEPACR 2022-01*, 2022 Annual Consolidated Report ("2022 ACR")).

[22] Exhibit OPC (E)-10 at page 3 (*Formal Case No. 1176*, Pepco Response to DCG Data Request 5-2).



Q. DO YOU HAVE ANY CONCERNS WITH PREVIOUS CAPACITY EXPANSIONS AT THE WATERFRONT SUBSTATION?

A. Yes. In 2019, Pepco justified a 4th transformer at the Waterfront Substation stating the firm capacity of the station was 114 MVA and the projected load by the summer of 2019 was anticipated to be 147 MVA.[23] The actual peak load at the Waterfront substation in 2019 was 103.1 MVA and the peak load in 2022 was only 129.6 MVA.[24] In fact, the load at the Waterfront Substation has never exceeded 147 MVA.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE ALABAMA SUBSTATION NO. 136?

---

[23] Exhibit OPC (E)-11 at page 3 (Excerpt from *Formal Case No. 1156*, DC Construction Report, Pepco Exhibit (I)-2).

[24] Exhibit OPC (E)-7 at page 3 (Pepco Response to DCG Data Request 5-1).

A. I recommend that ITN 77270 and ITN 77272, which are projects designed to allow for the capacity expansion at the Alabama Substation, be excluded from the MYP which would reduce the capital budget by $6,131,179. Pepco's justification for these projects is that the Alabama Substation No. 136 will be overloaded in 2028.[25] The firm capacity of the existing Alabama Substation is 165 MVA. There are two projects that Pepco believes are necessary to solve this overloaded condition: (i) ITN 77270: Pepco-High Side Bus Land; and (ii) ITN 77272 Pepco 230kV High side-Bus at a cost of $3,647,190 and $2,484,600 respectively.[26] The 2021 and 2022 Load Forecasts projected loads approaching or exceeding 165 MVA;[27] however, Pepco's 2023 Load Forecast for this substation through 2032 does not exceed 143 MVA[28] as shown in the following graph. The current forecasted load of 143 MVA through 2032 therefore does not justify a capacity expansion in 2028.

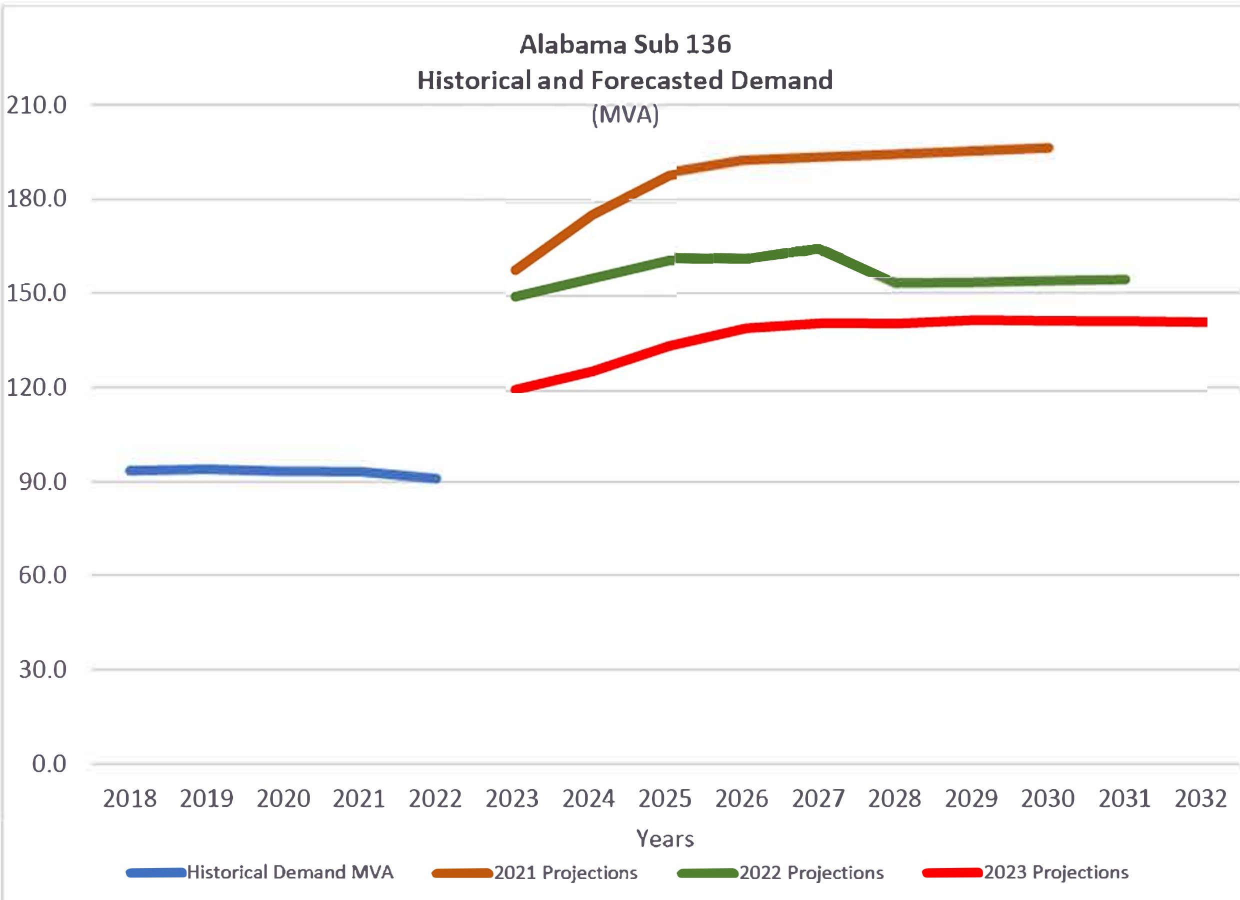
---

[25] Exhibit Pepco (H)-2 at page 23 of 216.

[26] Exhibit Pepco (H)-2 at pages 23 and 24 of 216.

[27] Exhibit OPC (E)-8, 2021 ACR, at page 28; Exhibit OPC (E)-9, 2022 ACR, at page 25.

[28] Exhibit OPC (E)-10 at page 3 (Pepco Response to DCG Data Request 5-2).



I recommend that the total cost of these projects and the associated $6,031,790 in budgeted capital expense be removed from the MYP budget in the event that the Commission approves a multi-year rate in this proceeding.

Q. ARE YOU AWARE OF ANY CAPITAL COSTS INCLUDED IN THE COMPANY'S CAPITAL BUDGET THAT WERE INCURRED IN MARYLAND AND SHOULD NOT BE CHARGED TO THE DISTRICT?

A. Yes. Through discovery in this proceeding, I learned that the proposed White Flint Substation (ITN 74120) is located in Maryland and portions not chargeable to the District ratepayers were inappropriately included in the Company's proposed rates in this proceeding.[29] Also, the proposed National Harbor Sub (ITN 72730) is also located in Maryland and is not chargeable to District ratepayers and should be removed from any MYP budget approved in this proceeding.[30]

Q. DO YOU HAVE A RECOMMENDATION REGARDING THE DISTRIBUTION COSTS OF THE WHITE FLINT SUBSTATION?

A. Yes. I recommend that ITN 74120 White Flint New Substation 69/13kV be modified such that the distribution costs are directly assigned to Pepco's Maryland jurisdiction and the subtransmission costs are allocated to between the District and Maryland using the AED-NCP allocator. ITN 74120 calls for a new substation to be located in Maryland.[31] The 69kV components which are chargeable to FERC plant accounts 350 through 359 would be allocated between the District and Maryland. The substation costs and the distribution costs which are chargeable to FERC accounts 362 through 373 would be solely assignable to Maryland. My recommendation is consistent with Pepco's response to OPC Data Request 4-73 which states that "[t]he cost of the sub transmission components is recoverable in this rate case using the Average and Excess Non-coincident Peak Demand

---

[29] Exhibit OPC (E)-12 at page 1 (*Formal Case No. 1176*, Pepco Response to OPC Date Request 4-73).

[30] Exhibit OPC (E)-13 (*Formal Case No. 1176*, Pepco Response to OPC Data Request 4-72).

[31] Exhibit Pepco (H)-2 at page 172 of 216.

(AED-NCP) allocation method, as referenced at 4-74(a). The cost of the distribution components is not recoverable in this rate case."[32] The breakdown in costs is as follows.

		74120: White Flint New Substation 69/13kV		
	2022A	**2023B**	**2024B**	**2025B**
Capital Expenditures (PEPCO) (H)-2, page 172	--	$2,634,643.00	$520,422.00	$63,135.95
Remove Maryland Direct Distribution Costs	--	($395,196.45)	($78,063.30)	($9,470.46)
PEPCO Sub Transmission Costs		$2,239,446.55	$442,358.70	$53,665.55
Apply AED-NCP Allocator	--	0.4031	0.4031	0.4031
Distribution Cost Allocated to the District	--	$902,720.90	$178,314.79	$21,632.66

Based on my calculation, the required budget reduction to remove the allocated cost to the District is $159,303 in 2023, $31,467 in 2024 and $3,817 in 2025.

Q. DO YOU HAVE A RECOMMENDATION REGARDING THE NATIONAL HARBOR SUBSTATION?

A. Yes. I recommend that ITN 72730 National Harbor Sub – New 69/13 Dist Sub[33] which is located outside of the District be excluded from any MYP budget approved in this proceeding. Pepco agreed that this project was inadvertently tagged as a subtransmission project and should not be included in this rate case.[34] The breakdown in costs is as follows.

[32] Exhibit OPC (E)-12 at page 1.

[33] Exhibit Pepco (H)-2 at page 171 of 216.

[34] Exhibit OPC (E)-13 at page 1.

		72730: National Harbor Sub – New 69/13 Dist Sub			
	2022A	**2023B**	**2024B**	**2025B**	**2026B**
Capital Expenditures (PEPCO) (H)-2, page 172	--	$576,520	$1,796,040	$2,990,010	$4,816,990
Remove Maryland Direct Distribution Costs	--	($576,520)	($1,796,040)	($2,990,010)	($4,816,990)
PEPCO Sub Transmission Costs		$0	$0	$0	$0
Apply AED-NCP Allocator	--	0.4031	0.4031	0.4031	0.4031
Distribution Cost Allocated to the District	--	$0	$0	$0	$0

Based on my calculation, the required budget reduction to remove the allocated cost to the District is $232,395 in 2023, $723,984 in 2024, $1,205,273 in 2025, and $1,941,729 in 2026.

Q. ARE YOU AWARE OF ANY BATTERY ENERGY STORAGE SYSTEMS PROPOSED IN THIS MULTI-YEAR PLAN?

A. Yes. Pepco Witness Cantler states in her direct testimony that Pepco has two proposed battery storage projects.[35] She states that battery energy storage technology is a safe and sustainable energy solution and a promising alternative for providing temporary capacity relief with a zero-carbon footprint.[36] The two battery energy storage systems ("BESS") include a 1MW/3MWh unit at the Alabama Substation and a unit at the Mt. Vernon Substation. Battery storage used as described in Pepco's justification are often referred to

[35] Exhibit Pepco (H) (Cantler) at 10:6-7.

[36] Exhibit Pepco (H) (Cantler) at 10:7-9.

as non-wire alternatives ("NWAs"). NWAs are investments that can deter or replace the need for specific substation and/or distribution projects, at lower total resource cost.

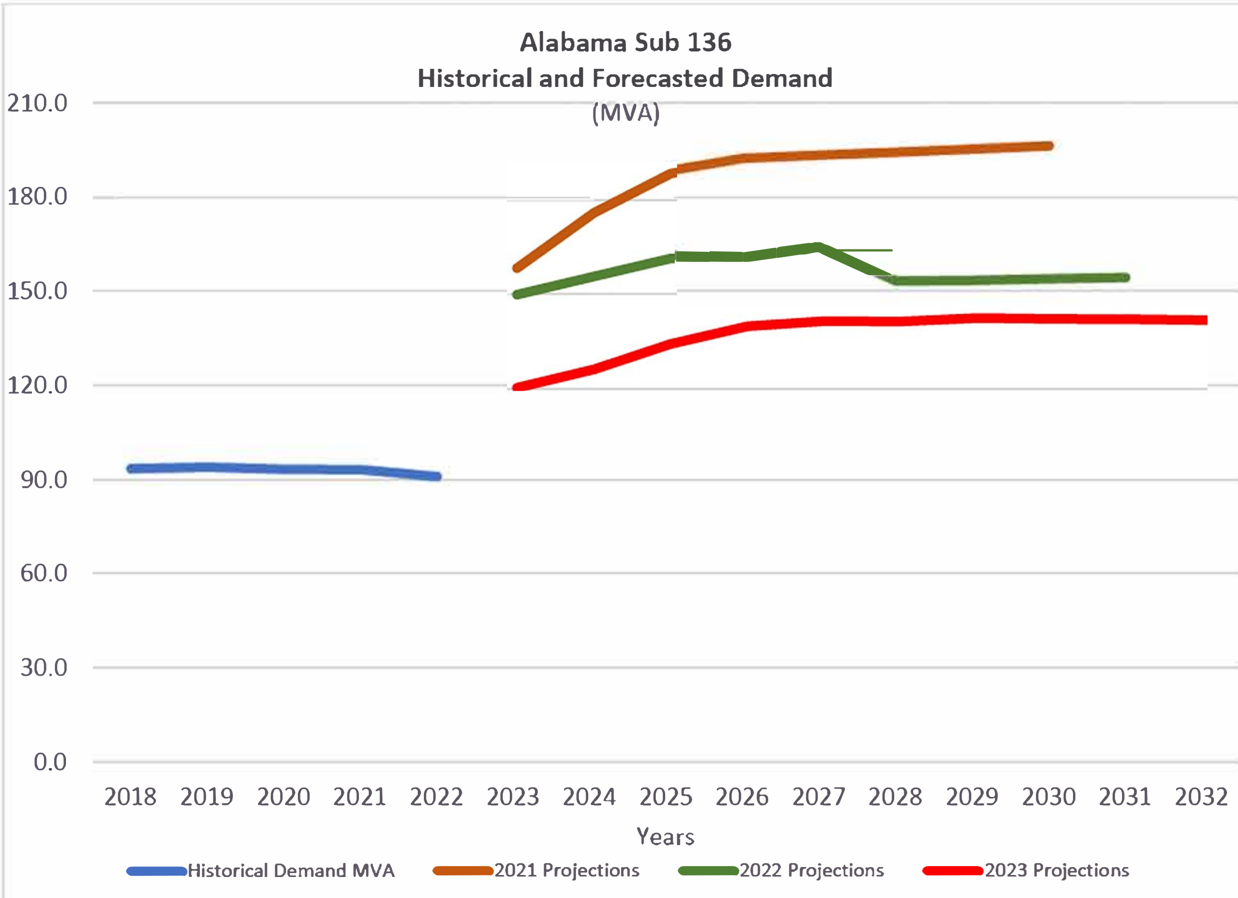
Q. IN YOUR OPINION, IS THE BESS UNIT AT ALABAMA SUBSTATION NECESSARY?

A. No. Pepco notes load growth from major development projects in the Ward 8 area will result in the Alabama Ave. Substation experiencing a capacity overload. The proposed battery storage was initially justified as a means to delay the need for capacity increases at the Alabama Ave. Substation.[37] However, the current load forecasts for the Alabama Ave. Substation do not require the capacity of these proposed batteries to defer upgrades at the substation. The load forecasts in 2021 and 2022, projected future loads that could result in loads beyond the current firm capacity of the substation of 165 MVA. Pepco's new load forecasting method now shows a significant reduction in the projected load for this area in Ward 8.[38] The following graph compares the historical loads and forecasted loads from the 2021, 2022 and 2023 forecasts.

---

[37] Exhibit Pepco (H)-2 at page 2 of 216.

[38] Exhibit OPC (E)-10 at page 3.



Further, Pepco's "Construction Recommendations-Distribution Systems: Construction Recommendations Distribution Systems 2024-2025," dated April 1, 2023, contains **[BEGIN CONFIDENTIAL]** [redacted]

39 Exhibit OPC (E)-14 at page 6, Pepco Response to OPC Data Request 4-32, Confidential Attachment E.

[redacted] **[END CONFIDENTIAL]**.[40]

As I have stated, based on current load projections, there is no need for a BESS at the Alabama Substation. Therefore, in my opinion, a NWA alternative is not required for this substation or for Feeder 15166.

Q. WHAT IS YOUR OPINION REGARDING THE PROPOSED BATTERY AT THE ALABAMA SUBSTATION?

A. In Order No. 20274, the Commission suggested that Pepco develop a NWA project in order to defer a new substation in Ward 8, which was projected to be needed in the 2026-2028 timeframe.[41] In response to Order No. 20274, Pepco noted that BESS would both help defer the Ward 8 substation and defer a feeder upgrade in the area.[42] Obviously, Pepco's load forecast has changed and a BESS installed in Ward 8 will not defer any required capacity upgrades. Pepco stated in response to an OPC discovery request that the project will "mitigate voltage drop violations during peak load conditions and using the

---

[40] Exhibit OPC (E)-14 at page 3.

[41] *Formal Case No. 1144, In the Matter of the Potomac Electric Power Company's Notice to Construct Two 230kV Underground Circuits From the Takoma Substation to the Rebuilt Harvard Substation, And From the Rebuilt Harvard Substation to the Rebuilt Champlain Substation (Capital Grid Project)* ("*Formal Case No. 1144*), Order 20274 ¶ 95, rel. December 20, 2019 ("Order No. 20274").

[42] Exhibit OPC (E)-15 at page 3 (*Formal Case No. 1144*, Pepco's Response to Order 20274, dated June 17, 2020).

capabilities of the battery to augment emergency transfers in response to storms."[43] While Pepco has identified a modest benefit to continuing with the BESS at the Alabama Substation, in the absence of any capacity deferral value, I believe that Pepco should pivot and delay indefinitely the BESS planned for the Alabama Substation.

Q. WHAT IS YOUR RECOMMENDATION FOR THE BESS COSTS INCLUDED IN THE CAPITAL BUDGET FOR THE ALABAMA SUBSTATION?

A. I recommend that costs budgeted for the years 2024 to 2026 be removed from the multi-year plan. The costs total $6,269,000.

	($'s in '000s)		
ITN Name	**2024B**	**2025B**	**2026B**
62900: Pepco Alabam Av. Sub 136 Feeder 15166 Battery Substation	$ 2,038.1	$ 2,258.6	$ 62.1
62935: Pepco Alabama Ave Sub 136 Feeder 15166 Battery Distribution	$ 300.7	$ 1,118.4	$ 35.9
63208: Pepco Alabama Ave Sub 136 Feeder 15166 Fiber/Telecom	$ 316.0	$ 77.7	$ 62.1
Total	$ 2,655	$ 3,455	$ 160
Total 2024 to 2026	$ 6,269		

Q. CAN YOU EXPLAIN PEPCO'S JUSTIFICATION FOR THE BESS UNIT AT THE MOUNT VERNON SUBSTATION?

A. Yes. Pepco's justification for the BESS unit at Mr. Vernon (ITN 67364) has three parts:

1. More non-wire solutions to align with DC's CleanEnergy Act,
2. Defer the capital expenditure for the 4th Mt. Vernon transformer in accordance with DC PSC Order 20274, and
3. Demonstrate learnings from this project.[44]

---

[43] Exhibit OPC (E)-16 (*Formal Case No. 1176*, Pepco Response to OPC Data Request at 8-5).

[44] Exhibit Pepco (H)-2 at page 9 of 216.

In Order No. 20274, the Commission stated the "[g]iven that the new transformer will not be needed until 2028, we direct Pepco to use best efforts to expand the 1 MW pilot battery project at the Mt. Vernon Substation during this time to defer or eliminate the need for the transformer."[45] However, as I will demonstrate, the facts are now such that a fourth transformer will not be required through 2032 and the BESS will have limited value.

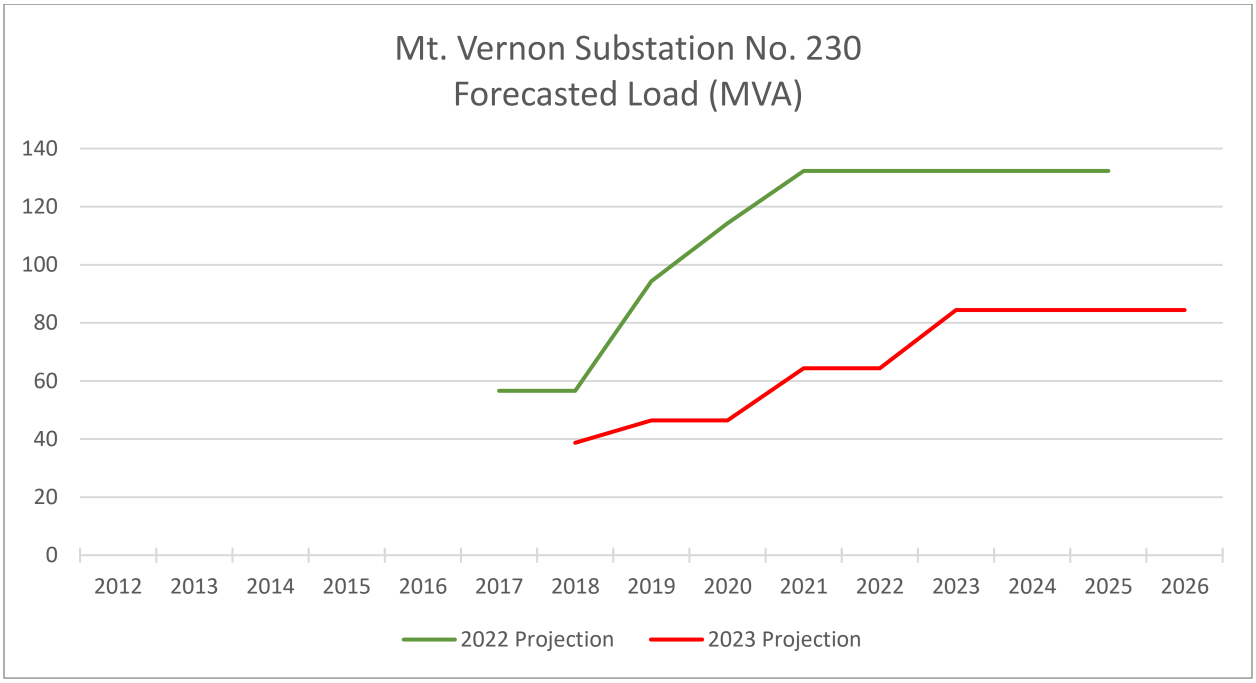
Q. IS THE BESS NEEDED TO DEFER A CAPITAL UPGRADE AT MT. VERNON SUBSTATION?

A. No. The Mt. Vernon Substation No. 230 will have an initial rating of 140 MVA[46] and the ten year forecasted peak demand[47] for this substation does not exceed 84.4 MVA as shown in the following graph.

[45] Order No. 20274 at ¶ 94.

[46] Pepco Exhibit (H)-2 at page 15 of 216.

[47] Pepco Exhibit (H)-1 at page 13 of 75.



In 2018 Pepco believed that the Mt. Vernon Triangle, NoMa, Capitol Crossing, and Northwest One areas (currently served by Florida Avenue Substation, New Jersey Avenue Substation, Northeast Substation and Tenth Street Substation) would see new growth of approximately 126 MW over the next ten years.[48] The updated version of the potential new businesses for the area is down to approximately 54 MW through 2026[49] with some projects complete, some in construction, and some delayed or terminated. With all these revised loads accounted for in the projections, the peak load at the Mt. Vernon Substation

---

[48] Exhibit OPC (E)–26 at pages 17-18 (*Formal Case No. 1130 and 1144*, Reply Comments of Potomac Electric Power Company, filed June 29 2018) ("The Mt. Vernon Triangle, NoMa, Capitol Crossing, and Northwest One areas (currently served by Florida Avenue Substation, New Jersey Avenue Substation, Northeast Substation and Tenth Street Substation) are and will be experiencing significant new growth, with approximately 126 MW of load from 132 new developments scheduled to be added over the next ten years.").

[49] Exhibit OPC (E)-17, *Formal Case No. 1176*, Pepco Response to OPC Data Request 4-9. The Total Station PNB Load totals reported on page 13 of Exhibit OPC (E)-17 total to 54.202 MW.

will not exceed 84.4 MW by 2032. A fourth transformer is not required until the load approaches the firm capacity of the substation, and this will not occur prior to 2032.

Q. ARE THERE ANY OTHER RATIONALES FOR THE BESS AT THE MOUNT VERNON SUBSTATION?

A. The Commission asked Pepco to file plans and implementation details for a BESS at the Mt. Vernon Substation in Order No. 20274[50] and Pepco responded that the Company was committed to fulfilling the Commission's directive regarding battery storage to defer a fourth transformer at the Mt. Vernon Substation.[51]

Q. **IN YOUR OPINION, IS THAT RATIONALE STILL VALID?**

No. Order No. 20274 was issued at a time when the assumption was that the battery would defer a fourth transformer, but now there is no need to defer a capacity increase at the substation. I believe that these prior commitments should be adjusted to current load projections and the BESS be deferred or eliminated. Further, Pepco stated that by installing the BESS later than 2024, it would be possible to take advantage of technology advancements and reduce the degradation of its capacity that will occur from repeated use of the battery prior to the need to use the battery for deferral purposes.[52] Given that an additional transformer at the Mt. Vernon Substation will not be needed through 2032, I

---

[50] Order No. 20274 at ¶ 94.

[51] *See* Exhibit OPC (E)-18 at page 2 (*Formal Case No. 1144*, Pepco's 90-day Compliance filing pursuant to Order No. 20274, dated March 19, 2020. The Office notes that Pepco's cover letter indicates that the Company was filing in response to Order 20203, but this appears to be in error).

[52] Exhibit OPC (E)-18 at page 2.

recommend not installing the battery system until it is needed at the Mt. Vernon Substation or a more suitable location is identified.

Q. IN YOUR OPINION, WILL A BESS LOCATED AT THE MT. VERNON SUBSTATION PROVIDE EXPERIENCE FOR PEPCO TO OPERATE A BESS ON THE UTILITY SIDE OF THE METER?

A. Yes, it could provide additional experience, but it is not necessary. Pepco does not need the experience in the District because Pepco is part of the larger Exelon organization which already operates battery systems on other distribution systems. Pepco is operating some utility scale battery systems in Maryland including one at National Harbor and another at a Montgomery County Electric Transit Bus depot in Silver Spring.[53] Therefore it is not necessary to spend over six million dollars to learn about battery systems in the District when Pepco already has this operating experience.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE PROPOSED BESS AT THE MT. VERNON SUBSTATION?

A. I recommend that ITN 67364: Pepco Mt. Vernon Battery Energy Storage System be delayed indefinitely and the budgeted cost in 2024 of $4,466,410 removed from the MYP budget.

Q. REGARDING THE DOWNTOWN RESUPPLY PROJECT, DO YOU HAVE ANY RECOMMENDATIONS?

---

[53] Exhibit OPC (E)-19, Presentation by Exelon at the PJM Emerging Technology Forum January 11, 2020.

A. Yes. I recommend the following projects be excluded from the MYP capital budget.

ITN Name
68678: L. St Rebuild Distribution Work
72137: L St Sub Capacity Expansion Work
80130: Pepco DC Buzzard to F Street
80425: Pepco DC F Street to Georgetown
80427: Pepco Champlain to L Street 69kV
80740: Pepco DC Champlain to F Street
68612: Pepco DC L St T1 Replacement
68613: Pepco DC L St T2 Replacement
68614: Pepco DC L St T3 Replacement
68615: Pepco DC L St T4 Replacement
71630: F St Sub Rebuild (69kV) (UDSPLM718A)
71631: F St Sub Rebuild (UDSPLM717A)
73368: Champlain Bypass
71012: Champlain - New 69kV Sub (DSPRD8AD17)

These projects represent a fundamental change from the Downtown Resupply that Pepco first proposed as part of the Capital Grid Plan[54] and have not been sufficiently justified for the total cost of the projects. The Office's proposed cost reductions are detailed in my Exhibit OPC (E)-20. Further, these changes are only the start of substantial changes for the feeds from the Potomac C Substation and potentially from a new Livingston Substation.

Q. CAN YOU DESCRIBE PEPCO'S DOWNTOWN RESUPPLY PROJECT?

A. Yes. The Downtown Resupply Project ("DRP") was first included in *Formal Case No. 1144* as an ancillary project to the Company's Capital Grid Project. As conceived in 2018, the DRP project used the Champlain Substation as a source to re-feed Georgetown, and F Street with 69kV cables and L Street with 35kV cables. In turn, the Company planned to

[54] Exhibit OPC (E)-21, *Formal Case No. 1144*, Pepco's 180-Compliance filing Pursuant to Order 20203, dated February 4, 2020.

retire older 69kV pipe-type cables from the Potomac River Substation to Georgetown Substation and from Georgetown Substation to the F Street Substation. In addition the older 35kV cables from Buzzard Point Substation to the L Street Substation would be retired with the addition of the new 35kV cables from the Champlain Substation. The F Street Substation would be re-built, and capacity increased at L Street Substation. In addition, this work would allow for the retirement of the I Street Substation which resides on leased property. Finally, the 22nd Street Substation would be re-fed from the 69kV cables currently serving the I Street Substation. These cables originate at the Potomac C Substation and extend via two different routes to the 9th Street Substation and extend further to the I Street Substation. This work will allow for the Takoma to Champlain 69kV cables to be retired. The following diagram[55] shows the current configuration of sub-transmission feeds to these stations. **[BEGIN CONFIDENTIAL]**

[55] Exhibit OPC (E)-22 at page 22, *Formal Case No. 1176*, Pepco Response to OPC Data Request 4-20, Confidential Attachment Z.

[redacted]

[redacted]

2 **[END CONFIDENTIAL]**

Attachment Z, page 23 of 35.

In 2022 Pepco changed the permanent feed to the L Street Substation from 35kV to 69kV.[57] The total projected cost for the DRP was $494 million as detailed in the 2022 Annual Consolidated Report.

WSB	Downtown Resupply Project	Life Cycle Cost
UDLPLM7W27	13kV cutover F to L	$ 39,849,304
UDLPLM7W28	13kV cutovers I to F & L	$ 32,434,952
UDLPRM4WA8	Champlain to L street 34kV	$ 102,319,736
UDSPLM718A	F St Sub Rebuild (69kV)	$ 50,372,188
UDSPLM717A	F St Sub Rebuild	$ 33,581,458
UDSPLM722A	L St Sub Capacity Expansion	$ 4,011,558
UDLPRM5SG	Repl 69kV UG Supl-Georgetown, F St, 22nd St Subs	$ 177,223,136
UDSPR27RD	Retire I St Sub	$ 2,081,496
UDLPRM4RDR	Retirements Downtown resupply 34kV and 69kV for DC	$ 35,522,470
UDLPRM4RDM	Retirements Downtown resupply 34kV and 69kV for MD	$ 1,309,199
UDLPRM4RDV	Retirements Downtown resupply 34kV and 69kV for VA	$ 13,322,712
UDFPO22SS	Telecom 22nd St	$ 500,000
UDFPOCL01	Telecom Fiber for 34-69kV resupply Champlain, L and F	$ 500,000
UDFPOGS01	Telecom - Georgetown Sub	$ 500,000
UDFPOLS01	Telecom - L Street Sub	$ 500,000
		$ 494,028,209

Q. WHAT IS YOUR UNDERSTANDING OF THE NEED FOR THE DOWNTOWN RESUPPLY PROJECT?

A. In my opinion, the primary reason for the DRP is for reliability due to aging 69kV cables and the fact that many of these cables cross under the Potomac River. These older cables are pipe-encased-type cables that use oil around the cable for cooling and maintaining capacity levels of the cables. As these cables age there is a concern of leaking oil. Newer 69kV cables are solid di-electric cables that do not require oil for cooling.

57 Exhibit OPC (E)-9 at page 315 (2022 ACR, Attachment F at page 2 of 3).

Q. DOES THE DRP PROJECT INCREASE RELIABILITY RESILIENCY?

A. The answer is very subjective but simply put, I would say no. Most utilities, including Pepco, design the 35kV and 69kV systems with contingency capacity often referred to as N-1 meaning with the loss of one system component, the system can continue to serve the load. The existing system meets this criterion, however as components age, they must be renewed. In this case, rather than renewing existing infrastructure, Pepco is building a system to serve the same load with the same N-1 contingency. The new system reduces the number of river crossings and will help Pepco fix cables more quickly, which is the main advantage of the DRP system.

Q. IN YOUR OPINION HAS PEPCO BEEN TRANSPARENT WITH RESPECT TO THE CHANGES PROPOSED TO THE DOWNTOWN RESUPPLY PROJECT?

A. In my opinion, Pepco has not been transparent. In fact, the 2023 ACR filed on April 18, 2023, makes no mention of the changes to the Downtown Resupply Project that are now included in the MYP that was also filed in April 2023.

Q. CAN YOU DESCRIBE PEPCO'S NEW LONG RANGE PLAN FOR RE-SUPPLYING THE SUBSTATIONS INCLUDING GEORGETOWN, F STREET, L STREET, 22ND STREET, AND 9TH STREET SUBSTATIONS?

A. Yes, I can describe the plan as presented in Pepco's confidential response to OPC Data Request 4-21.[58] **[BEGIN CONFIDENTIAL]** [redacted]

[58] Exhibit OPC (E)-23, Pepco Response to OPC Data Request 4-21(a), Confidential Attachment.

[redacted]

59 Exhibit Pepco (H)-2 at page 197 of 216.

[redacted]

[redacted]

[END CONFIDENTIAL]

Q. IN YOUR OPINION HAS PEPCO JUSTIFIED STAGE 1 OF THE REVISED DOWNTOWN RESUPPLY PLAN?

A. No. Witness Cantler did not mention the changes to the DRP in her direct testimony. Also, the justification in the individual projects (*i.e.*, Project ITN 80130: Buzzard to F Street

69kV cables; Project ITN 80245: Pepco DC F Street to Georgetown; ITN 80740: Pepco DC Champlain to F Street; ITN 80247: Pepco Champlain to L Street 69kV; ITN 71631: F St Sub Rebuild; and ITN 72137: L St Sub Capacity Expansion Work), do not clearly explain the master plan and total cost envisioned by Pepco for the Stage 1 and Stage 2 modifications. For instance, ITN 71631: F St Sub Rebuild still calls for 4 cables from the Champlain Substation.[60] Further these projects require that the Buzzard Point 230/69kV Substation be relocated starting in roughly 2027, however, the current budgets do not indicate or justify this relocated substation project. In fact, all of the following ITN projects reference a relocated Buzzard Point 69kV Substation: ITN 68678, ITN 70096, ITN 72137, ITN 80130, ITN 71630, and ITN 71631.[61] This scant justification is not sufficient to start down the road of the revised downtown resupply that will result in an additional $712 million for sub-transmission and substation expenditures that will be borne by District ratepayers.

In addition, it is my understanding that Pepco will need to file a Notice of Construction (NOC) for the 230 kV cables required for a relocated Buzzard Point Substation. However, once the 69kV cables are installed from F Street Substation to Buzzard Point Substation, the review of the NOC will be arguably a fait accompli because a considerable portion of

[60] Exhibit Pepco (H)-2 at page 152 of 216.

[61] Exhibit Pepco (H)-2 at pages 10, 11, 14, 92, 151, and 152 of 216. Specifically, the Solution Statement for these projects provides: "Resupply 22nd Street, F St and Georgetown via Champlain 69kV new 230/69kV sub and Buzzard Point 69kV relocated sub to inside the generation building."

the project will already be in place and considerable spending will have already occurred through the MYP budget.

Q. DOES THE STAGE 1 LONG-TERM DOWNTOWN DC PLAN OR THE DOWNTOWN RESUPPLY PROJECT INCREASE SYSTEM CAPACITY?

A. No. The retirement of the I Street Substation and the Champlain Substation reduces firm capacity by 246 MVA. The L Street and F Street Substation will have capacity increases of 78 MVA and 55 MVA resulting in a net increase for these two stations of 133 MVA. Some of the capacity from Champlain Substation is being absorbed by other adjacent substations, but the substation capacity of these Downtown substations will not be increased.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE DOWNTOWN RESUPPLY PLAN?

A. As I previously stated, I recommend that all projects that modify the 69kV cables and substation equipment associated with modified Downtown Resupply Plan be eliminated from the MYP because Pepco has not justified the modified plan. The list of those projects to exclude are contained in my Exhibit OPC E–(20).

IV. CONCERNS REGARDING PEPCO'S TRADITIONAL TEST YEAR CONSTRUCTION EXPENSE AND CAPITAL INVESTMENTS

Q. WHAT IS YOUR UNDERSTANDING OF THE TRADITIONAL TEST YEAR PERIOD?

A. My understanding is the test year would be the 12 months ending December 2023, with six months of known expenditures and six months of projected expenditures.

Q. IN YOUR OPINION, ARE THERE ANY PROJECTS IN THE TEST YEAR THAT SHOULD BE EXCLUDED?

A. Yes. Project ITN 70096: 13kV Distribution Cutovers "F' St to "L" St. has a budget of $9,527,130 in 2023. Pepco, however, has stated that "[n]o portion of this project will be completed within the test year."[62] Therefore the costs associated with this project should be excluded from the traditional test year revenue requirement as this project will be not be providing benefits to ratepayers. Also, Project 80906: Pepco DDOT Bridge 78 Relocation - 69kV pipe type has a budget of $7,972,280. Again, Pepco has stated that "[n]o portion of this project will be completed within the test year."[63] Therefore these costs should also be excluded from the traditional test year revenue requirement.

Q. YOU PREVIOUSLY DESCRIBED YOUR CONCERNS ABOUT THE LACK OF JUSTIFICATION FOR THE DOWNTOWN RESUPPLY PROJECT. HOW DO THESE CONCERNS RELATE TO THE TRADITIONAL TEST YEAR?

A. I recommend that all projects that modify the 69kV cables and substation equipment associated with the modified Downtown Resupply Plan be eliminated from the MYP because Pepco has not justified the modified plan. For the same reasons and the lack of justification, I recommend these projects that modify the 69kV cables and substation equipment be eliminated from the traditional test year revenue requirement. These costs are detailed in the following table.

---

[62] Exhibit OPC (E)-24 (*Formal Case No. 1176*, Pepco Response to OPC Data Request at 11-3).

[63] Exhibit OPC (E)-25 (*Formal Case No. 1176*, Pepco Response to OPC Data Request at 11-4).

Downtown Resupply Projects to be Eliminated from the Test Year

ITN Name	$s in '000s 2023B	
64195: Pepco Champlain Rebuild - 13 kV Champlain Load Transfers	$	3,388
68678: L St Rebuild Distribution Work	$	269
72137: L St Sub Capacity Expansion Work	$	4,449
80130: Pepco DC Buzzard to F Street	$	270
80425: Pepco DC F Street to Georgetown	$	852
80427: Pepco Champlain to L Street 69kV	$	1,179
80740: Pepco DC Champlain to F Street	$	1,482
68612: Pepco DC L St T1 Replacement	$	746
68613: Pepco DC L St T2 Replacement	$	714
68614: Pepco DC L St T3 Replacement	$	192
68615: Pepco DC L St T4 Replacement	$	197
71630: F St Sub Rebuild (69kV) (UDSPLM718A)	$	709
71631: F St Sub Rebuild (UDSPLM717A)	$	540
73368: Champlain Bypass	$	1,790
71012: Champlain - New 69kV Sub (DSPRD8AD17)	$	831
Total	**$**	**17,609**

Q. YOU PREVIOUSLY DESCRIBED YOUR CONCERNS ABOUT DISTRIBUTION AND SUBTRANSMISSION COST ALLOCATIONS BETWEEN MARYLAND AND THE DISTRICT. HOW DO THESE CONCERNS RELATE TO THE TRADITIONAL TEST YEAR?

A. The costs that were not allocated properly should be excluded from the traditional test year revenue requirement. As I previously explained, the proposed White Flint Substation (ITN 74120) is located in Maryland and portions not chargeable to the District ratepayers were inappropriately included in the Company's proposed rates in this proceeding.[64] The

[64] Exhibit OPC (E)-12.

proposed National Harbor Sub (ITN 72730) is also located in Maryland and is not chargeable to District ratepayers and should be removed from any test year costs.[65] The total negative adjustment to the test year is $395,196 for the White Flint Substation and $576,520 for the National Harbor Substation.

Q. YOU PREVIOUSLY DESCRIBED THE IMPACT OF THE CLIMATE PLAN UPGRADES AND SPECIFICALLY THE ADMS SYSTEMS. IN YOUR OPINION, SHOULD THE ADMS SYSTEMS BE INCLUDED IN A TRADITIONAL TEST YEAR FOR RATE MAKING?

A. Yes. The core purpose of the ADMS is replacement of older information control technologies including Pepco's outage management system, remote control of downline devices, and GIS mapping capabilities. The cost of replacing and upgrading older technologies have historically been recovered through traditional rate cases. As I have noted above, it is the ADMS Convergence Stage 2.0 project and advanced DERMS implementation projects included in the MYP that have not been justified from an engineering perspective.

V. CONCLUSION

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

EXPERTISE

Overhead & Underground Distribution Design

Distribution System Planning

Power System Modeling & Analysis

Training

PROFILE

Mr. Mara has over 30 years of experience as a distribution engineer. He worked six years at Savannah Electric as a Distribution Engineer and ten years with Southern Engineering Company as a Project Manager. At Savannah Electric, Mr. Mara gained invaluable field experience in the operation, maintenance, and design of transmission and distribution systems. While at Southern Engineering, Mr. Mara performed planning studies, general consulting, underground distribution design, territorial assistance, and training services. Presently, Mr. Mara is a Vice President at GDS Associates, Inc. and serves as the Principal Engineer for GDS Associates' engineering services company known as its trade name Hi-Line Engineering.

Overhead Distribution System Design. Mr. Mara has developed underground specifications for utilities and was an active participant on the Insulated Conductor Committee for IEEE. He has designed underground service to subdivisions, malls, commercial, and industrial areas in various terrains. These designs include concrete-encased ductlines, direct-burial, bridge attachments, long-bores, submarine, and tunneling projects. He has developed overcurrent and overvoltage protection schemes for underground systems for a variety of clients with different operating parameters.

Underground Distribution System Design. Mr. Mara has developed underground specifications for utilities and was an active participant on the Insulated Conductor Committee for IEEE. He has designed underground service to subdivisions, malls, commercial, and industrial areas in various terrains. These designs include concrete-encased ductlines, direct-burial, bridge attachments, long-bores, submarine, and tunneling projects. He has developed overcurrent and overvoltage protection schemes for underground systems for a variety of clients with different operating parameters.

TRAINING SEMINARS

Mr. Mara has developed engineering training courses on the general subject of distribution power line design. These seminars have become extremely popular with more than 25 seminars being presented annually and with more than 4,000 people having attended seminars presented by Mr. Mara. A 3-week certification program is offered by Hi-Line Engineering in eleven states. The following is a list of the training material developed and/or presented:

- Application and Use of the National Electric Safety Code
- How to Design Service to Large Underground Subdivisions
- Cost-Effective Methods for Reducing Losses/Engineering Economics
- Underground System Design
- Joint-Use Contracts – Anatomy of Joint-Use Contract
- Overhead Structure Design
- Easement Acquisition
- Transformer Sizing and Voltage Drop

Construction Specifications for Electric Utilities. Mr. Mara has developed overhead construction specifications including overhead and underground systems for several different utilities. The design included overcurrent protection for padmounted and pole mounted transformers. The following is a representative list of past and present clients:

- Cullman EMC, Alabama
- Blue Ridge EMC, South Carolina
- Buckeye Rural Electric Cooperative, Ohio
- Three Notch EMC, Georgia
- Little River ECI, South Carolina
- Lackland Air Force Base
- Maxwell Air Force Base

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 4

QUESTION NO. 1
Referencing the testimony presented by Witness Cantler at page 5, lines 20-23 and the statement that "[t]he Company's investments during this MYP period are implemented to advance and support various Company objectives such as driving solutions to address climate change, enhancing grid performance, improving social equity and affordability, and looking for new opportunities to enhance customer experience."

a. For each of the identified objectives, explain how the Company intends to measure the Company's performance relative to the stated objective. Provide any objective criteria that the Company proposes to use to measure the success of the MYP period projects in achieving the stated objectives.

b. Provide a breakdown to the MYP projects sorted by the Company objectives that they are intended to advance and support.

c. Provide any cost-benefit analyses performed with respect to the cost of the MYP period projects and the benefits to ratepayers.

RESPONSE:

a. The Company does not have internal metrics in place for measuring the status of the identified objective. The Company's objectives, as noted on pg. 5, lines 17-23 of Company Witness Cantler's Direct Testimony are features of its capital investment strategy throughout this MYP and support a pathway to a Climate Ready Grid. As such, please see the Company's response provided for AOBA DR 1-2. The Company is committed to supporting solutions to address climate change, enhancing our grid's performance, improving social equity and affordability and looking to enhance our customers' experience.

b. The requested breakdown has not been performed. There are too many direct, indirect and tertiary benefits to certain projects to accurately ascertain and/or categorize which singular Company objective a project supports or does not support.

   However, projects, like the implementation of Advanced Distribution Management System, as referenced Pepco (H)-2 on pg. 174, are indicative of enhancing grid performance, and if granted IIJA funding would also, in turn, support affordability for our customer base through subsidization offered by a federal grant. Additionally, there are components of the Company's IT investments referenced in Pepco (H)-2 that will contribute to making energy more affordable by increasing customer participation in energy assistance and energy efficiency programs. For a full list of every project and the justification for that project work please refer to Pepco (H)-2 in its entirety.

c. The Company does not generally conduct cost-benefit analysis (CBA), though as mentioned previously, does conduct robust alternative analyses. The Company has conducted cost-benefit analysis in a few areas including: evaluating technologies or initiatives that have not previously been proposed, an initiative that has a societal benefit, or when required by the Commission or regulatory body.

   That being stated, and in an effort to be responsive to this request, the Company is currently in the process of compiling relevant information pertinent to CBAs that exist for project work specific to this MYP for a similar request related to AOBA DR 7-25. Once that information has been compiled it will be shared and made available in response.

INTRODUCTION

Potomac Electric Power Company (Pepco) herein presents its 2015 Consolidated Report combining three reporting requirements directed by the District of Columbia Public Service Commission (Commission) in Formal Case Nos. 766 and 991. The three reports comprising the Consolidated Report are identified respectively as the Comprehensive Plan for the Planning, Design, and Operation of the Distribution System within the District of Columbia (Comprehensive Plan), the Productivity Improvement Plan (PIP), and the annual Manhole Event Report. Additionally, a section of References has been included at the end of the report.

The 2015 Consolidated Report maintains the format of the 2014 Consolidated Report. References to previous Commission directives are included in footnotes or the body of the report, as noted throughout. However, the 2015 Consolidated Report has been filed on April 1, 2015, reflecting the Commission's acceptance of Pepco's proposal, as stated in Order No. 17684.[1]

Summary

The following is a brief description of the four parts of this Report:

Part 1: Comprehensive Plan

During Commission hearings on November 5-7, 2001, addressing Formal Case No. 991, the Commission issued directives, followed by Order No. 12293, requiring the Company to produce and submit its first Comprehensive Plan on February 8, 2002. Pepco's filed report presented a compilation of major elements of its underground distribution construction and plans as well as supporting technologies and conversion programs to improve system reliability. Over the years, the Comprehensive Plan has evolved with Commission orders to

[1] *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. RM5-2014-01-E, Order No. 17684 ("Order No. 17684") at P 3 (Oct. 27, 2014).

address current issues. In 2015, the Comprehensive Plan covers similar material to the 2014 Comprehensive Plan.

Part 2: PIP

On November 1, 1982, in Order No. 7668, the Commission adopted final rules regarding the submission of an annual PIP in Formal Case No. 766. These rules are codified in Title 15 of the District of Columbia Municipal Regulations, Chapter 5, Rules 502.1 and 502.2. Because of the divestiture or transfer to an affiliate of all of Pepco's generating stations, most of these rules are no longer applicable to Pepco's operations. Instead, this PIP was compiled pursuant to the latest requirements for Pepco to report on its transmission and distribution system operating performance and measures to improve service reliability.

Part 3: Manhole Event Report

Part 3 of the Consolidated Report is the 2014 Manhole Event Report. On June 6, 2000, the Commission issued Order No. 11716 in Case No. 991 requiring Pepco file an annual Manhole Event Report on the previous year's manhole incidents. Part 3 of the Consolidated Report includes descriptive statistics regarding reportable events, a trend analysis for slotted manhole covers, and a listing of splice data. Appendix 3A contains a listing of 2014 Manhole Events. Appendix 3B includes a discussion of the 2014 Manhole Inspection Program including annual program results. Appendix 3C contains Pepco's update on implementation of its Network Accuracy Procedure.

Part 4: References

Part 4 of the filing contains a compilation of abbreviations, acronyms, and technical terms and diagrams; and a section providing Commission Order references delineating the history of the Consolidated Report requirements.

Attachment A

Finally, Attachment A reflects the REP and Non-REP project budgets and work plans for 2015.

PART 1: 2015 COMPREHENSIVE PLAN

Since Pepco's first Comprehensive Plan was filed in 2002, the document has evolved with Commission orders addressing additional issues. In 2015, the Comprehensive Plan covers similar material to the 2014 Comprehensive Plan.

SECTION 1.1 – ELECTRIC SYSTEM OVERVIEW

Pepco has an extensive transmission and distribution electric system used to deliver energy to its customers. Pepco's transmission lines typically transmit power at 230,000 or 500,000 volts. Subtransmission lines carry the energy at 138,000, 115,000, 69,000 or 34,500 volts. The overhead or underground transmission lines deliver the energy to the load areas. Substations that are supplied by voltage levels ranging between 34,500 and 230,000 volts are generally equipped with circuit breakers, relay schemes and other equipment to isolate faulted or damaged equipment and protect the rest of the electric system.

Distribution circuits radiate from the distribution substations to supply customers. These distribution lines may exit the substation underground and then rise on utility poles to connect to the overhead distribution system. These underground 'getaway' duct banks minimize the overhead circuits in the vicinity of the substation, which may be the origin of a number of distribution feeders. Distribution lines may also deliver energy to customers using circuits completely underground. Distribution feeders are typically 13,200 or 4,160 volts.

Distribution transformers are connected to the feeders to further reduce the voltage in order to supply residential or commercial customers. Pole-type transformers are used on the overhead system, and pad-mounted or submersible transformers are used on the underground system.

Pepco serves both the District of Columbia and Maryland with an integrated system, and components residing in Maryland are important to serving District load and vice-versa. Therefore, the planning process for meeting load growth is the same across both the District and Maryland and any description of the planning process is applicable to both jurisdictions unless otherwise noted.

Pepco's distribution system delivers electricity at regulated rates to about 816,000 customers system-wide in a total service territory of approximately 640 square miles. Pepco owns and maintains approximately 4,200 circuit miles of overhead and underground primary and secondary distribution and transmission lines in the District of Columbia.

Pepco's transmission and distribution (T&D) electric system consists primarily of substations that are remotely monitored and operated from its centralized Control Center. Control Center system operations enable the safe, reliable and efficient operation of the system by performing the following:

- Monitoring and controlling the electric system to provide for the reliable operation of the transmission and distribution and bulk power system;
- Coordinating the safe operation and rapid restoration of facilities during emergency conditions;
- Evaluating transmission system outage requests to provide reliable and safe transmission operations;
- Minimizing power outages and safely resolving trouble reports and emergency calls by the effective dispatch of crews; and
- Maintaining the Outage Management System and coordinating scheduled power outages.

Pepco owns nearly 1,000 miles of transmission lines, including major portions of a 100-mile 500 kV loop that encircles the Washington, D.C. metropolitan area. Pepco is a member of the PJM Interconnection, the Regional Transmission Organization (RTO) responsible for coordinating the movement of wholesale electricity in all or parts of 13 states and the District of Columbia. In addition PJM is responsible for the operation of the transmission system and directs the operation of Pepco's transmission system. Pepco can exchange power with its neighbors through three transmission interconnections with Potomac Edison to the west, two interconnections with Dominion Resources to the south, and seven interconnections with other PJM companies to the north and east.

Pepco's substations are capable of supplying the maximum load during peak periods and are designed to withstand the loss of one supply circuit or station transformer without loss of load.

If capacity problems arise, Pepco's system is designed to allow switching, or transfer of load, to other circuits or substations to relieve a localized problem.

The distribution system across the Pepco service area is managed based on a longstanding planning, engineering and maintenance program that closely monitors system load growth and performance. As growth occurs, work plans are issued in advance of meeting peak load conditions to add new facilities and capacity that will provide service to the existing and new load growth. The Company will continue to expand its existing approach to increase system reliability and ensure compliance with the Electricity Quality of Service Standards (EQSS) requirements.

SECTION 1.2 – SYSTEM PLANNING[2]

The mission of System Planning is to develop a rational and orderly plan for Pepco's existing and future electric system needs that will provide reliable electric service to customers and support load growth in a cost effective manner. In order to accomplish this mission, the North American Electric Reliability Corporation (NERC) / Reliability First Corporation (RFC) Standards and Pepco's Planning Criteria for the Transmission, Subtransmission, and Distribution Systems govern the design of the electric system.

---

[2] The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. The Commission requested that the Company provide a Comprehensive Plan detailing proposed changes to the electric system for the purposes of meeting load growth or maintaining system reliability. On pages 143-144 of the hearing transcript, Pepco's Witness Gausman explained the nature of the Company's existing plans for the distribution and transmission systems:

> *We have plans for each of our substations in D.C., and in each of those plans we address the needs for that location, what the growth forecast is, what type of construction is going to be needed for expansion in the distribution system in each of those locations… Now when you go up to the transmission level or the substation supply level, there you have a plan that is addressing a larger area of the town because you're looking at the whole capacity of the system.*

The Company expanded its responses to the Commission's requests in the first filed Comprehensive Plan. Since that date, the Company's Comprehensive Plans have been expanded based on several Commission directives. The report that follows either expands upon the discussion in the initial hearings requesting the Consolidated Report or responds to subsequent Commission directives as cited below.

The following section of the report addresses system plans based on forecasted load growth.
In Order No. 12804 paragraph 53 B, the Commission stated the following:

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO:*
> *(b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report.*

Pepco continuously analyzes the adequacy of its electric system to meet demand for energy on its system and to plan for future growth. The Company maintains engineering and operating criteria to be used in the design of new and modified portions of the system. To provide for rational and orderly changes to the electric system, Pepco has developed engineering and operating criteria which it applies to the design of new and modified systems. The three major components of system planning criteria are (1) voltage and reactive support, (2) ratings of facilities, and (3) reliability. For example, voltage on a nominal 120 volt system must be maintained between 114 and 126 volts under normal conditions and between 105 and 126 volts under contingency conditions. Ratings of facilities include normal, emergency, and short-term emergency ratings on all facilities including feeders, power transformers, circuit breakers, for both summer and winter periods. In terms of reliability, the data that are reviewed and tracked include historical and forecasted load vs. capacity of the feeders, feeder groups, and substations.

1.2.1 LOAD FORECASTING[3]

Planning for future load growth starts with the development of load growth projections. Short-term, summer-peak forecasts are developed for three years to allow adequate time to complete routine 4 kV and 13 kV construction work. Long range forecasting (four to ten years) is used to develop advance plans for large 4 kV and 13 kV construction projects that require more than two or three years to complete, to develop routine and advance plans for 34.5 kV to 230 kV construction work, and to identify future capital projects in the Construction Budget Forecast process.

Forecasting begins with the examination of the summer historical loads for each feeder and substation on a two year cycle. Further, actual new customer loads from submitted class of service forms and other available development reports, planned changes in feeder configuration and emergency transfers are also analyzed. The individual feeder and feeder

[3] In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, the following topics were discussed, as cited on pages 141-144 of the hearing transcript:

- *Comprehensive long-term planning on the underground system*
- *Pepco's 10-year construction plans*
- *Distribution load growth forecasts by substation*
- *Transmission/substation supply load growth forecasts*

group loads for each year are calculated and adjusted to produce the substation load predictions for each year of the plan.

Customer Growth Projections and Historical Comparisons[4]

Pepco's System Planning group forecasts electric load growth in order to plan for future additions to the electric system. Changes in the number of customers do not necessarily correspond to a similar change in load since neighborhoods containing specific types of customers may be redeveloped into ones containing different types of customers with different load usages. In addition, existing customers may increase their load, which has no effect on the customer count. Both new customer additions and increases in existing customer load are factors used in forecasting load growth. Since forecasting customer growth has little impact on the electric system planning, Pepco focuses on forecasting system load growth.

District of Columbia customer counts for six years (2009-2014) are provided on a substation basis in Table 1.2-A. Substations have been assigned to District of Columbia wards based on their location rather than the area that they serve.

Load Growth Projections and Historical Comparisons

Table 1.2-B provides six years of historical loads, Table 1.2-B-2 provides six years of previously forecasted loads for comparison to the actual historical loads recorded in Table 1.2-B-1, and Table 1.2-C provides Pepco's projections for electric load growth in the District of Columbia for 2015 to 2024. The 32 substations listed in Table 1.2-B represent all the 13 kV distribution substations and the 4 kV substations not supplied by a listed 13 kV substation within the District of Columbia. Pepco tracks and projects load by substation. Substations have been assigned to one of the eight District wards based on the substations' locations rather

---

[4] In Order No. 12735 issued on May 16, 2003, the Commission directed (paragraph 139) the following:
139. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:
(a) Customer growth projections by District of Columbia wards (including historical comparisons);
(b) Load growth projections encompassing commercial and residential development by District of Columbia wards (including historical comparisons);
The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

In Order No. 12804 (paragraph 53) the Commission directed the following:
53. The 2003 PIP is hereby APPROVED, provided that PEPCO:
(a) Provide the projected zonal and projected default (i.e., SOS) load data for the District of Columbia to the PIWG on a quarterly basis as well as in the 2004 and subsequent PIPs;…

than the area that they serve. Because feeders may cross ward boundaries, all feeders emanating from a substation will be assumed to supply load in the ward to which that substation is assigned.

The District has experienced uneven overall load growth from 2009 to 2014, as there are certain neighborhoods that have been growing relatively rapidly. Pepco's planning process examines historical load data on its substations and feeders, then examines prospective new business (PNB) report data to develop a short-term forecast for each feeder and substation. Pepco uses trends developed in the short-term forecasting process combined with information about long-term neighborhood development projects to determine the long-term forecast for each feeder and substation. The trend analysis also takes into consideration energy efficiency activities that customers have supported during the past year and further uses AMI data from recently constructed buildings to refine expected loadings for new buildings. Since energy efficiency activities generally result in small reductions per customer across large portions of the city, no other method can accurately predict where these reductions would occur. Developing energy usage trends will reflect these reductions in aggregate and are included in the decision-making process to determine when and where increased capacity is needed.

Accuracy of Load Forecasts[5]

The comparison of actual measured peak loads in Table 1.2-B-1 versus forecasted loads in Tables 1.2-B-2 and 1.2-B-3 reflect variances that range from 8% in 2011 to 15% in 2014. Pepco bases its historical load analysis and load forecasting on the 90/10 concept – meaning that the peak loading is predicted in such a way there is a 90% chance that a peak could fall short of the prediction and a 10% chance it could exceed the prediction. Accordingly, much of the variance in load can be explained through the fact that the summers of 2010, 2012, 2013, and 2014 were less than 90/10 load years. Year 2011 was considered a 90/10 load year based upon the number of days of extremely hot and humid weather in the District of Columbia and the large number of Pepco feeders and substations experiencing all-time peak loading. The

5 This section is included in response to the Commission directive to Pepco "to provide in its 2015 Annual Consolidated Report the five-year historical data and a discussion of variance and trends in the accuracy of these forecasts," *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 169 (February 27, 2015).

reason for the 8% variance in that year was due to accumulation of error in assumed load going in service over the years between the previous 90/10 peak 2007 and the new 90/10 peak of 2011. In the past, planners used interval billing data for commercial loads to determine the amount of new customer load going into service and an assumed kilo-watts peak demand per unit of residential load. In the future, new load coming in service will be taken from AMI readings which should improve historical analysis accuracy.

A 90/10 peak is established by comparing the system peak load of the year being examined versus the peak loadings of the past ten years along with reviewing the weather occurring during the peak loading. Generally, sustained high temperatures with high humidity over three or more days are needed to generate peaking conditions. Peak loading of a 90/10 peak will be near or above the previously established peak. Once a 90/10 peak load is established, as it was in 2011, the historical loads at each substation are set to the actual measured peak load for that summer and subsequent forecasts are based off of this new baseline load, as can be seen in the reduced forecasts for years 2012 through 2014. The adjusted baseline is the actual measured peak seen by the system.

Pepco's short range forecast is generally determined by the amount of PNB load that is predicted to come on line in the next three years. Most of the load and timing information about PNBs comes from the developers who either apply for service through Pepco's class-of-service process or provide information on their projects through public announcements or disclosures. Often times developers provide aggressive timelines for when their projects will be in service and carrying load. Pepco is cautious about depending on these timelines. Thus planners continuously look at the status of each PNB during the planning process compared with the developer's proposed in-service date to make an estimate of when load will come into service, often spreading load over two or three years to account for a building not being fully-occupied upon completion. This process helps minimize the variance as well as ensure that customers in-service dates are met.

Using peak load for new PNB load coming in service does not account for the diversity in loads that is likely to occur for multiple customers. Further, reductions in load due to conservation measures, both passive and active, are not accounted for in non-90/10 years when load is calculated based on previous peak rather than on measured load. It is not possible to determine the effects of passive conservation in advance of a measured 90/10 peak, therefore effects of conservation are only accounted for once a 90/10 peak is established.

Though Pepco planners spread PNB growth over several years rather than assuming all PNB load is realized during the in service year, the forecasts prepared are appropriately conservative. Some projects will be delayed beyond the timeline of the short term forecast which affects PNB growth in an area for future years as other projects become delayed. This happened in the area around the Washington Nationals baseball stadium where much of the growth stopped from 2009-2012 following the economic downturn. Load did not grow as quickly as predicted during those years in that area leading to forecasts for the Buzzard Point substation being adjusted. However, from the number of developments currently under construction in the area around the baseball stadium, along with ongoing construction activity and measured load increases, Pepco planners are more persuaded that the area has recovered and will be undergoing significant load growth in the near future. Thus, planners will take a more aggressive approach to including PNB growth in the load forecast, again so that adequate infrastructure is in place to meet the customer in-service dates.

While the area around the baseball stadium did see reduced load growth during the years 2009-2012 as a result of the economic downturn, conversely, the NoMa area showed little slowdown in completed projects during that time. Because Pepco had a conservative forecast for that area, a new transformer was added to Northeast Sub. 212 and a new LVAC feeder group was extended in time to meet the load growth. (The variance between predicted and actual peak loading for the Benning NW Spot Network Group in 2012, a non-90/10 year, was 2.5%.)

Pepco's approach is appropriately conservative because the consequences of not building facilities to meet potential area load growth can be high as severe damage due to overloads causes extended outages to customers. Such outages would be difficult for customers, would negatively impact Pepco reliability indices, and are contrary to improving reliability. Therefore, it is critical from a reliability perspective that Pepco prepare its load forecasts assuming a 90/10 season, making baseline adjustments when necessary, and considering what is the largest amount of load growth that could reasonably occur during the forecasting period given the available data.

Discussion of Load Growth Trend Variances Affecting The L Street Substation and Mt. Vernon Square Substation Projects[6]

L Street Substation

In the 2014 Consolidated Report, the L Street Sub project called for double-legging the four 34 kV supply feeders from Buzzard Point to the L Street substation. This project was first reported in the 2012 Consolidated Report with a June 2016 in service date. Pepco's plans were based on the predicted need to relieve a predicted overload on Georgetown Sub. 12. In the 2013 ACR, the projected in-service date of this project changed to June 2019 based on revised load predictions at the Georgetown substation. In the 2014 ACR, the in-service date remained the same while the project was being reevaluated. No change was made to the project in service date until that evaluation was completed.

As discussed in Section 1.2.3 of this report, the current projection for the in service date is revised to June 2024, based on the need to replace aging infrastructure by that time. In addition, the scope of the work required was changed, and Pepco now expects to extend three new 34 kV feeders from Takoma substation rather than double-legging the feeders from Buzzard Point substation. The revised configuration will allow the aging 34 kV and 13 kV substations at Buzzard Point to be retired.

Changes in load forecasts as well as assessments of field equipment led to changes to both the in service date and scope of this project. The adjustment of in service dates and reevaluation of the overall project is an example of how Pepco's forecasting and budgeting process revisits projects annually to ensure that the projected timeframes match the load requirements.

---

[6] This section includes clarifications in response to the Commission directive to Pepco to:

> [C]larify whether project descriptions, cost estimates, projected in-service dates and related data for the L Street and Mt. Vernon Square substation projects are final or subject to change. In its clarification, Pepco is to provide a showing that these projects are needed to ensure reliable electric distribution service, including a description of any aging infrastructure to be replaced and the load projections upon which additional capacity requirements are predicated. In describing these load projections, Pepco is to indicate how AMI data and/or Smart Meter data have been incorporated into the projections.

In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 167 (February 27, 2015).

Mt. Vernon Square Substation

The load predictions for the Mt. Vernon Square substation project have been relatively consistent since the project was introduced in the 2013 CR.

Facility: Northeast Sub. 212 Southwest LVAC Group

Summer Rating = 50.0 MVA

	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated
2015 ACR	38.7	40.3	43.5	46.6	49.2	52.0	54.5	56.6
2014 ACR	41.0	42.1	43.6	46.8	48.6	51.2	53.2	55.1
2013 ACR	41.6	44.3	46.5	48.8	50.9	53.1	55.2	57.5

<u>Forecasted Loads for Northeast Sub. 212 SW LVAC Group from Past Three ACRs</u>

The amount of development currently occurring in the Mt. Vernon Triangle area, including Capitol Crossing, is evidence that the existing load forecast is in line with actual and developing load. As previously stated, the ten year forecast is conducted each year and a reduction in the forecast could lead to a deferral of the Mt. Vernon substation if warranted.

Incorporation of Field Information into the Planning Process[7]

Pepco's planning process incorporates equipment condition assessments (ECA) and other field information into its short-term and long-range plans, when applicable. The planning group creates long-range plans to upgrade or replace utility infrastructure evaluated to be approaching end-of-life.

The planning group is an active participant in ECA meetings and is the sponsor of substation transformer and switchgear replacement projects. The planning group participates in decision making regarding actions to take when equipment is evaluated to be near end-of-life, including whether to replace the equipment in kind or through a new capital project. The decision

[7] Order No. 16975 states the following at paragraphs 89 and 116:

89. Decision: The Commission believes that OPC's recommendation has merit. However, we understand that equipment condition assessments may be included within the distribution system planning process, as shown in the description of the Pepco Planning Process provided by OPC at "Existing System Analysis." We direct Pepco to explain in the 2013 Consolidated Report the extent to which field information is considered within "Existing System Analysis."

116. Pepco is DIRECTED to provide field information consistent with paragraph 89 herein;

depends upon how close to failure a piece of equipment is evaluated to be, what other load-driven or reliability-driven capital projects are in the area, and the age and condition of other equipment in the substation.

An example of a condition assessment being incorporated into the planning process is the proposed 34 kV feeder extension project to L Street Substation 21 in order to increase capacity at the station. Originally, the project scope was to double-leg existing 34 kV feeders from Buzzard Point Sta. B. However, assessments of Buzzard Point facility determined that it is in deteriorating condition, and it would not be economically feasible to rebuild the 34 kV substation there for the sole purpose of supplying L Street Substation 21. Therefore, the decision was made to extend 34 kV feeders from Takoma Substation 27.

Notes: All substations supply 13.8kV of primary power unless otherwise noted.
Totals shown are the sum of undiversified peak loads and are not meant to be used as official Pepco system peak loads.
Totals shown for first two years include planned transfers, the last eight years do not show planned transfers.

Table 1.2-C

On a system basis, Pepco's control area loads over the ten-year period between 2005 and 2014 are provided below in Figure 1.2-A.

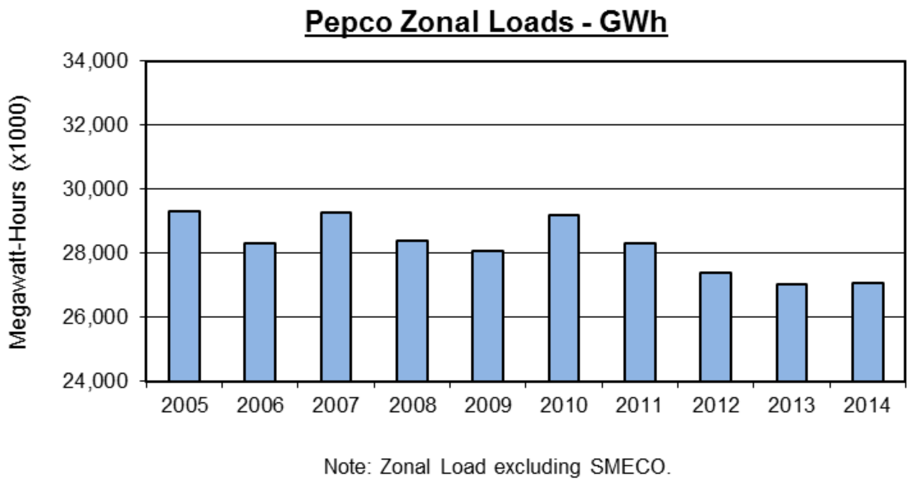

Figure 1.2-A

Pepco's projected monthly and annual zonal loads for 2015 are provided in Table 1.2-D. Pepco's zonal loads are for the Pepco distribution system (Maryland and District of Columbia), excluding the Southern Maryland Electric Cooperative (SMECO) and include demands for Pepco distribution customers.

*Excludes SMECO load													

Table 1.2-D Pepco Zonal Load

1.2.2 POWER FACTORS AND ENERGY LOSSES[8]

Power Factors

The power factor provides one measure of how efficiently Pepco's electric system is being used. Substation load has two components: real power (kilowatts) and reactive power (kilovars). Real power is the power which serves the customers' end-use electrical devices. Reactive power does not serve customer requirements but decreases the substation's ability to deliver real power and increases system losses. This reduced ability to deliver real power is based on a substation's power delivery limitations. The power delivered is a combination of reactive and real power, so the greater the reactive power, the lower the real power that can be delivered. As the system power factor approaches unity, real power delivered is greater and system losses due to reactive power are reduced. By making appropriate use of capacitors, the reactive power flow on the electric system can be reduced such that it approaches zero. (When the reactive power flow is zero, the power factor is unity (*i.e.*, 1.0).) A unity power factor would be ideal and would result in the maximum usable power being delivered to the customers. However, a unity power factor is not technically or economically practical to maintain because of changing loads and system conditions.

[8] In Order No. 10133, the Commission directed Pepco to include performance factors relating to the transmission and distribution (T&D) system in future PIPs.

> *"PEPCO…was directed to…provide in future PIP reports forecasts of plant performance factors which are based on analyses of both the projected performance and the prior year's actual performance"(page 10, Section B).*
>
> *"…the Commission finds it entirely appropriate to include performance measures for PEPCO's transmission and distribution in the mix of issues examined by the PIWG and reported in the PIP"(page 12, third paragraph).*

By way of compliance with the above requirements, in the September 1993 PIWG Meeting, Pepco proposed reporting performance data on its 13 kV distribution substation power factors.

Pepco plans for a 98% (.98) power factor or higher on its 4 kV and 13 kV distribution substations at the summer peak. Table 1.2-E below provides the percent of all Pepco's 4 kV and 13 kV distribution substations that had power factors ≥ 98% at the summer peak hour for the years 2007 - 2014. In 2014, 97% of the 4 kV and 13 kV substations in the District of Columbia had a power factor of ≥ 0.98 at the summer peak hour.

% of Pepco Substations with Power Factors
Greater than 98% on Peak Summer Days
(System-wide)

	2007	2008	2009	2010	2011	2012	2013	2014
% of 4 kV and 13 kV Substations with Power Factor ≥ 0.98	92%	93%	94%	96%	95%	96%	97%	97%
Total Number of 4 kV and 13 kV Distribution Substations (Pepco system-wide)	116	117	116	116	116	116	115	115

Table 1.2-E: Power Factor

Annual System Energy Losses[9]

Table 1.2-F shows a ten-year comparison of annual system energy losses for PJM and adjacent utilities. Data for 2004 through 2013 were obtained from the Federal Energy Regulatory Commission (FERC) web site. All data are from FERC Form 1. A comparison of annual system energy losses over the past ten years is provided for PJM utilities and utilities adjacent to the Pepco service territory. Pepco's system energy losses for 2013 are 2.71% or approximately52% better than the group average of 5.62%.

% Annual System Energy Losses:

$$\%\ \text{Annual System Energy Losses} = \left(\frac{\text{Total Energy Losses (FERC Form 1, Line 27, page 401a)}}{\text{Total Energy (FERC Form 1, Line 28, page 401a)}} \right) \text{X } 100$$

Industry Comparison

1.2.3 SUBSTATION ADDITIONS AND ENHANCEMENTS[10] [11]

The discussion below updates the information provided in the 2014 Consolidated Report. All planning data is based on current information, and may be revised as the Company receives new information affecting the costs, timing, or necessity of projects.

[10] In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (page 266 of the hearing transcript):

> *But what we were talking about here yesterday was that the comprehensive plan would include… any rebuilt substations you might have; any new substations you might have…*

[11] Order No. 16975 states the following at paragraphs 50 and 101:

> *50. Decision: …Consequently, we require Pepco to include a report on substation additions and enhancements in future Consolidated Reports. In addition to the information provided in the 2012 Consolidated Report, the Commission requires that Pepco provide details concerning the justification for these projects, including, as applicable, load growth projections and equipment age and condition in future Consolidated Reports.*
>
> *101. Pepco is DIRECTED to provide a report on substation additions and enhancements consistent with paragraph 50 herein;*

Table 1.2-G shows Pepco's planned substation additions and enhancements for the District of Columbia with their anticipated in service dates.

#	Project Cost	Project Description	Projected Date Required	Areas Served
1	**$21.6 million**	**Florida Ave Sub. –** Install 4th transformer to relieve predicted substation overload.	Completed	Shaw, Mt. Vernon Square/Convention Center
2	**$21.1 million**	**Northeast Sub. –** Install 4th transformer to relieve predicted substation overload.	June 2016	NoMa, Mt. Vernon Square/Convention Center
3	**$16.3 million**	**Alabama Ave Sub**. – Install 2-100 MVAR reactors to relieve predicted substation overload.	December 2015	St. Elizabeth's, Barry Farm, Buena Vista, Douglass
4	**$150.0 million**	**Waterfront Sub. –** Build new substation to relieve predicted substation overload.	June 2017	Southwest, Navy Yard
5	**$106.7 million**	**Harrison Sub. (Formerly Northwest Sub.) –** Upgrade substation to replace aging infrastructure.	December 2017	Friendship Heights, Chevy Chase
6	**$67.5 million**	**L Street Sub. –**Extend new 34 kV supplies to increase capacity.	June 2024	Downtown, Dupont Circle
7	**$298.4 million**	**Mt. Vernon Square Sub. –** Build new substation to relieve predicted network overloads.	June 2020	NoMa, Mt. Vernon Triangle, Shaw
8	**$109.3 million**	**Harvard Sub. –** Upgrade Harvard as a new 230/13 kV substation to retire existing Harvard and Champlain substations.	December 2021	Columbia Heights, Adams Morgan

Table 1.2-G: Substation Additions and Enhancements

Justification of Substation Additions and Enhancements

The capacity improvements to the Florida Avenue and Northeast substations are to serve new load in the Mt. Vernon Triangle/Convention Center and NoMa areas. The capacity improvement to the Alabama Avenue Sub. is needed to serve new load in the St. Elizabeth's area. The new Waterfront Sub. is being proposed to serve load in the Navy Yard, M Street and

Buzzard Point areas and is needed to replace aging infrastructure at the Buzzard Point Substation and retire aging substations at G Street and Navy Yard. The new Harrison Sub. upgrade is being proposed to replace aging infrastructure and in order to meet area load growth. The capacity improvements to L Street Sub. are recommended to retire aging infrastructure and to serve new load in the West End and Georgetown areas. The new substation at Mt. Vernon Square is needed to provide capacity to the redeveloping Mt. Vernon Triangle and Shaw areas. The capacity improvements at Harvard Sub. are needed to replace aging infrastructure at Harvard Sub. and Champlain Sub., and to create capacity to serve the growing Columbia Heights area.

1. Florida Avenue Sub. – Install 4th Transformer to relieve predicted substation overload (2014 Load Relief Project)

Overview: This project consists of installing a new 69kV/13kV substation transformer at Florida Avenue Sub. 10 and extending a 69 kV supply feeder from New Jersey Avenue Sub. 161. This also requires substation terminal work at New Jersey Avenue Sub. 161. When this work is completed, the total firm capacity at Florida Avenue Sub. 10 will increase from 144 MVA to approximately 210 MVA. This capacity will immediately facilitate a transfer of approximately 33 MVA of load from 12th and Irving Sub. 133 by extending a new high voltage customer feeder group.

Load Growth Projections:

Facility: 12th & Irving Sub. 133

2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
126.6	133.3	137.5	139.4	140.5	142.5	143.9	145.7	147.2	148.5	149.8

Current Status: This project was completed in June 2014.

Total Planned Capital Investment (Includes Administrative & General (A & G)): $21,639,000

2. Northeast Sub. – Install 4th Transformer to relieve predicted substation overload (2016 Load Relief Project)

Overview: Install a new 69/13 kV transformer at Northeast Sub. 212. Extend a new 69 kV feeder from Benning Sub. 7 in order to supply the new transformer. This new transformer will increase the firm capacity at Northeast Sub. 212 enabling the extension of a new Low Voltage Alternating Current (LVAC) network group to the Penn Quarter area in order to relieve a predicted overload on Tenth Street Sub. 52.

Load Growth Projections:

Facility: Tenth Street Sub. 52

Summer — Summer Rating = 205.0 MVA

2014 History	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated
195.6	200.1	209.6	210.8	214.3	217.4	220.3	222.9	225.6	228.4	232.0

Facility: Florida Avenue Sub. 10 South LVAC Network Group

Summer — Summer Rating = 50.0 MVA

2014 History	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated
35.7	41.8	50.2	50.9	51.9	53.0	53.8	54.9	55.4	56.6	57.4

Magnitude of Load: This project will increase the firm capacity at Northeast Sub. 212 from 144 MVA to approximately 210 MVA. Approximately 40 MVA will be transferred from Tenth Street Sub. 52 to Northeast Sub. 212. Also, approximately 15 MVA of load will be transferred from Florida Avenue Sub. 10 to Tenth Street Sub. 52.

Identified Need: Project is needed to relieve a predicted firm capacity overload at Tenth Street Sub. 52 and a predicted overload on the Florida Avenue Sub. 10 South LVAC Network Group. Without this additional supply and transformer, the new Mt. Vernon Sub. would have to be advanced to supply the added capacity required. This addition will complete the expansion of Northeast Sub. and bring the station to its full capacity.

Justification: The load at Tenth Street Sub. 52 is predicted to exceed its summer firm capacity by 3% in 2016. If the Tenth Street load were transferred to Northeast Sub. 212 without the transformer addition, an 8% firm capacity overload is predicted. The Florida Avenue Sub. 10

South Network Group is predicted to be at 100% firm capacity but will be overloaded under certain contingencies in 2016.

Current Status: In construction.

Total Planned Capital Investment (Includes A & G): $21,107,000

3. Alabama Ave Sub. – Install 2-100 MVAR Reactors to relieve predicted substation overload
(Dec. 2015 Load Relief Project)

Overview: This project consists of installing two new 100 MVA shunt reactors on 230 kV Feeders 23088 and 23089 at Alabama Avenue Sub. 136. These reactors will relieve the operating restriction that exists if either Feeder 23088 or 23089 are out of service and a second 230 kV feeder needs to also be removed from service, thereby limiting the firm capacity at Sub. 136. The reactors will allow any one 230 kV feeder to be out of service without the need for taking a second one out. This project also includes the addition of 18.0 MVAR of bus capacitors which will maintain substation power factor as the load increases.

Load Growth Projections:

Facility: Alabama Avenue Sub. 136										
Summer	Summer Rating = 124.0 MVA									
2014 History	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated
94.5	120.0	150.2	152.1	154.1	155.6	157.0	158.2	159.4	160.8	162.9

Magnitude of Load: This project will increase the firm capacity at Alabama Avenue Sub. 136 from 124 MVA to 165 MVA, facilitating the transfer of load from Anacostia Sub. 8 4 kV and 13 kV substations and enable the ultimate retirement of Sub. 8.

Identified Need: Project is needed to relieve a predicted firm capacity overload at Alabama Avenue Sub. 136.

Justification: The load at Alabama Avenue Sub. 136 is predicted to exceed its summer firm capacity by 21% in 2016 after the planned transfers of load from Anacostia Sub. 8 are completed.

Total Planned Capital Investment (Includes A & G): $16,295,000

Current Status: In design.

In-service Date: December 2015

4. Construct New Waterfront Sub. 223

(2017 Load Relief Project)

Overview: This project consists of constructing a new 230/138/13 kV substation with an ultimate capacity of 350 MVA. It will initially have three 230/138/13 kV transformers for 144 MVA of capacity. This work will bring distribution capacity to the rapidly growing Southeast and Southwest District of Columbia areas. The new Waterfront Sub. 223 will allow for the transfer of load from and ultimate retirement of Buzzard Point Sta. B 13 kV bus, Navy Yard Sub. 33 and G Street 4 kV Sub. 28.

Load Growth Projections:

Facility: Buzzard Point Sta. B East LVAC Network Group

Summer Rating = 39.0 MVA

2014 History	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated
34.8	38.7	39.7	42.2	43.4	44.5	45.5	46.3	47.2	48.5	49.5

Facility: G Street Sub. 28 Forecasted Loadings

Summer Rating = 18.0 MVA

2014 Historical	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated
14.3	14.5	14.8	14.9	15.0	15.1	15.2	15.3	15.4	15.5	15.6

Facility: Navy Yard Sub. 33 Forecasted Loadings

Summer Rating = 21.0 MVA

2014 Historical	2015 Anticipated	2016 Anticipated	2017 Anticipated	2018 Anticipated	2019 Anticipated	2020 Anticipated	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated
18.1	18.5	18.7	18.8	18.9	19.0	19.1	19.2	19.3	19.4	19.5

Magnitude of Load: Initially, approximately 83 MVA of load will be transferred from Buzzard Point Sta. B by June 2017. The 4 kV conversion (approximately 14 MVA) from G Street Sub. 28 to Waterfront Sub. 228 are scheduled to begin in 2017 and to continue through 2021. All load (approximately 20 MVA) from the Navy Yard Sub. 33 is scheduled to be transferred to Waterfront Sub. 228 by 2019.

Identified Need: This project is needed to relieve a predicted LVAC network feeder group overload and improve reliability by replacing aging infrastructure.

Justification: The Buzzard Point Area is expected to continue to experience intensive development. The Buzzard Point Sta. B East LVAC Network Group is predicted exceed its firm capacity in 2017 by 8%. There are no nearby substations with available feeder positions for extending a new LVAC network feeder group to relieve the Buzzard Point Sta. B East LVAC Network Group.

Buzzard Point Sta. B was originally constructed in the 1930's as a generating station and was modified over time to include transmission and distribution substations. The station has been renovated over the years, most recently with a life-extension project performed in the early 1990's, which replaced circuit breakers and relays but did little to improve the physical substation building. The substation bus configuration is considered non-standard, with a double-bus configuration that reduces feeder group redundancy. High fault current availability required installation of in-line reactors between Buzzard Point's 13 kV busses, creating operational issues on the Southeast LVAC Network Group. This requires extra maintenance and could reduce network reliability and is the only group supplied by all six of Buzzard Point Sta. B's busses. Three of Buzzard Point Sta. B's 138/13 kV transformers were installed in 1964 while the other three were installed in 1979, 1980, and 2008, respectively.

Navy Yard Sub. 33 was put in service in 1957 as a temporary substation to supply the Navy Yard. It has been maintained as a permanent substation, but the equipment is aging. The load on the substation is approaching the firm capacity of 21 MVA due to load additions within the Navy Yard. In order to support this growth, new 13 kV supplies to the Navy Yard and O St. Pumping Station will be extended from the future Waterfront Sub. 223.

G Street Sub. 28 and its 4 kV system were constructed in the 1950's. The area supplied by G Street Sub. 28 is predicted to experience only moderate new development and renovations; however, this system was identified for 4 kV conversion in Pepco's 4 kV Long Range Plan. The G Street Sub. 28 – 4 kV system is planned to be converted to 13 kV distribution in coordination with the construction of the new Waterfront Sub. New 13 kV feeders are to be extended from the proposed Waterfront Sub. 223.

<u>Total Planned Capital Investment (Includes A & G):</u> $150,000,000

<u>Current Status:</u> In design.

<u>In-service Date:</u> June 2017

<u>Alternative</u>: When the substation was initially proposed, a study was conducted comparing the overall cost of the substation if it were located near the existing Buzzard Point Station on Pepco-owned land or at a site purchased somewhere near the Navy Yard closer to where much of the new development was occurring at that time. The analysis showed that locating the substation near Buzzard Point on Pepco-owned land required the same amount of revenue as locating the substation near the Navy Yard, however, Pepco assessed the risk of locating the substation near Buzzard Point on Pepco owned property to be less than obtaining a two acre property near the Navy Yard and building a substation there. This is due to the limited land available and the difficulty of building a new substation in the area of the Navy Yard.

5. Upgrade Harrison Sub. 38 (formerly Construct New Northwest Sub. 228)
(2017 Aging Infrastructure Project)

The upgraded Harrison Sub. 38 will be a 138 kV / 13 kV substation with an ultimate capacity of 150 MVA. All 13 kV load currently supplied from Harrison Sub. 38 will be temporarily supplied from temporary equipment to be assembled on the site next to Harrison Sub. 38. This will allow the existing substation to be de-energized so that the station can be upgraded on the site of the existing station. Once construction is finished, all circuits will be transferred from the temporary equipment and the temporary equipment will be removed from the property.

Load Growth Projections:

Facility: Harrison Sub. 38										
Summer	Summer Rating = 56.0 MVA									
2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
51.4	48.4	49.2	50.1	51.0	51.7	52.3	52.9	53.5	54.3	55.1

Note: Loads shown include the net effects of converting and transferring the 4 kV load off of Harrison Sub. 38 to other area substations.

Magnitude of Load: Approximately 50 MVA of load will initially be served from the upgraded Harrison Sub. 38 in 2017. Approximately 70% of the load is in the District of Columbia. Additional load will be transferred from neighboring substations in the following years in order to provide capacity for future growth in those areas.

Identified Need: Project is needed to improve reliability by meeting load growth and replacing aging infrastructure.

Justification: The main building at Harrison Sub. 38 was constructed in 1940 and has had various additions over time. Harrison Sub. 38 – 13 kV substation is anticipated to exceed its firm capacity in the summer of 2015, prior to planned conversions and transfers from the Harrison Sub. 38 – 4 kV Substation currently in progress. The transformers are 47 to 60 years old. Transformer 1 has been assessed as impaired and will need eventual replacement. The switchgear is a double bus configuration and in need of replacement based on its assessed condition. Some of the switches are 52 years old with only a 500 MVA rating. Reactors are in place to help with duty. This substation is already "landlocked", meaning that there is only access from the front or from a 12 foot driveway. Given that there is no additional space for new equipment, there is no realistic way that the existing equipment inside Harrison Sub. 38 can be upgraded without first removing it.

The existing 4 kV substations at Harrison Sub. 38 are also in need of replacement. Transformer 6 has been assessed as impaired and needs eventual replacement. Pepco plans to convert and re-route existing 4 kV feeders in order to retire the 34/4 kV and 13/4 kV substations at Harrison Sub. 38 and not build a 4 kV substation on the Harrison substation property.

Total Planned Capital Investment (Includes A & G): $106,691,000

In-service Date: December 2017

Current Status: In planning stages with preliminary engineering started to support development of conceptual design and permitting. Pepco acquired a parcel of land on Wisconsin Avenue next to the existing Harrison Sub. that will be used for staging temporary equipment to allow the upgrade of Harrison Sub. Construction is planned to start in the third quarter 2015.

Alternative: An alternative to upgrading the Harrison Sub. 38 would be to extend 17 feeders from Little Falls Sub. 77 and transfer all load from Harrison Sub. 38 to that substation.

The total cost of completing this alternative is also estimated to be approximately $107 million and would leave Little Falls Sub. 77 without any spare substation bus feeder positions for future use. Also, it is predicted that Little Falls Sub. 77 will exceed its firm capacity in 2021 if this alternative work is completed, requiring the construction of a new substation at that time.

Economic analysis shows that upgrading Harrison Sub. 38 saves approximately $83 million in cumulative present worth of annual revenue requirements in comparison to the alternative plan to extend 17 new 13.8 kV distribution feeders from Little Falls Sub. 77.

6. **L Street Sub. –** Extend New Feeders from Takoma Sub. 27
(2024 Aging Infrastructure Project)

Overview: Extend three new 34 kV feeders from Takoma Sub. 27 to L Street Sub. 21. These feeders would replace the existing four 34 kV feeders which were installed in 1940 from Buzzard Point Sta. B.

Completion of this project (along with other projects to retire 34 kV supplies to Anacostia Sub. 8, Navy Yard Sub. 33 and upgrading Harvard Sub. 13 as a 230/13 kV substation) will enable the retirement of the 34 kV substation at Buzzard Point. This plan would eliminate the need to rebuild that facility due to its age and condition.

This project would upgrade capacity at L Street Sub. 21 from 55.5 MVA to ultimately 90 MVA.

Pepco is currently investigating further alternatives for re-supplying L Street Sub. 21.

Load Growth Projections:

Facility: L Street Sub. 21										
Summer	Summer Rating = 55.5 MVA									
2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
38.5	40.6	41.8	42.4	43.1	43.7	44.2	44.7	45.2	45.8	46.5

Facility: Georgetown Sub. 12										
Summer	Summer Rating = 134.0 MVA									
2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
122.1	124.0	125.1	125.7	126.8	127.7	128.6	129.7	130.6	131.7	132.8

Magnitude of Load: No overloads are currently anticipated in the area of L Street Sub. 21 for the next ten years. However, Georgetown Sub. 12 is predicted to be at 99% of its firm capacity in 2024 and the increased capacity at L Street Sub. 21 would facilitate future load transfers from Georgetown Sub. 12.

Identified Need: This project is needed to enable the retirement of the existing 34 kV feeders that were installed around 1940. The project will also increase capacity at L Street Sub. 21, which will enable load to be transferred from substations and network feeder groups, approaching capacity limits in the future.

Justification: Completion of the L Street substation resupply project, along with upgrading Harvard Sub. 13 and retiring Anacostia Sub. 8 and Navy Yard Sub. 33, will allow the retirement of the 34 kV Buzzard Point Sub.

Total Planned Capital Investment (Includes A & G): $67,510,000

In-service Date: June 2024

Current Status: In the early planning stages.

7. Construct New Mt. Vernon Square Area Substation
(2020 Load Relief Project)

Overview: This project consists of constructing a new 13 kV substation with an ultimate capacity of 210 MVA. This substation will provide capacity to the rapidly redeveloping area in and around the Mt. Vernon Triangle. This project will also extend the 230 kV feeders using solid dielectric underground cable from Takoma Sub. 27.

Load Growth Projections:

Facility: Northeast Sub. 212 Southwest LVAC Group

Summer — Summer Rating = 50.0 MVA

2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
34.8	38.7	40.3	43.5	46.6	49.2	52.0	54.5	56.6	60.0	62.8

Facility: Northeast Sub. 212

Summer — Summer Rating = 210.0 MVA

2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
92.6	109.6	155.2	159.7	164.2	168.4	172.5	176.2	180.0	184.4	188.7

Facility: Harvard Sub. 13

Summer — Summer Rating = 46.5 MVA

2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
48.3	39.9	38.1	38.9	39.6	40.2	40.7	41.1	41.7	42.3	42.9

Facility: Tenth Street Sub. 52 (after recommended transfer to Northeast Sub. 212 in 2016)

Summer — Summer Rating = 205.0 MVA

2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
195.6	200.1	186.2	187.4	190.9	194.0	196.9	199.5	202.2	205.0	208.6

Magnitude of Load: Initially, approximately 30 MVA of load would be transferred from the Northeast Sub. 212 Southwest LVAC Network Group in 2020.

Justification: Approximately 140 MVA of long-term growth is identified to come into service in the Mt. Vernon Triangle and NoMa neighborhoods over the next 10 years, eventually surpassing the capacity of Northeast Sub. 212, which was built in 2007. The new Mt. Vernon Square Area Sub. will also provide relief to 10th Street Sub. 52 (built in 1974), which has had a peak loading of 90% of capacity or greater every year since 2005. In addition, the Northeast Sub. 212 Southwest LVAC Network Group is expected to exceed its firm capacity in 2020 by approximately 4%, necessitating construction by that year. Due to space limitations in the streets around the Northeast substation, no new feeder groups can be extended to relieve this overload.

Total Planned Capital Investment (Includes A & G): $298,398,000

Current Status: In planning stages.

In-service Date: June 2020.

Alternative: Multiple sites were evaluated for locating the proposed Mt. Vernon Square Sub. A final selection will be made in 2015.

8. Upgrade Harvard Sub. 13

(2021 Aging Infrastructure Project)

Overview: This project consists of removing the current 34 kV/13 kV substation at Harvard Sub. 13 and upgrading to a new 230 kV / 13 kV substation with an ultimate capacity of 210 MVA. It will initially have three 230 kV/13 kV transformers for 144 MVA of capacity. The upgraded Harvard Sub. 13 will serve all 13 kV load served by the existing Harvard Sub. 13 and will provide capacity to enable the transfer of all load from Champlain Sub. 25, which allows the retirement of that facility. The upgraded Harvard Sub. 13 will also provide capacity for future load growth in the Columbia Heights and Adams Morgan areas.

Load Growth Projections:

Facility: Harvard Sub. 13										
Summer	Summer Rating = 46.5 MVA									
2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
History	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated	Anticipated
48.3	39.9	38.1	38.9	39.6	40.2	40.7	41.1	41.7	42.3	42.9

Magnitude of Load: Approximately 41 MVA of load will be served from upgraded Harvard Sub. 13. While the existing Harvard Sub. 13 is being upgraded, all load currently served by Harvard Sub. 13 will be transferred to temporary equipment that will be staged on the adjacent property. Soon after the upgraded Harvard Sub. 13 is put into service, all load (approximately 60 MVA) will be transferred from Champlain Sub. 25, enabling its retirement.

Identified Need: This project is needed to retire aging infrastructure including Harvard Sub. 13 13 kV substation constructed in 1907, the 34 kV supplies to Harvard Sub. 13 from Buzzard Point, constructed around 1960, and Champlain Sub. 25 13 kV substation, constructed around 1954. This upgraded substation will also supply capacity to the growing Columbia Heights area as well as Adams Morgan.

Justification: Both the Harvard and Champlain substations were constructed with concrete cubicles making them difficult to maintain as they age and potentially lead to an extended outage if there is a significant failure at either substation. In addition, completion of this project along with the project to resupply L Street Sub. 21 and the retirements of Anacostia Sub. 8 and Navy Yard Sub. 33 will enable the retirement of Buzzard Point Sta. B 13/34 kV substation. The upgraded Harvard substation will provide capacity to accommodate projected load growth in the Columbia Heights area.

Total Planned Capital Investment (Includes A & G): Budget has not been fully developed – Early estimate based upon similar substation projects is $109,300,000.

Current Status: In the early planning stages.

In-service Date: June 2021

Alternative: An alternative would be to maintain the Harvard and Champlain substations, replacing the switchgear in each substation. This was not considered a viable option as the switchgear would have to be demolished rather than removed because it is concrete encased. In addition, if this station is maintained, the 34 kV transformers at Harvard and Buzzard Point as well as the 34 kV supply feeders would have to be replaced. Even with these replacements, there would not be any increased capacity for future load growth.

1.2.4 DISTRIBUTION PROJECTS[12] [13]

Overhead and Underground Distribution Projects[14]

Pepco's overhead and underground distribution project budgets over the past six years are provided in Table 1.2-H.

Pepco DC 2009 - 2014 Capital Budgets (Dollars in Millions)						
Distribution Construction	2009	2010	2011	2012	2013	2014
Customer Driven	$41.5	$46.1	$44.9	$34.4	$47.0	$53.0
Reliability	$48.5	$58.5	$84.2	$110.3	$138.0	$133.7
Load	$19.2	$6.2	$37.0	$26.9	$36.4	$84.8
TOTAL	$109.2	$110.8	$166.1	$171.6	$221.4	$271.6

Table 1.2-H: Historical Routine Overhead and Underground Distribution Projects

[12] In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (pages 266-267 of the hearing transcript):

But what we were talking about here yesterday was that the comprehensive plan would include… anything that you might envision to account for distribution load growth…

[13] Order No. 16975 states the following at paragraphs 51, 52 and 102:

51. *Staff Recommendation #7: Continue to provide annual updates of on-going and planned OH and UG distribution projects driven by customer, reliability, and load considerations in future Consolidated Reports. Include budget as well as actual spending for each of the three categories and explanation of significant differences in actual versus budgeted amounts…*
85. *Decision: The Commission adopts recommendation #7, noting that Section 1.2.4 of the Consolidated Report does not contain a comparison of actual vs. budgeted spending, nor does it include an explanation of any variances. Pepco is therefore directed to include this information in future Consolidated Reports.*
102. *Pepco is DIRECTED to continue providing updates of on-going and planned overhead and underground distribution projects consistent with paragraph 52 herein;*

[14] In Order No. 12735 issued on May 16, 2003, the Commission stated the following at paragraphs 74 and 135:

74. *During the November 2001 hearings the Commission requested that PEPCO submit a comprehensive plan to include a current assessment of, and future plans for, its underground distribution and network facilities.179 The Commission requested the plan as a tool to evaluate PEPCO's planning methodology and to assess PEPCO's ability to anticipate and respond to changing conditions in its underground distribution system…*
135. *PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:*
    (c) *Listing of underground distribution projects, such as the Adams-Morgan neighborhood project (including budgets, time schedules, and expected benefits) by secondary vs. primary system by District of Columbia wards affected, but not specific locations;*

    The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Pepco's overhead and underground distribution project variances for 2014 are provided in Table 1.2-I.

Pepco DC 2014 Capital Budget Variances (Dollars in Millions)			
Distribution Construction	**2014 Budget**	**2014 Actual**	**Variance**
Customer Driven	$53.0	$57.3	$4.3
Reliability	$133.7	$111.7	($22.0)
Load	$84.8	$27.8	($57.0)
TOTAL	$271.5	$196.8	($74.7)

<u>Table 1.2-I: 2014 Routine Overhead and Underground Distribution Project Variances</u>

Pepco significantly increased its construction budget from 2011 through 2013 to fund the Reliability Enhancement Plan (REP). Pepco's actual spending has also significantly increased in response to the extensive REP effort and to fund feeder and substation load relief work required to accommodate the load growth being experienced in some sections of the city. Pepco's 2014 actual spending on Load was lower than budgeted primarily due to the budget item to purchase land for the proposed Mt. Vernon substation not being completed in 2014. Pepco's 2014 spending on Reliability was lower than budgeted due to the amount of work on seven feeders being carried over into 2015, and the average cost of work per feeder decreasing.

Pepco's overhead and underground distribution project budgets for the next five years are provided in Table 1.2-J. In developing forecasts, system planners review each component of the existing electric system, along with requirements for new service hook-ups, to develop the costs and schedules for changes to the electric system. Results are then proposed as candidates for inclusion in the construction budget process, which takes place during the second half of each year. The construction budget process culminates with the approval of the following year's budget and the selection of projects to be included in the Five-Year Forecast of electric system additions. Projects may be added or deleted from the Five-Year Forecast from year to year as required. The summary Five-Year Forecast for overhead and underground distribution projects, which identifies types of projects and their respective cash flows for the years 2015 through 2019, is provided as Table 1.2-J.

Pepco DC 2015 - 2019 Capital Budget & Forecast (Dollars in Millions)					
Distribution Construction	**Budget**	**Forecast**			
	2015	**2016**	**2017**	**2018**	**2019**
Customer Driven	$55.4	$64.0	$64.8	$65.8	$58.1
Reliability	$127.5	$108.2	$110.9	$144.2	$172.9
Load	$51.8	$51.9	$24.0	$16.4	$37.0
TOTAL	$234.7	$224.2	$199.6	$226.4	$268.0

Note: Pepco only prepares a 5-year forecast; Prospective work for the DC PLUG initiative has not been included in this five-year plan.

<u>Table 1.2-J: Planned Routine Overhead and Underground Distribution Projects</u>

Spending for load driven distribution system improvements is planned to be higher in the 2015 – 2016 period than 2017-2018 in order to build two new substations (Waterfront Sub. 223 in 2016 and Mt. Vernon Area Sub. in 2020), rebuild one substation (Harrison Sub. 38 in 2017), add two new transformers to existing substations (Florida Ave. Sub. 10 and Northeast Sub. 212), install two 100 MVAR reactors at Alabama Ave. Sub. 136 and to add feeder capacity to accommodate predicted increased load growth at various stations. Projected spending for load driven projects will decrease in 2017 and 2018 because of the completion of Waterfront Sub. 223, the fourth transformers at Florida Ave. Sub. 10 and Northeast Sub. 212, and the reactors at Alabama Ave. Sub. 136, which will be completed prior to 2017. This will leave the last portion of the rebuild of Harrison Sub. 38 and the building of Mt. Vernon Square Area Sub. to be completed in those years.

SECTION 1.3 – MAINTAINING SYSTEM RELIABILITY

Pepco is committed to maintaining a safe and reliable electric distribution system and has programs in place that advance the operation of the electric distribution system by increasing the capabilities to monitor and analyze the performance of its system and enhance the ability to determine where to make modifications and additions to replace poorly performing equipment. Pepco monitors the performance of its distribution feeders system-wide. This process is performed annually and enables Pepco to analyze and determine the relative ranking of each feeder's performance from the least to the most reliable.

This section of the Consolidated Report addresses:

- Technology: Monitoring, Automation, and Information Systems;
- Equipment Standards and Inspections;
- Vegetation Management (VM) Program Detail;
- Industry Comparisons;
- Best Practices;
- Reliability Enhancement Work Plan;
- Storm Readiness.

1.3.1 TECHNOLOGY: MONITORING, AUTOMATION, AND INFORMATION SYSTEMS

Systems and Technology[15]

The discussion below addresses the Company's technology initiatives that contribute to improved reliability performance.

[15] In Order No. 12804 paragraph 53 E, the Commission ordered the following:
53. The 2003 PIP is hereby APPROVED, provided that PEPCO:
(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

SCADA[16]

The System Control and Data Acquisition (SCADA) System is the primary tool used by the System Operators to monitor and operate the electric system. This system provides the System Operator at the Control Center the ability to remotely monitor and operate all major equipment at all substations and selected equipment outside of the substations. It is through this system that the System Operator learns what is happening across the electric system and has the ability to take appropriate actions to maintain a safe and reliable system and restore service during outages.

The Remote Terminal Unit (RTU) at each substation gathers data from all substation monitored equipment, and provides an interface to pass the data to the central computer system, Energy Management System (EMS), and to the System Operator, who can then remotely control devices at each substation. Major equipment status (open or closed) and equipment metering (watt, var, voltage and ampere) is monitored by the Operator. Additionally, there are specific equipment alarms that indicate abnormal conditions like high temperature, low oil pressure or overloads on a particular device or feeder.

Pepco maintains its own extensive communication system that allows for direct communication between the RTUs at the substations and the computer system at the Control Center.

The computer system at the Control Center gathers the data from all the RTUs, analyzes the data, displays results to the System Operators, and provides the interface for the System Operator to remotely operate the system to protect equipment. Any change of electric system status at the substation is displayed to the System Operator within approximately 4 seconds. The system also provides various analyses. For example, it provides an indication if any substation equipment exceeds its capability limits. It does this by comparing the design limit

[16] The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 313 of the hearing transcript, Commissioner Meyers stated the following:

> *We're going to ask Pepco to please include a section on reporting and monitoring in the comprehensive plan… And just as a quick for instance of this real-time systems control and data acquisition system, SCADA, what could it do? Give me a for instance there.*

of the equipment with the present loading. Through the SCADA system automatic switching activities can be performed or the System Operator can take action manually to protect remote system equipment and relieve the condition that caused the equipment to be operating outside of its limits.

All raw data from the SCADA system (meter values and status changes) are retained and made available to those areas (System Planning, Distribution and Engineering, etc.) that need the data for analysis. The available data consists of meter values (watts, vars, volts and amps) and status (open and closed) of various facilities, equipment and feeders.

Substation Automation[17]

Although all 13 kV substations have full SCADA control, some 4 kV substations have only limited monitoring capability and do not have the full RTU capability that provides remote control and operation. At these substations all equipment status indications are grouped together on a substation basis and when there is a change of status, a single alarm point provides a single substation alarm indication. Personnel are dispatched to the substation to determine the specific problem. A project is underway to install full RTU capability in the Company's 4 kV substations that are not scheduled for conversion and retirement by installing smart relays on all critical equipment. This will provide for improved restoration capability and hourly data for analyses. The 4 kV substation RTUs completed by the end of 2014 were at G St Substation Sub. 28.

The following nine substations will be automated over the next ten years:

- Macarthur Boulevard Sub. 152
- Texas Avenue Sub. 111
- Fort Davis Sub. 100
- Fort Dupont Sub. 58
- 53rd Street SE Sub. 48
- Seat Pleasant Sub. 30
- Twining City Sub. 150 (under construction)
- Chesapeake Street Sub. 181

[17] Substation Automation and the following section, Distribution Automation, are also addressed in Sections 2.3.2.1 and 2.3.2.4, respectively, as PIP Projects.

- Congress Heights Sub. 64

In addition, conventional electro-mechanical relays are being replaced with new generation Smart Relays. Additional information provided by these relays is allowing for more effective and efficient operation. In certain applications, the smart relays can provide information with respect to the distance from the substation to the fault on the feeder. This will allow for faster troubleshooting of system problems, improved restoration capability and increased data for system analyses.

Distribution Automation (DA)

Additionally, as part of the DA projects, ten 13 kV substations have been equipped with upgraded Smart Relays and enhanced RTU's for improved visibility and control at these locations. Additional information provided by these relays will allow for more effective and efficient operation and will support the operation of the Automatic Sectionalizing and Restoration (ASR) system being installed at each location. The following ten 13kV substations, which supply load within the District of Columbia, have been equipped with enhanced RTU's and upgraded Smart Relays:

- 12th & Irving Substation
- Benning Substation
- Fort Slocum Substation
- Harrison Substation
- Little Falls Substation
- Van Ness Substation
- Green Meadows Substation (located in MD but serves some D.C. customers)
- Takoma Substation (located in MD but serves some D.C. customers)
- Tuxedo Substation (located in MD but serves some D.C. customers)
- Walker Mill Substation (located in MD but serves some D.C. customers)

In 2014, the Company expanded the ASR technology to include three additional feeders out of Van Ness Substation, one additional feeder from Benning Substation, and three additional feeders from 12th and Irving and Fort Slocum Substations. These seven feeders serve approximately 9,500 customers in the District of Columbia. ASR functionality for these seven feeders is expected to be activated in first quarter of 2016. The Anacostia area ASR plan has been deferred until technology planning for DC PLUG initiative is completed.

Pepco is also initiating a plan to install overhead fault detectors that would communicate back to the Control Center. This will improve outage response through quicker identification of fault locations. This work will commence once a smart fault indicator technology is selected, currently targeted for fourth quarter 2015.

Projects are underway to install additional 13 kV and 69 kV remotely operated switches on feeders in addition to the feeders associated with the ASR systems. The additional switches will allow more capability to isolate the faulted portion of the feeder and return more customers to service sooner. The remote control capability of these switches allows the System Operator to perform switching without the need for field crews, thus reducing customer outage time.

In regards to 69 kV remotely operated switches, all planned additions are in Maryland, but some do improve the reliability of power supply to customers in the District of Columbia. The Company completed its phase 1 and 2 plans to install 50 switches by end of year 2013 (four affecting substations that supply District load). Phase 3 of the project is currently underway which encompasses the installation of 18 switches (ten affecting substations that supply District of Columbia load). Fifteen switches were installed in 2014, with the remaining to be installed by mid-2015. In all, approximately 6,800 District of Columbia customers are impacted by the following planned 69 kV switch additions:

Subtransmission Substations	Distribution Supply Substations	2014/2015
Ritchie	Walker Mill Rd & Suitland	2
Bells Mill Road	Linden	2
Palmers Corner	Beech Rd & St. Barnabas Rd	6
Total		10

In addition, Pepco completed the installation, testing and integration of the network transformer remote monitoring system (RMS) on 41 network transformers in the Buzzard Point Network (in Southeast District of Columbia) in the fourth quarter of 2013. There have since been an additional 9 transformers installed on the Buzzard Point Network, which have all been equipped with RMS, as well as 49 transformers in the Sub 212 Southeast group. The installation of RMS on 60 network transformers in the Sub 212 Northeast Network (formerly referred to as the Benning Network, located in the Northeast District of Columbia), and on 75 transformer protectors in Sub 18 Central Network (located in Southwest District of Columbia) is currently in progress. Integration of the RMS data into the EMS for these two networks is expected to be completed by third quarter of 2015. These monitors will provide increased visibility and control capability for system operators to remotely open or close the network transformer protectors through two-way communications. Load, voltage, protector status, and equipment condition data are recorded for study and operating purposes, and for increased ability to schedule maintenance of this equipment. RMS will provide operational data to evaluate the performance of the transformer and protector, perform maintenance when needed and not just on a time-based interval, and allow opening the protector to disconnect network load from the transformer without the need to wait for a crew to manually operate the protector. This will provide great benefits during emergencies when there is a need to very quickly isolate a transformer from the network. The development of the RMS system and the initial installation at Buzzard Point are part of the Department of Energy Smart Grid Investment Grant (SGIG) that the Company received. The installations in the Northeast Network and the Sub 18 Central Network are part of the Company's long term plan to install RMS in all of its 49 networks which contain approximately 4,000 transformers.

Outage Management System (OMS)[18]

The OMS is the primary tool used to receive customer trouble reports, analyze reports and provide summary reports for crew dispatching. Typically the process starts with the customer reporting an outage by calling the Pepco Call Center or from an Advanced Metering

[18] In Order No. 13422 on the 2004 Consolidated Report, paragraph 66, the Commission ordered the following:

66. The 2004 Consolidated Report: Productivity Improvement Plan and Comprehensive Plan is hereby APPROVED, provided that PEPCO:

(a) Report in the 2005 Consolidated Report, due February 15, 2005, on the corrective actions taken to fix the OMS;

Infrastructure (AMI) meter reporting the loss of power. Information from that call or meter report is entered into the OMS system. The OMS database has the customer information, including customer phone number, address, and connected transformer. Additionally, the database contains the electrical network configuration of each feeder connecting each transformer to a feeder and the location of switches, fuses and taps. The system then analyzes all reported trouble by sorting the reports, prioritizing and grouping multiple problems to a common source. The analyzed data are then displayed to the System Operator for dispatch of crews to investigate and resolve the problem.

The SCADA system also provides input to the OMS. When a feeder breaker at a substation opens and the entire feeder is out, all customers connected to that feeder are known to be out of service. Information obtained from customers (pole struck, line down, tree limb on wire, etc.) in the OMS is then used to determine the source of the problem and to dispatch crews. For trouble involving these pieces of equipment, the customer trouble calls provide the data necessary to determine the problem. The OMS analyzes all the customer calls as well as AMI meter statuses and then determines the common source of the problem. Information is also passed back through the OMS to the Call Center to provide that information to the customer when they call in. This information includes knowledge of current trouble and estimated restoration time under non-major storm outage conditions.

Information Systems

<u>Customer Relationship Management and Billing System (CRMB)</u>

A new Customer Relationship Management and Billing system (CRMB) was implemented on January 5, 2015 to replace the legacy CIS system. Included in this development effort was a new bill format that presents data. The new bill format also includes enhanced presentment of budget billing and payment arrangement information, as well as a daily usage graph for AMI-activated accounts.

<u>Work Management Information System (WMIS)</u>

WMIS continues to be the primary tool used for construction and engineering work management at Pepco and is closely integrated with the Graphical Work Design (GWD) system.

SAP PM (Plant Maintenance)

SAP PM continues to be the primary tool used for maintenance work management at Pepco. Planned, periodic maintenance is scheduled through SAP PM, as is corrective work. In 2014, minor enhancements were made to the system to improve the work order process and work began on maintenance analytics and enabling mobile technology for substation inspections.

GIS/GWD System

Pepco started a project to upgrade the existing GIS/GWD system to the latest version in August 2013 and the system was deployed September 9, 2014. Pepco continues to deploy new functions offered by the GIS vendor for greater use of GIS data throughout the company. The GIS/GWD system continues to be Pepco's official database of field assets. The Pepco GIS/GWD system is also being used for the DC PLUG initiative, coordinating the work between the District of Columbia and Pepco.

Power Delivery Information System Projects[19]

Pepco's Power Delivery Information System Projects are provided in Table 1.3-A. Included in Table 1.3-A are historical information system projects for the years 2010 - 2014. All costs are for those allocated to the District of Columbia.

[19] In Order No. 12735, paragraph 139, the Commission ordered the following:
PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:…
(d) Listing of power delivery information system projects with implementation schedules, annual costs, and milestones;
(e) Listing of new technology investigations with decisions, annual costs, and implementation schedules;
…The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Rollup-1	Estimated DC Portion 2010	Estimated DC Portion 2011	Estimated DC Portion 2012	Estimated DC Portion 2013	Estimated DC Portion 2014
ROLLUP ($000s)

Table 1.3-A: Historical Information System Projects

1.3.2 EQUIPMENT STANDARDS & INSPECTIONS

Equipment Standards

Pepco establishes and maintains material specifications, engineering and construction standards and practices, and operating guidelines to support the efficient, safe, and reliable operation of the Pepco distribution system. Further, Pepco established and maintains guidelines for the design and operation of its four-wire 13 kV distribution system and guidelines for the design and operation of its low voltage AC network system located in the downtown business district. These guidelines ensure that the electric distribution system is constructed and expanded in a consistent fashion according to the Company's established standards, practices, and requirements, to support the safe and reliable operation of Pepco's distribution system and downtown network system.

In addition, Pepco evaluates new products and equipment upgrades to improve system reliability and evaluates the technical capabilities of potential equipment suppliers to validate that their products or services meet or exceed established Company specifications and requirements. Manufacturer inspections and equipment reviews are performed to verify that these established requirements are met.

Pepco has been actively involved in the standardization of major equipment across the PHI utilities, for such items as capacitors, regulators, switches, reclosers and transformers. The consistent construction standards are intended to support the consistent proper installation of equipment throughout the PHI regions for safe, reliable, and cost-effective operation.

Equipment Inspections[20]

A proactive inspection and monitoring program reduces the possibility of unexpected failures and secondary damage to surrounding units, and increases the opportunities that Pepco can plan for the replacement of impending problem equipment. The frequency of inspections and monitoring is based on Pepco's experience, manufacturers' recommendations, and/or industry practices. Inspections may lead to repair or replacement of transmission and distribution system components to maintain safety and reliability of the system.

Inspection and modeling activities identify equipment to be replaced due to loading or condition. Distribution line equipment such as transformers, cable, and other components are not subject to detailed electrical testing and are replaced only when physical inspection indicates a need for replacement. Other than those inspections, equipment is replaced when it is upgraded, relocated or fails.

As new technologies are installed, actual operational data will be available to better analyze the loading and performance of equipment. For example, load data from the AMI system can potentially identify overloaded transformers prior to failure.

[20] In Order No. 16091, paragraphs 63 and 46, the Commission ordered the following:

63. Pepco IS DIRECTED to provide a description of its maintenance policies and methodologies, consistent with paragraph 46 of this Order;

46. Decision. … we shall require that Pepco provide a list of the types of equipment for which a "run to failure" method applies and those for which a preventive method applies. (Footnote: If other maintenance methods are used, Pepco shall describe them as well.) The Commission requires that Pepco provide an explanation of why different maintenance methods apply to different types of equipment. We also require a description of the "test procedures" that Pepco uses to assess the performance and remaining life of the equipment. (Footnote: See Pepco comments at 7.) Further, Pepco shall provide an estimate of the current book value of equipment maintained under each method used by Pepco. The 2011 Consolidated Report shall include this description of maintenance policies and methods.

Table 1.3-B below provides a range of inspection or maintenance cycles for different classes of equipment. These were developed by weighing factors such as criticality, duty cycle, varying manufacturer's recommendations, and technological differences.

The equipment types and asset groups listed on Table 1.3-B have been designated as either a "preventive" or a "predictive" maintenance. It should be noted that Pepco views its overall maintenance methodology to be defined by "reliability-centered" practices, with predictive and preventive methodologies to be subsets of this reliability-centered focus.[21]

Table 1.3-B: Equipment Inspections

Equipment	Inspection	Periodicity	Maintenance Methodology
Substation	General Inspection	Monthly	Preventive
Substation Power Transformers	Predictive Maintenance Routine	Annually	Predictive
	Oil Collection and Analysis Of Transformer Main Tank And Load Tap Changer (LTC)	Twice yearly to once every two years based on Transformer MVA rating or triggered by Transformer Oil Analyst (TOA) Program Rating	Predictive
	Routine Inspection and Test	2 to 10 Years or more frequent, as recommended based on ECA Process	Preventive
	External Inspection and Test	N/A	Preventive
	LTC Filter Change	Where applicable and condition-based maintenance on high filter differential pressure	Preventive
	Routine Cooler Inspection	As recommended based on ECA	Preventive
Substation Capacitor Banks - Metal Enclosed	Routine Inspection	4 to 8 years or more frequent, as recommended based on an ECA	Preventive

[21] Table 1.3-B has been modified in response to the Commission's directive to "describe Pepco's maintenance methodology (reactive, preventive, predictive, and/or reliability-centered) for each equipment type or asset group listed," *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 354 (February 27, 2015).

Substation Capacitor Banks - Open Rack	Routine Inspection	3 to 5 years or more frequent, as recommended based on an ECA.	Preventive
Substation Capacitor Banks - Open Rack With Circuit Switcher	Routine Inspection	3 to 5 years or more frequent, as recommended based on an ECA.	Preventive
Substation Circuit Breakers – Air Magnetic	Predictive Maintenance (PDM) Tasks	Annually	Predictive
	Routine Test	4 to 8 years or more frequent, as recommended based on an ECA.	Preventive

Equipment	Inspection	Periodicity	Type
Substation Circuit Breakers – Oil	Oil Collection And Analysis Of OCB	1 to 5 years depending upon breaker application or triggered by Transformer Oil Analyst (TOA) Program Rating	Predictive
	Predictive Maintenance (PDM) Inspections	Annually	Predictive
	Internal Inspection and Test	As recommended based on the ECA Process.	Preventive
	Diagnostic Testing	Every 72 Months	Preventive
	Compressor Inspection/Pre-Charge Inspection (as applicable)	Every 24 Months - 36 Months	Preventive
Substation Circuit Breakers – SF6	Predictive Maintenance (PDM) Inspections – Non-intrusive	Annually	Predictive
	Routine Inspection – Intrusive	Performed as recommended based on ECA.	Preventive
	Diagnostic Testing	8 Years or more frequent, as recommended based on an ECA.	Preventive
Substation Circuit Breakers – Vacuum	Predictive Maintenance (PDM)	Annually	Predictive
	Routine Inspection	48 to 96 Months or more frequent, as recommended based on an ECA.	Preventive
Substation – 69 to 230kV High-Pressure Pipe-Type Potheads	Periodic Inspections where sample ports are available.	Every 4 to 6 years (230kV),	Preventive
		Every 6 to 8 years (115kV),	Preventive
		Every 8 to 10 years (69kV)	Preventive
Substation – Battery & Charger Systems	Visual & On-line Test/Inspection	Annually or more frequent as recommended based on an ECA.	Preventive
Substation – Building Heating, Ventilation and Air Conditioning (HVAC) System	Annual Inspection	Annually	Preventive
Substation – Emergency Generators	Start and Run Test	Annual Standby Generator and Inspection and Black Start	Preventive
Substation – Fire Protection Pump	Routine Inspection	Annually	Preventive
Right-of-Way Integrated VM (Transmission)	Routine Inspection	Interval based on Right-of-Way inspections and height of vegetation.	Preventive
Scheduled Tree Trimming - Overhead Distribution Feeders Not In Transmission Rights-of-Way	Routine and Condition-based Tree Inspection	Every 2 years	Preventive
Protective Relays and Automatic Reclosing Relays	Preventive Maintenance	4 to 6 years based on system voltage class	Preventive

Equipment	Inspection	Periodicity	Type
Under-Frequency Relays	Preventive Maintenance	6 years	Preventive
RTUs - SCADA	Predictive Maintenance	Failure to operate properly based on condition monitoring – self diagnostics, EMS trouble logs, real time data analysis, and remote communications.	Predictive
SCADA (Supervisory Control and Data Acquisition) Metering	Preventive Maintenance	Condition based maintenance	Preventive
Digital Fault Recorder	Preventive Maintenance	Every 48 Months	Preventive
Power Line Carrier (PLC)	Preventive Maintenance	Every 24 Months	Preventive
Microwave Equipment	Preventive Maintenance	Every 24 Months	Preventive
Fiber Optic Equipment	Preventive Maintenance	Every 2 to 4 years (Depending on Network)	Preventive
Leased Line	Preventive Maintenance	Every 24 Months	Preventive
Pole-Type Recloser	Routine Inspection	Visual - Annually, and Operational Test - Every 36 to 72 months	Preventive
Pole-Type Regulators	Routine Inspection/Test	Every 24 months	Preventive
Critical (Hospital/Nursing Home) Network Transformers/Protectors	Routine Inspection	Every 2 to 3 years	Preventive
Distribution and Subway Network Transformers/Protectors	Routine Inspection	Condition based – Every 3 to 10 years based on location and type of service	Preventive
Underground Network Transformers/Protectors	Routine Long Inspection	Every 5 years de-energized (Staggered w/Short Inspection so visits are 2.5 years apart). Inspection cycle for some locations may differ and be between 2 - 10 years based on: 1) criticality - hospital locations are inspected more frequently; 2) location type - sidewalk/roadway location or roof top/basement; and 3) installation type - junction box type installation.	Preventive
Underground Network Transformers/Protectors	Routine Short Inspection	Every 5 years energized (Staggered w/Long Inspection so visits are 2.5 years apart)	Preventive

Equipment	Inspection	Periodicity	Type
Capacitor Banks – Pole Mounted	Routine Inspection	Every 2 to 4 years	Preventive
Distribution Pad mounted Transformers / Switchgear	Routine Inspection	Every 10 to 20 years	Preventive
Pipe-Type Cable Joint Sleeves in Manholes	Periodic Inspection	Every 5 to 10 years	Preventive
Wood Poles	Wood Pole Inspection, Remedial Treatment and Restoration	*Every 10 years (starting in 2015)	Preventive
Power Line Over Navigable Waterway – Overhead Clearance	Routine Inspection	Not to exceed 5 years	Preventive
High Voltage Transmission Structure Aviation Warning Lighting	Periodic Inspection	Annually	Preventive
High Voltage Transmission Structure Grounding	Periodic Inspection	Inspect Grounding System on a 5 – 10 year interval	Preventive
Microwave Tower and Aviation Warning Lighting	Periodic Inspection	Annual or as per Federal Aviation Administration (FAA) recommendation	Preventive
High Voltage Transmission Line Comprehensive Inspection	Aerial Inspection	HV system will be inspected over a six year period.	Preventive
Cathodic Protection	Substation Inspection and Manhole Survey	Condition based – Various intervals (based upon type of work involved)	Preventive
Cable Oil and Gas Alarms	Annual Inspection	Annually	Preventive
Fluid Pressurizing Plants for High-Pressure Pipe-Type Cables	Operational Test And Inspection	Every 1 to 2 weeks (chart replacement), Every 1 to 2 years (operational test)	Preventive

Table 1.3-C includes the current book value of equipment. Current book values have been categorized by direct and allocable plant. The use of FERC Mass Asset Accounting does not allow any specific asset to be identified and linked to its accumulated depreciation and remaining useful life or to link it to the maintenance method applied to the equipment as assets are depreciated by account.

Overhead Feeder Inspection Program [22]

In 2012, Pepco initiated the Overhead Feeder Inspection program to evaluate feeder condition, identify future improvement opportunities, and remediate safety issues in the infrastructure of Pepco's overhead system to improve reliability.

The Overhead Feeder Inspection Program focuses on an individual feeder and follows that single feeder to its end, inspecting all of the different pieces of equipment along the feeder at one time. This provides the necessary field data and information to determine a feeder's general condition, compare it to performance data, and strategically implement the best solution or corrective actions to improve the feeder's overall reliability and avoid or mitigate future outage impacts.

Initially, Pepco set very aggressive targeted time frames for remediation of issues identified under this program. Based on the findings of Pepco's pilot effort in 2011 and consultation with the Company's contractor partner, who has experience implementing this type of program with several other utilities, Pepco learned that a more comprehensive approach to planning the remediation of conditions observed during inspections was needed. Further, the initial targeted time frames for remedial projects were out of sync with Pepco's REP planning and construction cycle. Typical project cycles for feeder improvement projects under the REP ran from 6 to 18 months depending on the scope of work identified. It simply was not possible to engineer, procure, and construct the added projects of the inspection program in the limited time periods specified.

Consequently, the prioritization of remedial work has been refined to require immediate or near term response on those issues that must be addressed to avoid imminent safety or reliability problems while less urgent conditions are required to be remediated within the normal design and build cycle for distributions projects. Finally, conditions which do not pose

[22] Order No. 16975 states the following at paragraphs 64 and 107:

> 64. *Decision: Pepco is directed to report on the Overhead Feeder Inspection Program in future Consolidated Reports as recommended by OPC and the Staff, including results of the inspections, actual and incipient failures detected and remediation actions taken to correct the nonconformance items recorded. In particular, as requested by OPC, Pepco is directed to report on replacement of lightning arresters.*
>
> 107. *Pepco is DIRECTED to report on the Overhead Feeder Inspection Program consistent with paragraph 64herein;*

a reliability or safety concern in either the near term or long term are identified for possible upgrade in conjunction with more urgent work scopes.

Repairs or upgrades to correct or eliminate conditions observed during inspections are scheduled under the following guidelines.

- Priority 1: A condition where upon inspection, a Pepco facility is deemed to present an imminent safety hazard to utility personnel and/or the public. In this case, steps shall be taken to immediately eliminate the hazard. Inspectors are required immediately notify Pepco and to stand by until relieved by Pepco personnel.
- Priority 2: A condition where upon inspection, a component of an overhead feeder is observed and confirmed to pose a threat to service reliability, but does not pose a direct public safety threat. Conditions under this category should be remediated within 90 days.
- Priority 3: A condition where damage or degradation exists on a component of an overhead feeder line, does not pose a direct public safety threat, and if left uncorrected, has the potential to affect service reliability under adverse system conditions. Conditions under this category should be remediated within 18 months.
- Priority 4: A condition that poses no threat to safety or reliability, but does not conform to current Pepco standards. Conditions under this category should be corrected when other work presents the opportunity to bring the condition to current standards.

Overhead Feeder Inspection Cycle

In 2014, Pepco re-evaluated the Overhead Feeder Inspection Program and decided to change the inspection strategy and program cycle, and the outcome of this decision was to implement a more aggressive two year cycle. Planning and scheduling for this acceleration slowed the inspection process in 2014, however, this change will result in approximately 50% of overhead feeders being evaluated in 2015, and ultimately result in all of Pepco's District of Columbia overhead feeders being inspected by approximately December of 2016. [23]

[23] The following table, Overhead Feeders Inspected 2011-2014, responds to the Commission's directive to Pepco to "provide in its 2015 Consolidated Report a table listing by year the overhead feeders that it has inspected under its Overhead Feeder Inspection Program, from the commencement of the Program through December 31, 2014, and, if known, the feeder numbers of the overhead feeders scheduled to be inspected by Pepco in 2015," *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 355 (February 27, 2015).

Overhead Feeders Inspected 2011-2014

Feeder No.	Year	Feeder No.	Year	Feeder No.	Year	Feeder No.	Year

Table 1.3-D: Overhead Feeder Inspection Program Priorities List

The conditions summarized in the table above, as observed during the overhead feeder inspection program in 2014, have been referred to the appropriate Engineering division for evaluation and implementation to address the conditions. Of the conditions identified on Table 1.3-D above, all P1 conditions identified were addressed. Remediation of all P2, P3, and P4 conditions identified in 2014 are pending, with all P2 conditions and P3 arrestor conditions scheduled to be remediated by April 17, 2015.

1.3.3 VEGETATION MANAGEMENT PROGRAM DETAIL

Each year, Pepco's system reliability is significantly impacted by trees and tree branches that have contacted, fallen on, or otherwise interfered with poles and wires, causing disruption of service. Due to the density of tree coverage in Pepco's District of Columbia service territory and public concerns relative to tree pruning, challenges exist when balancing the value of trees to customers and communities and the need for reliable electric service. The main objectives that the Vegetation Management (VM) program attempts to balance are safety, reliability, regulatory compliance, environmental stewardship, and customer satisfaction. Pepco's VM program includes all activities from tree pruning through tree removal, as appropriate, to reduce vegetation caused outages.

Pepco's VM priorities are:

- Achieving and maintaining a high degree of reliability across the entire electric system;
- Targeting areas of the electric system found to be most susceptible to outages and damage from trees;
- Performing cyclical pruning to maintain the stability of the system;
- Working with local stakeholders and property owners in the removal of hazard trees in close proximity to Pepco's electric lines;
- Communicating with customers through various media;
- Performing emergency tree and limb removal from electric lines; and
- Assuring that the VM work is performed consistently with good environmental stewardship.

Pepco's VM program in the District of Columbia includes:

- Scheduled two year cyclical maintenance or routine scheduled pruning;
- Unscheduled (non-cycle) maintenance operations; and
- Selective application of herbicide.

Pepco's VM process can be summarized in the following steps:

- Establish an annual VM plan strategy in accordance with regulatory requirements, International Society of Arboriculture Best Management Practices and Pepco VM goals;

- Plan Work – Inspect the feeder to develop a VM work plan that defines the work to be performed;
- Prune/Remove/Clear Trees – VM personnel engage qualified contractors and perform project management and contract administration to complete feeder maintenance as planned;
- Validate completion of work plan – Certified Arborist inspects to validate that work performed is completed in accordance with plan and American National Standards Institute (ANSI) standards; and
- Document and report progress.

Scheduled Pruning

Pepco's scheduled cycle tree maintenance program in the District of Columbia includes a comprehensive inspection by an International Society of Arboriculture (ISA) Certified Arborist to develop a work plan for each feeder on a two-year cycle in accordance with guidelines established in conjunction with the District of Columbia's Urban Forestry Administration (UFA) ANSI standards, and International Society of Arboriculture (ISA) Best Management Practices (BMPs).

Coordination with UFA

The UFA is responsible for the management of the majority of public space trees that grow in proximity to Pepco overhead facilities. Arborists from Pepco and UFA work to identify and eliminate hazardous tree conditions during cycle and unscheduled maintenance operations. Pepco also coordinates with natural resource managers from the National Park Service, the District of Columbia Department of Parks and Recreation, and private property owners.

Despite the good working relationship between Pepco and UFA, challenges remain, especially with respect to VM work associated with the so-called "legacy" trees. District of Columbia statutes and regulations from decades ago resulted in "legacy trees" that impact operations today and have historically limited the degree and technique of vegetation cutback from Pepco power lines. This has resulted in large trees growing through and in close proximity to conductors. Examples of the policies include the following:

1. Section 13 of "An Act for the Preservation of the Public Peace and the Protection of Property within the District of Columbia," approved July 29, 1892. (27 Stat. 324; District of Columbia Official Code § 22-3310) (Emphasis added.)

   1892: *"An act for the preservation of the public peace and the protection of property within the District of Columbia" …unlawful for any person willfully **top**, cut down, remove, girdle, **break, wound, destroy, or in any manner injure** ….any tree not owned by that person…"*

2. Policy produced by District of Columbia, June 9, 1960, "Trees in Public Space: Washington, DC," at pg. 17.

   1960: *"Utility lines must be cleared by the use of directional clearance methods only…..the removal of internal branches to permit passage of utility lines through the trees where necessary"*

Many of the older trees are in conflict with the Pepco distribution system such that the issues with the various trees cannot be resolved without cutting entire "legacy" trees down. No standardized practice or agreement currently exists to resolve these conflicts. Pepco continues to work with UFA to resolve these issues on a case-by-case basis and in accordance with the Vegetation Management Plan for Utility Tree Pruning – District of Columbia (2005 Plan).[24]

Mitigation and Tree Planting Programs

Pepco's tree planting funding mitigates removals and promotes "Right Tree Right Place" best management practices around utility space. In 2014 Pepco planted approximately 350 trees in Washington D.C., and contributed $17,239 to the D.C. Tree Fund.

Selective Application of Herbicide

Pepco's VM program includes an herbicide component. An herbicide plan is developed each year to control brush and sprout growth where trees have been previously cleared. Herbicide applications are used selectively on rights-of-way, easements and, when granted permission, on private property, throughout the Pepco system in the District of Columbia. The use of herbicides follows a systematic approach with the aim of supplementing manual or mechanical

[24] The 2005 Plan was produced as a result of a tree-trimming working group including members from the District Department of Transportation's Urban Forestry Administration and Pepco's Vegetation Management team. Pepco filed the 2005 Plan on March 17, 2005 in Formal Case No. 982.

tree/brush removal, re-establishing rights-of-way (ROW), carrying out aggressive wall pruning to remove undergrowth and overhangs, stop re-growth of incompatible species, maintain overall clearance and fight encroachment until the next cycle. The herbicides used on Pepco's ROW are extremely low in toxicity and are biodegradable. Most herbicides affect treated plants by inhibiting the production of chemicals which plants need to produce chlorophyll, or by inhibiting the formation of leaf-buds. Without chlorophyll production, or functional leaves, the treated plant exhausts its stored food supply and dies. Only herbicides registered by the U.S. Environmental Protection Agency (EPA) and D.C. Department of Environment (DOE) are applied in strict accordance with the label and under the regulation of United States Department of Agriculture (USDA). Pepco contract applicators are supervised by certified commercial pesticide applicators.

Customer Communication Materials

- Provide consistent notification to customers regarding Pepco's VM activities on their property and in their community;
- Provide information to customers explaining the VM program along with a schedule of trim and contact information;
- Make available Pepco forestry representatives to respond to inquiries as work is being done and scheduled;
- Encourage customers to access the Pepco website for more detailed educational material including links to American National Standards Institute (ANSI) A330 standards, Utility Arborist Association, and the "Right Tree, Right Place" program under the Arbor Day Foundation;
- Enable the planners to meet with customers and local officials, or correspond through mail, e-mail, and phone as needed;
- Enable work permits to be obtained in advance of scheduled work to allow work to continue in a coordinated and planned manner;
- Participate in community meetings; and
- Coordinate public awareness of Pepco's VM activities and programs through the use of door hangers that are placed on customer's door prior to start of VM work.

Below is a clip from the Company's 2014 communication materials related to its VM efforts in the District of Columbia. These materials are circulated to District of Columbia customers in accordance with pruning schedules, to inform customers about the planned pruning of trees on their property.

Customer Communications: VM

Pepco and the Arbor Day Foundation are offering free trees to help you conserve energy.

Trees are available on a first-come, first-serve basis from March 20 through June 6, while supplies last. Distribution is limited to two, 2-to-4 foot trees per customer. To get your free trees, visit www.arborday.org/Pepco today.

Properly planted trees help reduce energy use through summer shading and by slowing winter winds. As your trees grow, they will have the potential to lower energy bills by 15 to 30 percent.

pepco
Energy for a changing world.℠

To help you plant your tree in the right place, the Arbor Day Foundation offers you an online mapping tool that will:

- Map your house
- Show you the right trees for your area
- Locate the best place to plant them
- Calculate how much you can expect to save

To learn more about this program, please visit www.arborday.org/pepco

ENERGY-SAVING TREES

Arbor Day Foundation®

1.3.4 INDUSTRY COMPARISONS[25]

The Industry Comparisons section contains industry comparisons of transmission and distribution operations and performance. The comparisons of reliability indices are provided in Figures 1.3-A through 1.3-D in response to Commission directives in Formal Cases No. 766 and 982.

Institute of Electrical and Electronics Engineers (IEEE) Benchmarking Survey Results

Each year, Pepco participate in the annual Transmission and Distribution System Benchmarking Study conducted by IEEE. The 2013 Benchmarking Study was developed by IEEE using member companies' actual 2012 data and applying IEEE standards for determining Major Event Day exclusions. Included in this section are comparisons of 2013 SAIDI, SAIFI and CAIDI performance indices for the member utilities of the IEEE benchmarking survey.

Although Pepco's District of Columbia service territory did not participate separately in the study, the Company has calculated separate values for Pepco's District of Columbia territory in both 2013 and 2014, using equivalent Major Event Day exclusions, and has indicated both of these reliability results on the following charts. Note that while Pepco's 2014 reliability results that are reported in the following graphs are not directly comparable to the data used in the 2013 study, the Company's 2014 results clearly illustrate the significant improvement made by Pepco since 2013. See Figure 1.3-A through Figure 1.3-D.

[25] In Order No. 15568 paragraph 57, the Commission ordered the following:
57. Pepco IS DIRECTED to provide a report on the Electric Utilities Best Practices, consistent with Paragraph 50 of this Order. This report shall be included in that 2010 Consolidated Report; and shall include the best practices of the electric utility industry on improving reliability and outage restoration (from the Benchmarking Studies). Pepco shall submit a continuous improvement plan, including resourcing, specific performance targets, and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparable) utilities in the Benchmarking Studies.

1.3.5 BEST PRACTICES

Implementation of Twenty Best Practices[26,27,28,29]

[26] In Order No. 16091 paragraph 61, the Commission stated the following:

61. Pepco IS DIRECTED to include a "2011 Best Practices Report" in its 2011 Consolidated Report describing its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program, consistent with Paragraph 22 of this Order;

22. Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568. Second, as to the Staff's Recommendation that Pepco file a "Best Practices Report" from the PA Consulting's 2009 Polaris Transmission and Distribution Benchmarking Program, we agree that a report may be helpful in assuring that best practices continue to be implemented. Therefore, the Commission shall require that Pepco include in its 2011 Consolidated Report a section entitled "2011 Best Practices Report" in which Pepco shall describe its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program included in the 2010 Consolidated Report as Appendix 2D. The twenty best practices selected by Pepco should be those judged to have the most impact on reliability and outage restoration performance. Pepco shall report on all its activities during 2010 to implement these best practices, including data on staffing levels, expenses and results. This requirement is separate from the requirement to produce a "Continuous Improvement Plan," as is described more fully in Section IV.A.1.f.

[27] In Order No. 15632 issued in these proceedings, the Commission states at paragraph 5 the following:

5. Pepco shall file with the Company's annual Consolidated Reports to the Commission data on the Company's measures to continue to address each of the recommendations made by PA Consulting and the effectiveness of the Company's approaches to improve CAIDI and SAIDI to at least the average of PA Consulting benchmarks. This obligation shall begin with the 2010 Consolidated Report.

[28] Order No. 16623 states the following at paragraphs 29 and 52:

29. Decision: The Commission agrees with the Staff that the information provided in the 2011 Consolidated Report does not allow a complete assessment of Pepco's progress in implementing the twenty "best practices." Therefore, we direct Pepco to provide further information for each "best practice," including staffing levels, expenses and schedules and percentage of completion. In those cases where no incremental expenses or staffing occurred, we require Pepco to identify the other activities with which these best practices were combined "for efficiency" and provide expenses and staffing levels associated with those activities. In order to provide a comparative analysis, we require Pepco to provide budget vs. actual expenses and staffing levels for the period 2007 to 2011. We also require Pepco to provide an assessment of the progress it has made in fully implementing each best practice. In addition we require Pepco to identify whether and how each best practice has been incorporated within its Comprehensive Reliability Plan.[96] This information shall be included in the 2012 Consolidated Report.

52. Pepco is DIRECTED to prepare a report on best practices consistent with paragraph 29 herein;

[29] Order No. 16975 states the following at paragraphs 85 and 114:

85. Decision: The Commission finds that Pepco has failed to comply completely and explicitly with the requirement that it identify "whether and how each best practice has been incorporated within its Comprehensive Reliability Plan." While Pepco includes some of its best practices as part of the REP, it does not discuss each best practice, as required by Order No. 16623. The Commission agrees with OPC that "including these practices within the REP would be an effective means for improving reliability." Pepco is required to fully address the role that each best practice has in the REP in its 2013 Consolidated Report and in future Consolidated Reports. If a best practice is not part of the REP, then Pepco shall explicitly state that fact.

114. Pepco is DIRECTED to address the role each best practice has in the Reliability Enhancement Plan consistent with paragraph 85 herein;

Pepco continues to follow the best practices discussed in the 2014 Consolidated Report. The status, maturity/implementation levels, staffing impacts and REP drivers remain unchanged.

Approximate Costs Attributable to the District of Columbia

Regarding the costs of implementing best practices, Pepco must provide the following explanations:

1. **Cost allocation across companies and jurisdictions:** Many of the activities associated with the best practices described herein are performed by centralized teams supporting all of PHI's companies or teams supporting Pepco system-wide. Budgets and expenditures of departments that serve all of PHI are not directly attributable to one jurisdiction or another.
2. **Redirection of resources:** The implementation of some best practices by these teams did not necessarily require additional resources, but rather either required the allocation of additional duties or a shift in duties from previous practices to the newly-identified best practices. Further, activities supporting the best practices are only a subset of all work done by these departments, and the activities of many of the primary personnel involved in executing and advancing these best practices are allocated to general overhead accounts.
3. **Reported best practices costs:** The Company has attempted to allocate estimated resource hours and associated activity based costs in these centralized functions to the District of Columbia where possible. (See Table 1.3-E.) Where defined expenditures for process and reliability improvement exist, Pepco cites these expenditures in the attached table.

Best Practice #	Activity Supporting Best Practices	Average Hourly ATP*	Approximate Costs Attributable to District of Columbia															
			2007		2008		2009		2010		2011		2012		2013		2014	
			Hours	Cost	Hours	Cost	Hours	Cost	Hours	Cost	Hours	Cost	Hours	Cost	Hours	Cost	Hours	Cost

Table 1.3-E: Approximate Costs Attributable to the District of Columbia

ECA Team[30][31]

Pepco completed four quarterly ECA meetings in 2014. As a result of the ECA, Pepco replaced two large power transformers (TR) (Southwest 3 TR, Southwest 4 TR) and a smaller power transformer (12th Street 1 TR).

and is in the process of replacing another larger power transformer (New Jersey Avenue 4 TR). For 2015, Pepco is scheduled to replace seven more power transformers [O Street #1 TR (DC), Palmer Corner #3 TR (MD), Suitland #2 TR (MD), Norbeck #2 & #4 TRs (MD), and Rossmoor #1 & #2 TRs (MD)].

Pepco also repaired four Transformer Load Tap Changers (LTCs) (Twenty Second Street #4 TR; Florida Avenue #2 TR and #4 TR; Tenth Street #2 TR) and conducted 32 LTC Inspection/Test PM during the year 2014.

Pepco replaced one circuit breaker in the District of Columbia (Buzzard Point 1B 13843) as a direct result of the ECA process. In addition, Pepco is scheduled to replace up to eighteen large substation circuit breakers budget in the District of Columbia from 2015-2018.

Pepco has also replaced six station battery banks (Fifty Third Street, Alabama Avenue # 1 & 2, Southwest, and Benning #1 & 2) in the District of Columbia in 2014 as a result of the ECA process.

---

[30] Order No. 16975 states the following at paragraphs 39 and 98:

39. *Decision: …Specifically, the Commission directs Pepco to report on the recommendations and actions taken by the ECA team, including membership lists, meeting dates and minutes, analyses of impact of the ECA team on maintenance or replacement policies and asset management strategy and tactics. We also require Pepco, to the extent not already included, to report on costs for recommended equipment replacements and the projected benefits of those replacements, as OPC suggests. Further, the Commission directs Pepco to provide an explanation of how the work of the ECA team relates to other Pepco reliability initiatives and include a discussion of the equipment failure analysis as part of future years' Consolidated Reports.*
98. *Pepco is DIRECTED to include a report on the results of its Equipment Condition Assessment work consistent with paragraph 39 herein;*

[31] The ECA minutes have been modified in response to the Commission's directive "to include a brief description of the project status *(i.e.*, whether it is deferred, completed or ongoing)," *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 231 (February 27, 2015).

Included at the end of this section are the ECA membership lists, meeting dates and minutes (which include the analyses) for four quarters of 2014.

A discussion of costs and benefits, as required by Order No. 16975, is provided below.

ECA driven projects generally consist of planned projects to replace large, high cost, long lead time primary components within substations. Targets for these projects are usually selected by condition based criteria such as dissolved gas in oil analysis. However, due to certain external drivers (such as load, location, environment and system criticality), these replacements may also be triggered by historic performance of a component. These projects are primarily driven by Pepco's need to manage contingency risk and do not result from cost / benefit analysis. Replacements are usually in-kind or upgrades depend on component availability at the time. System emergencies can alter the prioritization of these projects.

The utility's obligation to serve requires substation design criteria which provides redundancy and risk management. Although substation component failures are rare in comparison to feeder components, the loss of a critical substation asset could result in long term outages affecting thousands of customers. The provision of redundant components, backup sources, and minimization of single points of failure in substation designs reduces this risk and generally allows Pepco to perform routine maintenance and upgrades without the need for planned outages. This redundancy also allows Pepco to manage contingencies and continue service despite the loss of a major substation component. As such, substation reliability is maintained by keeping both the primary and redundant assets in good working condition. Therefore, condition and criticality of assets predominantly drives substation reliability programs and many projects in the substation reliability category do not directly translate to improvements in outage frequency and duration. This concept is known as Reliability Centered Maintenance (RCM), the principles of which dictate that predictive maintenance activities serve to identify failing assets prior to catastrophic failure.

Substation assets are inspected under various inspection programs, including visual, infrared, and oil sampling where applicable. Based on observed condition and potential system risk, assets are cleared for normal duty, scheduled for closer monitoring, scheduled for maintenance, selected for immediate replacement, or added to prioritized programmatic replacement programs, as appropriate. Pepco's ECA process is the vehicle used to identify substation assets for condition-driven replacement in order to maintain the reliability of the substation. The ECA process cooperatively analyzes major equipment condition, makes major repair / replace decisions utilizing various subject matter experts and through consensus, prioritizes candidates for replacement on a quarterly basis.

Substation assets such as transformers, breakers, and larger components typically have long lead times and must be ordered well in advance (months to years) of anticipated need. For this reason, a number of replacement projects are kept in the project pipeline at any given time. This allows Pepco to substitute one project for another in situations where long lead times would subject the system and customers to significant reliability risk. Projects are engineered and built using standard designs and approved equipment.

Generally, substation reliability projects cannot be translated into measurable or forecasted SAIDI or SAIFI benefits. The presence of redundant systems within substations reduces or eliminates the direct threat to customer reliability from the loss of a single asset. However, the failure of such assets reduces the security of supply to feeders and elevates the risk of large scale customer outages. Given the potential for customer impacts along with the long replacement cycle of major substation assets, Pepco replaces these assets proactively based on condition assessment and the desire to manage such contingency risk.

PHI Pepco-DC Region Equipment Condition Assessment

Meeting Minutes - 1Q 2014 (4/28/14)

Transformers

Work Priority:

- Sub 21 L Street – 2 TR – $2.0 million estimated cost. DC; Distribution Substation. Serves feeders: 14501, 14507, 14502, 14508, 14504, 14511, 14503, 14510, 14505, 14509, 14506, and 14512. (Keep monitoring oil and gas)

- Sub 126 12th Street – 3 TR – $1.3 million estimated cost. DC; Distribution Substation. Serves feeders: 370, 218, 371, 232, 230, and 233. (Keep monitoring oil and gas)

2014 Capital Work:

- Sub 18 Southwest – 3 TR (Replace) – $4.4 million actual cost. DC; Distribution Substation. Serves feeders: 15619, 15307, 15294, 15613, 15607, 15301, 15302, 15309, 15620, 15298, 15604, 15604, 15871, 15303, 15621, 15296, 15611, 15308, 15615, 15624, 15605, 15299, 15311, 15875, 15306, 15305, 15623, 15601, 15297, 15310, 15309, 15606, 15610, 15295, 15616, 15874, 15622, 15312, 15304, 15603, 15609, 15614, and 15872. (Working on it)
- Sub 18 Southwest – 4 TR (Replace) – $4.4 million estimated cost. DC; Distribution Substation. Serves feeders: 15619, 15307, 15294, 15613, 15607, 15301, 15302, 15309, 15620, 15298, 15604, 15604, 15871, 15303, 15621, 15296, 15611, 15308, 15615, 15624, 15605, 15299, 15311, 15875, 15306, 15305, 15623, 15601, 15297, 15310, 15309, 15606, 15610, 15295, 15616, 15874, 15622, 15312, 15304, 15603, 15609, 15614, and 15872. (Working on it)
- Sub 161 New Jersey – 4 TR (Replace) – $2.1 million estimated cost. DC; Distribution Substation. Serves feeders: 496, 495, 345, 499, 348, 347, 479, 349, and 494. (Plan to be done this year)

2017 Capital Work:

- Sub 38 Harrison – 1 TR (Trend) – $1.3 million estimated cost. DC; Distribution Substation. Serves feeders: 14501, 14628, 14894, 14891, 14352, 14898, 14900, 14629, 14895, 14899, 14893, 14896, 14897, 15930, 14351, 14890, and 14892. (Keep monitoring oil and gas. Will be retired in 2017)
- Sub 126 12th Street – 1 TR (Replace) – $1.3 million actual cost. DC; Distribution Substation. Serves feeders: 370, 218, 371, 232, 230, and 233. (Keep monitoring oil and gas. Will be retired in 2017)

Action Items:

Substation Engineering Action Items:

- Sub 150 Twining City 3 TR, need update
- CVG092 Old Naval Hospital 1 TR, on hold per customer

Asset Performance & Reliability Action Items:

- Blue Plains 23106 and 23107, sponsor the replacements in 5 years budget
- Sub 2 O St. 1 TR, sponsor a replacement in 10 years plan

Chemistry Lab Action Item:

- Sub 126 12th St. 1 TR, sample oil

Distribution Engineering Action Item:

- CVG120 DC Village B-1413 Feeder 14758, need an update

Load Tap Changers

Work Priority:

- Sub 129 Van Ness – 1 TR – $3.5 million estimated replacement cost. DC; Distribution Substation. Serves feeders: 14150, 14149, 14147, 15867, 14301, 14321, 14144, 14625, 14142, 14328, 14145, 14324, 14302, 14143, 14139, 14322, 14132, 14148, 14306, 14134, 14133, 14624, 14303, 14141, 14329, 14325, 14140, 14323, 14304, 14330, 14136, 14626, 14327, 14305, 14146, 14135, 14326, 15943, 15944, 15945, 15946, 15947, 15948, 15949, and 15950. (Keep monitoring oil and gas)
  Trend

2014 Capital Work:

- ~~Sub 52 Tenth Street – 2 TR. **Completed**~~
- Sub 52 Tenth Street – 4 TR. (On going)
- Sub 146 Oliver Street – 1 TR – $1.3 million estimated cost. DC; Distribution Substation. Serves feeders: 128 and 467. (On going)

Action Items:

Asset Performance & Reliability Action Item:

- Sponsor Sub 150 Twinning City 3 TR, sponsor a replacement in 10 years plan

Breakers

2014 Capital Work:

- Sub 42 Buzzard – 1B 13843 – $300K estimated cost. DC, Circuit breaker. Serve feeder 13843. (Keep monitoring oil and gas)
- Sub 42 Buzzard – K2-32 – $300K estimated cost. DC, Circuit breaker. (Keep monitoring oil and gas)

2017 Capital Work:

- Sub 190 Fort Slocum – 3B 69054, $175,000 estimated cost. DC, Circuit breaker. Serve feeder 69054. (Put it in 2017 budget)

Action Items:

Asset Performance & Reliability Action Items:

- O Street Sub 2 – Sponsor four breaker replacements in capital budget
- Tenth Street Sub 52 – Sponsor four breaker replacements in capital budget

Substation Engineering Action Item:

- Buzzard Point Sub 42 – Budgeted 5 years replacements of eight breakers

Meeting Attendees:

[Names redacted and replaced with department and job title.]

- Asset Performance: Mgr Asset Performance NERC, Sr Supervising Engineer NERC, Lead Engineer NERC, Engineer 2 NERC, Supervising Chemist NERC
- Electric Maintenance: Sr Engineering Associate NERC
- Pepco Distribution Planning: Sr Supervising Engineer NERC, Lead Engineer NERC
- Pepco Substation Engineering: Sr Supervising Engineer NERC, Engineer 2 NERC, Manager of Substation Engineering – Pepco, Technical Assistant A NERC

- Pepco-System Operations: Sr System Operator NERC, System Operations Work Coordinator NERC, Mgr Control Room Ops NERC
- Substation Eng T&D: Mgr Substation Engineering NERC
- Corporate Insurance: Finance & Treasury Manager NERC

Meeting Minutes - 2Q 2014 (7/15/14)

Transformers

Work Priority:

- Sub 21 L Street – 2 TR – $2.0 million estimated cost. DC; Distribution Substation. Serves feeders: 14501, 14507, 14502, 14508, 14504, 14511, 14503, 14510, 14505, 14509, 14506, and 14512. (Keep monitoring oil and gas)
  Trend oil
- Sub 126 12th Street – 3 TR – $1.3 million estimated cost. DC; Distribution Substation. Serves feeders: 370, 218, 371, 232, 230, and 233. (Keep monitoring oil and gas)
  Trend oil
- CVG092 Old Naval Hospital 1 TR (Trend) (Keep monitoring oil and gas)

2014 Capital Work:

- ~~Sub 18 Southwest – 3 TR (**Work Completed**) – $4.5 million actual cost. DC; Distribution Substation. Serves feeders: 15619, 15307, 15294, 15613, 15607, 15301, 15302, 15309, 15620, 15298, 15604, 15604, 15871, 15303, 15621, 15296, 15611, 15308, 15615, 15624, 15605, 15299, 15311, 15875, 15306, 15305, 15623, 15601, 15297, 15310, 15309, 15606, 15610, 15295, 15616, 15874, 15622, 15312, 15304, 15603, 15609, 15614, and 15872.~~
- ~~Sub 18 Southwest – 4 TR (**Work Completed**) – $3.5 million actual cost. DC; Distribution Substation. Serves feeders: 15619, 15307, 15294, 15613, 15607, 15301, 15302, 15309, 15620, 15298, 15604, 15604, 15871, 15303, 15621, 15296, 15611, 15308, 15615, 15624, 15605, 15299, 15311, 15875, 15306, 15305, 15623, 15601, 15297, 15310, 15309, 15606, 15610, 15295, 15616, 15874, 15622, 15312, 15304, 15603, 15609, 15614, and 15872.~~
- ~~Sub 126 12th Street – 1 TR (**Work Completed**) – $1.3 million actual cost. DC; Distribution Substation. Serves feeders: 370, 218, 371, 232, 230, and 233.~~
- Sub 161 New Jersey – 4 TR (Replace) – $2.1 million estimated cost. DC; Distribution Substation. Serves feeders: 496, 495, 345, 499, 348, 347, 479, 349, and 494. (Plan to be done this year)

2017 Capital Work:

- Sub 38 Harrison – 1 TR (Trend) – $1.3 million estimated cost. DC; Distribution Substation. Serves feeders: 14501, 14628, 14894, 14891, 14352, 14898, 14900, 14629, 14895, 14899, 14893, 14896, 14897, 15930, 14351, 14890, and 14892. (Keep monitoring oil and gas. Will be retired in 2017)

Other Work:

- Sub 83 Blue Plains Reactor (R)-23106 and R-23107 replacement in next 5 years
- Sub 2 O St. 1 TR replacement in next 10 years

Action Items:
Substation Engineering Action Item:

- Sub 150 Twining City 3 TR, need an update

Load Tap Changers

Work Priority:

- Sub 129 Van Ness – 1 TR – $3.5 million estimated replacement cost. DC; Distribution Substation. Serves feeders: 14150, 14149, 14147, 15867, 14301, 14321, 14144, 14625, 14142, 14328, 14145, 14324, 14302, 14143, 14139, 14322, 14132, 14148, 14306, 14134, 14133, 14624, 14303, 14141, 14329, 14325, 14140, 14323, 14304, 14330, 14136, 14626, 14327, 14305, 14146, 14135, 14326, 15943, 15944, 15945, 15946, 15947, 15948, 15949, and 15950. (Scheduled Preventive Maintenance)
  Trend

2014 Capital Work:

- ~~Sub 10 Florida Avenue – 2 TR and 4 TR. (**Completed**)~~
- ~~Sub 124 Twenty Second Street – 4 TR. (**Completed**)~~
- Sub 146 Oliver Street – 1 TR (Replace the transformer) – $1.3 million estimated cost. DC; Distribution Substation. Serves feeders: 128 and 467. (Plan to be done this year)

Action Items:
Asset Performance & Reliability Action Items:

- Sponsor Sub 150 Twinning City - 3 TR in 10 years replacement plan
- Sponsor Sub 2 O Street – 1 TR replacement

Breakers

2014 Capital Work:

- Sub 42 Buzzard – K2-32 – $300K estimated cost. DC, Circuit breaker. (On going)

2017 Capital Work:

- Sub 190 Fort Slocum – 3B 69054 $175,000 estimated cost. DC, Circuit breaker. Feeder 69054 (Put in 2017 budget)

Action Items:
Asset Performance & Reliability Action Items:

- O Street Sub 2 – Sponsor four breaker replacements in capital budget
- Tenth Street Sub 52 – Sponsor four breaker replacements in capital budget

System Operations Action Item:

- Sub 42 Buzzard – K2-32 breaker, provide an outage schedule to replace the breaker.

Batteries

Work Priority:

- Sub 13 Harvard Street – Battery 1 – $95,000 estimated cost for replacement. DC. Battery (Plan to be done this year)
- ~~Sub 48 Fifty Third Street – Battery 1 **(Completed)**~~
- ~~Sub 136 Alabama Avenue – Battery 2 **(Completed)**~~

Meeting Attendees:

- Pepco-System Operations: Sr System Operator NERC, System Operations Work Coordinator NERC
- Corporate Insurance: Finance & Treasury Manager NERC
- Power Delivery Process Managers: Process Owner Maintenance NERC
- Substation Eng T&D: Mgr Substation Engineering NERC

1.3.6 RELIABILITY ENHANCEMENT WORK PLAN

Consolidated Report and Reliability Enhancement Plan[32]

The REP provides a comprehensive strategic framework for improving the reliability of the Company's distribution system, and assigns metrics for evaluating the successes and assessing necessary strategic changes to improve system performance. As of 2015, Pepco has incorporated the REP elements, their processes, and the lessons learned from their implementation into its normal Reliability, Load, and Vegetation Management programs. In future reports, progress on the REP elements will be reflected in their respective sections, thereby avoiding redundancy and reducing potential confusion.

The following section explains each of the elements of the Reliability Enhancement Work Plan in detail. Examples of projects not included in the REP are customer-driven work (e.g., the connection of new customers), emergency response work, and other general projects (e.g., information technology projects). Matrices of costs, budgets, and timelines for REP activity follow. This section concludes with a detailed explanation of the REP Performance Metrics that the Company will use to assess its progress with respect to the REP.

The projects outlined within this plan are designed to both reduce outages where historically outages have occurred and to prevent future reliability problems. Mitigation of future reliability problems can be achieved in multiple ways, such as replacement of specific types of equipment that are demonstrating an increased failure rate or proactive replacement of entire systems as is done with the 4 kV conversion program. This conversion program replaces equipment that has reached the end of its useful life and without replacement would result in a decreased reliability performance for that equipment. The work on priority feeders is performed to reduce outages on the feeders that have demonstrated poor performance over a past twelve-month period.

[32] In Order No. 16623 issued on Pepco's 2011 Consolidated Report, the Commission states the following at paragraphs 47 and 61:

47. *We are also concerned about the relationship between the Consolidated Report and activities Pepco is undertaking pursuant to its Reliability Enhancement Plan. We need to be clear on which Distribution Projects are part of Pepco's normal on-going improvement projects, and which are part of the "enhancement." Therefore, we require the Pepco provide a discussion in the 2012 Consolidated Report which identifies each subset of those projects and includes detailed project costs and schedules, which, where appropriate, correspond to the Reliability Enhancement Plan.*
61. *Pepco IS **DIRECTED** to provide an explanation of the relationship between its Consolidated Report and its Reliability Enhancement Plan consistent with paragraph 47;*

Other projects are designed to add new capacity, maintain system voltages or replace facilities based on information gained from inspections or system modeling, with the goal of maintaining continued system reliability. In all of these cases, the system enhancements are to prevent future outages from occurring. In some cases, a project will provide both a reduction in the types of outages experienced in the past as well as prevention of future outages. These projects generally involve equipment replacement or installation of modern automation equipment. Several different terms have been used in the past to describe this collection of initiatives. Going forward to reduce confusion, and to be able to explain this work to Pepco customers, the common term of Reliability Enhancement Plan (REP) is used across Pepco.

Reliability Enhancement Work Plan (2015-2019)

1. Introduction

Pursuant to Commission Order No. 15568, Pepco was directed to "submit a continuous improvement plan, including resourcing, specific performance targets and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparably) utilities in the Benchmarking Studies." As such, Pepco submitted its Comprehensive Reliability Plan[33] for the District of Columbia.

The current REP strategy in the District of Columbia is comprised of the following initiatives:

- VM;
- Feeder Improvement;
- Underground Residential Distribution (URD) Cable Replacement and Enhancement;
- DA; and
- Load Growth/Conversions.

[33] Since the initial order that required the filing of the Company's Comprehensive Reliability Plan (CRP) the Company has developed and filed with the Commission a Reliability Enhancement Plan (REP). These terms are interchangeable.

2. VM

Pepco's VM program is an important part of Pepco's REP. Due to the density of tree coverage in Pepco's service territory and public concerns relative to tree pruning, challenges exist when balancing the value of trees to customers and communities and the need for reliable electric service. The main objectives that the VM program attempts to balance are safety, reliability, regulatory compliance, environmental stewardship, and customer satisfaction. Pepco's VM program includes all activities from tree pruning through tree removal, as appropriate, to reduce vegetation caused outages.

2.1 Standard VM

Reliability and Feeder Selection Process

Pepco's VM program in the District of Columbia is performed on a two-year cycle. Each overhead feeder in the District of Columbia is scheduled for pruning once every two years. In addition to the feeders to be pruned based on the two-year cycle, the annual VM cycle includes feeders in the Feeder Improvement program where the installation of new equipment requires the removal of additional vegetation.

Regulatory Compliance and Benefits of Cycle-Based Pruning

VM strategies are performed on the list of feeders to assure that all feeders are trimmed on an established cycle. In the District of Columbia, the trim cycle is at least once every two years.

Cycle-based pruning refers to a pruning plan that is based on a pre-set, consistent cycle. The amount of vegetation cleared is based on the average re-growth of the species, so that adequate clearance from conductors can be maintained by re-visiting the same spans on a consistent cycle, with some variation based upon the characteristics of the vegetation, the construction of the feeder and past jurisdictional requirements.

VM for Feeder Improvement

Each year, Pepco selects distribution feeders for further remediation under the Feeder Improvement program, including Priority Feeders, and feeders, based on their feeder performance during the previous 12 months. Selected feeders are inspected and, where appropriate, VM work is performed. VM for feeder improvement projects is identified and planned to clear and resolve vegetation conflicts related to the feeder improvement project.

2.2 VM Program Components

Pepco's VM program in the District of Columbia is comprised of several components whose objective is the removal of those vegetation hazards that have the greatest impact on system reliability, including:

1. Removal of hazard and weak species trees which threaten overhead distribution feeders;
2. Removal of overhanging limbs where possible; and
3. Removal of undergrowth to provide increased access to off-road poles.

The VM program prioritizes the removal of limbs that overhang the mainline three-phase distribution lines wherever possible. For example, overhanging limbs frequently cause damage to facilities resulting in outages when the limbs fall and come in contact with overhead feeder lines. Pepco targets overhangs in the wire zone, and proceeds to remove the overhanging limbs in situations in which Pepco has the right to do so.

Similarly, just as overhanging tree limbs above a circuit present risk to the system, so does unmanaged undergrowth. Fast growing trees, vines, invasive species, and shrubs growing under the substation supply lines and mainline distribution system are removed, mowed, or treated with herbicides for public safety, accessibility, and reliability reasons. Where possible, Pepco allows and encourages the growth of low-growing species of vegetation.

The removal decision is made based on the circumstances, as often times undergrowth is low quality, invasive, and opportunistic in nature. Moreover, clearing of undergrowth has benefits because it allows for increased sight lines and access along roadways. The removal of low growing vegetation allows for healthy understory growth or promotes compatible maintenance. Controlling incompatible vegetation allows more growing space for low-growing grass and permits more selective and lower disturbance rates as natural competition between plant species – and the activity of wildlife – promotes biological controls.

Hazard Trees

Pepco's District of Columbia VM program defines hazard trees as dead, dying, or mechanically damaged trees within physical reach of Pepco facilities. As such, not all trees that are within the reach of the overhead lines are defined as hazard trees. Professional foresters and International Society of Arboriculture Certified Arborists identify trees that threaten the reliability of the system and work with the owners or controlling authority of the trees to achieve safe and timely removal of the trees before they can cause outages. However, the owner or controlling authority often have a higher risk tolerance when considering the corrective action and urgency of hazard trees; that is, UFA or others may tolerate a condition to persist that Pepco considers hazardous.

When they are identified, tree risk assessments are performed on trees with the following characteristics:

- Any tree that constitutes a serious line or facility threat;
- Trees or limbs with included bark, weak limb attachments, and mechanical damage;
- Trees under low level primary circuits that have been topped with no clearance for further foliage growth;
- Badly diseased, dead, or dying trees;
- Trees growing in shallow soil or on an unstable earthen bank which may be subject to wind throw;
- Trees that for any other reason are such that adequate clearance cannot be obtained; and
- Trees requiring more than 25% of crown removal to obtain proper two year clearance requirement or limb overhang removal.

Pepco plans to submit updates to its work on hazard trees in conjunction with its quarterly status reports on the District of Columbia VM Work Plan.

Weak Species

Pepco targets trees for removal which are identified as weak species of trees, including:

- White Pine;
- Tulip Poplar;
- Red Maple;
- Silver Maple;
- Northern Red Oak;
- Virginia Pine; and
- Black Locust.

Removal of overhanging limbs

The VM program specifies the removal of limbs that overhang the mainline three phase distribution lines wherever possible. Overhanging limbs can cause a problem as they break and fall into the lines causing outages. Pepco targets overhangs in the wire zone, and proceeds to remove the overhanging limbs if Pepco has the rights to do so. Within the District of Columbia the Company must also comply with the special trimming and removal regulations for the elm trees that may be infected with Dutch Elm disease. This adds another level of complexity as these trees can only be trimmed during short periods of the year and any limbs removed require special disposal techniques.

3. Feeder Improvement

Annually, Pepco employs a three-step method for determining the group of feeders to be included in the feeder improvement program:

1. Identification of the poorest performing feeders pursuant to Commission standards (Previously this step used the CPI method. Beginning with the 2013 Priority Feeders, the System Performance Contribution (SPC) method described in Section 2.4.1.1 is used.);
2. Identification of the poorest performing feeders based on the CPI method. (Previously this step used feeder contribution to SAIFI); and
3. Identification of feeders serving customers that have experienced outages above a Pepco-determined threshold based on available program budget.

3.1 Priority Feeder Program

Each year Pepco reviews the performance of its distribution feeders. The feeders are ranked from the most to the least reliable according to several criteria over a rolling 12-month period from October 1 of each year through September 30 of the following year. A group of the least reliable feeders is selected for improvements over the ensuing calendar year. Detailed investigations are performed to determine the cause of outages and necessary corrective actions to reduce the number of outages.

Pepco develops a Priority Feeder list in compliance with Commission standards, which require mitigation efforts for the poorest performing 2% of its feeders.

In addition Pepco extends its list of feeders for improvement beyond the Commission-required 2% Priority Feeders. This allows for more detailed inspections, enables more aggressive and longer-term improvements, and provides more flexibility when determining corrective actions. Thus, the feeder improvement program not only captures a greater number of at risk feeders, but it entails a larger array of mitigation and preventive options that Pepco may deploy.

3.2 Ranking and Selection Criteria

Identification of the Priority Feeders – New/SPC Method and CPI Method

Pepco uses a blended performance ranking, known as the SPC method, based on an individual feeder's contribution to SAIFI and contribution to SAIDI to evaluate and rank feeder performance in order to identify the Priority Feeders needing improvement. The resulting index value is used to rank and identify the feeders that contribute the most to system reliability issues and therefore may require corrective measures to improve their future reliability.

Prior to 2013, Pepco used another ranking system known as CPI to determine worst performing feeders. Statistical analysis by Pepco indicated that the CPI methodology could be improved upon and simplified by replacing it with an alternative methodology, which ultimately yielded a better selection of Priority Feeders. This alternative methodology was presented to the Productivity Improvement Working Group (PIWG) in the Fall of 2012 along with the supporting analysis. The new blended performance methodology became the primary tool for selection of Priority Feeders. However, to address concerns including continuity of existing programs such as tracking of repeat Priority Feeders, Pepco has produced the Priority Feeder list using the new methodology as well as a CPI-Selected Feeder list using the historical CPI methodology. Pepco is performing remediation work on all feeders selected. This resulted in a total of 17 feeders selected, including 16 from the new Priority Feeder method and an additional one feeder identified by CPI. Pepco is working on the additional feeder selected by CPI under the REP Feeder Improvement program in lieu of the largest contributors to SAIFI.

Feeders with a High Number of Outages

The third tier of the Feeder Improvement list is composed of the feeders, or sections of a feeder, which serve customers who have experienced a high number of outages. The purpose of including these sections of feeders on the Feeder Improvement list is to target specific trouble areas that may affect relatively small number of customers but cause high levels of customer outages both during storms as well as during non-storm conditions. Also, feeders with devices that have experienced multiple operations over the course of a rolling 12-month period may be referred to the Feeder Improvement program for investigation and possible remediation.

Combined, these measures provide Pepco with a comprehensive view of the performance of its feeder assets. Once these feeders and locations are identified, three steps are involved from the completion of feeder selection to completed work:

- Field inspection and preliminary scope of work development;
- Detailed design defining the final scope of work, material to be upgraded or replaced; and
- Construction and inspection of work performed.

3.3 Remediation Process Going Forward

Pepco will continue to execute the Feeder Improvement program with the objective to address customer reliability issues. Selected feeders are assigned to engineers for analysis and evaluation in order to identify and design circuit reliability improvements. Pepco gathers and reviews system performance data on the selected feeders, checks for potential overloads and imbalances, and provides feeder maps and field inspection request forms to the designated field inspection crews.

Based on the field inspection results, the information is reviewed, evaluated and analyzed in order to recommend appropriate corrective actions. Remediation can be both tactical and strategic, and there is significant overlap of remediation options among the various REP initiatives.

Tactical Remediation Efforts

Proposed corrective actions may include, but are not limited to, the following activities:

- Installing animal guards;
- Replacing blown lightning arrestors,

- Replacing deteriorated poles/cross arms,
- Re-tensioning slack spans and installing spacers,
- Replacing deteriorated insulators,
- Replacing transformers and other distribution equipment based on observed condition,
- Installing of new lateral tap fuses,
- Installing sectionalizing devices,
- Performing VM work, including tree removals,
- Replacing missing or damaged grounds and guys,
- Checking for appropriate fuse installation and resizing fuses for fuse coordination in response to fuse inspection results,
- Installing tree wire in areas where vegetation cannot be effectively managed,
- Replacing underground cable in duct or direct buried cable,
- Re-routing overhead feeders to avoid potential fault sources, and
- Adding an automatic sectionalization and restoration scheme to a feeder.

Strategic Remediation Efforts

In cases where sufficient reliability improvement has not been obtained from past corrective actions and a feeder has repeated on the feeder improvement listing, Pepco will examine more extensive options for addressing performance.

3.4 Identifying and Tracking Specific Feeder Initiatives [34]

Feeder reliability improvements are typically achieved through the application of multiple initiatives or activities, such as the Tactical Remediation Efforts.

These activities are selected and applied based on several factors, including causes of historic outages as well as the observed condition of the feeder and presence of potential future fault sources or exposures including the age and condition of the equipment currently installed along the feeder. All of these initiatives are available to Pepco when determining how to address a selected feeder**.** As can be expected, there are times when multiple activities can address the same fault sources, such as re-tensioning slack spans and VM. As such, it would be impossible to isolate which activity would be directly responsible for the benefits achieved in order to accurately track feeder improvement costs within the REP by initiative.

Although there may be instances when a fault source is addressed by one specific activity, in which case it could be possible to track feeder improvement costs to that activity, the likelihood of this occurring throughout the year is rare, and the value of tracking so few instances would not warrant the effort and expense, or produce any statistically meaningful information.

[34] Order No. 16975 states the following at paragraphs 87, 91, 115 and 117:

87. *The "Feeder Improvement Program" is a part of the REP and, according to OPC, includes three initiatives: Priority Feeders, Poorest Performing Feeders Based on Contribution to SAIFI, and Feeders Experiencing Outages above a Pepco-determined Threshold. OPC suggests that the Work Order Number (Work Breakdown Structure element) be used to track individually the three initiatives. The Commission believes that OPC's recommendation has value; however, we do not read the REP work breakdown structure as containing three distinct feeder improvement initiatives as identified by OPC. Therefore, rather than adopting OPC's recommendation at this time, we shall require Pepco to identify specific feeder improvement initiatives, if any, in the 2013 Consolidated Report and report on the feasibility of tracking feeder improvement costs within the REP by initiative as recommended by OPC.*
97. *Decision: The Commission is concerned that, if this recommendation were applied to every feeder, as well as every initiative, the effort would be overly burdensome. As discussed above, it is not clear that Pepco has specific feeder "initiatives" as identified by OPC. Therefore, we direct Pepco to comment on OPC's recommendation in the 2013 Consolidated Report when it comments on the feasibility of tracking feeder improvement costs by initiative.*
115. *Pepco is DIRECTED to identify feeder improvement initiatives consistent with paragraph 87 herein;*
117. *Pepco is DIRECTED to comment on the feasibility of tracking reliability improvements by feeder and initiative consistent with paragraph 91 herein;*

Additionally, the measure and inclusion of cost/benefits per feeder or per individual initiative would potentially act to reduce the field of options available to apply in feeder performance improvement. Some activities will not be as efficient or economical as others mathematically. For example, the planned replacement of URD cables would always rank higher in cost than simply repairing a cable after a failure. This analysis would overlook the benefits of cable replacement and elimination of future cable failures. However, the potential exclusion of these activities based on their relative inefficiency at the feeder or activity level would mean that the best overall portfolio of remedies could not be used in system level improvement.

As such, Pepco agrees with the Commission's previous conclusions and believes that this requirement would not only be overly burdensome, but would potentially serve to exclude some currently used activities that exhibit lower cost benefit, but are nevertheless necessary to improve system performance.

As noted above, when multiple initiatives are used to address the same fault sources, it would be impossible to isolate which initiative would be directly responsible for benefits achieved, making it impossible to accurately track feeder improvement costs within the REP by initiative. Consequently, Pepco does not believe that it is practical or feasible for it to track feeder improvement costs by initiative on a feeder by feeder basis and that the better way to evaluate performance is to measure the reliability of groups of feeders where improvement initiatives have been performed. Comparison of system performance among different periods of time accurately identifies the benefits gained by the reliability work performed in total and not by individual activity.

4. Underground Residential Distribution (URD) Cable Replacement and Enhancement

Pepco began installing underground residential infrastructure in the 1960s. Within the District of Columbia, the use of URD cable was not implemented until new housing developments were developed that allowed space for the installation of direct buried cables outside of the road ROW. Much of this type of cable is installed in a conduit manhole system, which provides increased protection to the cables and access to replace individual sections of cables. Today, those older URD cables are reaching or have reached their end of useful life and will need to be replaced or enhanced. The need for this work will continue at varying levels into the future, as additional URD cable reaches the end of its useful life. If URD cable is not enhanced or replaced, there is a heightened risk of cable failure and outages. Due to the increase in the number of URD cable failures within the District of Columbia, an engineering strategy for a formal URD cable replacement program was implemented in 2012. This program, like all reliability programs, will be evaluated each year to determine the proper level of funding. This elevated level of effort would allow Pepco to transition its current URD cable strategy to one of proactive replacement and renewal.

In order to implement a planned URD cable replacement program, Pepco expanded its program to identify, analyze, and initiate corrective actions for the mitigation of URD cable failures as well as enhance the integrity of the URD system in terms of reliability, safety, and cost.

4.1 Background

Installation of Pepco's underground residential infrastructure started in the 1960s, and saw a rapid increase into the 1970s to comply with rules mandating the use of underground cable in new residential developments.

Although the cables installed were expected to have an average lifespan of 40 years or more, the factors influencing the performance of the cable and consequent issues were still being discovered at the time. For example, the types and purity of the materials used in the cable's semiconductor often resulted in early cable failures by compromising the capability of the semiconductor. These unforeseen issues have required innovative efforts to mitigate their impact and reduce reliability issues.

Initially, URD cables used an insulation material known as high molecular weight polyethylene (HMPE). In the mid-1970s, the insulation material was changed from HMPE to cross link polyethylene (XLPE) for new installations, which has proven to be more reliable. In the 1980s, Pepco replaced XLPE with an improved material, ethylene propylene rubber (EPR), which is the current material used for all new URD installations.

Pepco's URD cable replacement and enhancement program effort is focused on selected areas that have experienced cable failures, or where cable failures may be expected. The program has only a limited impact on system-wide measures of reliability. This is due to the small number of customers that are generally impacted when a cable failure occurs and the system design that allows the customers to be restored to service before repairing the failed cable. However, the program is important to reduce the number of customers and neighborhoods experiencing multiple interruptions due to aging URD cable, which generally occur during high load periods. Combined with other REP reliability efforts, this project will contribute to overall system reliability improvement and increase customer satisfaction in those communities.

4.2 Strategy

The URD cable system is analyzed regularly to determine priority subdivisions. Pepco then identifies feeders for replacement or enhancement, analyzes potential remediation options, and implements corrective actions. This work contributes to the mitigation of URD cable failures and maintains the integrity of the URD system, in terms of reliability, safety and cost.

This process involves the following components:

- Obtain URD outage history and determine number of failures within the subdivision, cause of the failure, number of customers, and location of the event;
- Acquire available information on age of the cable, type of cable, and design of the subdivision; and
- Use established criteria for URD cable replacement to determine priority areas.

4.2.1 Cable Replacement

There are two sub-categories to replacement work: spot primary replacement and subdivision primary replacement.

Spot Primary Replacement consists of segment replacement performed on primary feeders on which three or more failures have been experienced and/or deteriorated neutrals have been identified.

Subdivision Primary Replacement uses established criteria for scoring subdivisions to replace entire primary cables that have experienced three or more failures in the last 12 months. The primary candidates are compiled into a list of priority areas. In older subdivisions, feeders will also be reengineered to the current standards of achieving load balancing and loop feed design. Pepco uses a scoring methodology to prioritize subdivisions for cable replacement or cable refurbishment. The selection criteria include consideration of recent cable failure history, number of customers served, system design, cable design and cable vintage.

4.2.2 Cable Life Enhancement

There is also an option to inject silicone-based rehabilitation liquid into the cable to extend the life expectancy of the cable, sometimes referred to as “curing.” To perform a URD cable enhancement, the program requires the following characteristics to be met:

- At least 50% of the original full size neutral must be remaining;
- Should not have multiple splices (more than 2 per stretch); and
- Splices have to be able to allow curing (e.g., no taped slices).

4.2.3 Installation of Lightning Arresters

URD cable and its associated infrastructure must be protected from lightning that could cause further damage to cable and other underground assets on the line. Pepco is enhancing this protection scheme on its URD feeders/extensions so that existing installations meet new standards, based on the following criteria:

1. All silicon carbide arresters are being replaced with Metal-Oxide Varistor (MOV) arresters at the cable riser pole;
2. All cable/loop open points are inspected to verify that they have MOV arresters; and
3. All "midpoints," defined as "the transformer adjacent to the open point in each loop," are inspected to verify that they have MOV arresters.

4.2.3 URD Cable Replacement and Enhancement Progress

In 2014, Pepco replaced or enhanced 4.2 miles of URD cable, and the program replaced or enhanced a total of 91.3 miles in the District of Columbia.

5. Distribution Automation[35]

Pepco recognizes the benefits of deploying smart grid technology to improve infrastructure reliability, enhance customer experience, and provide enhanced interaction levels with the grid. In late 2009, Pepco was awarded a Department of Energy SGIG grant to match its smart grid spending. DA is one aspect of Pepco's comprehensive smart grid strategy. Pepco's DA approach involves installing advanced control systems, ultimately across the distribution system, to automatically identify and isolate faults in real time and promptly restore service to customers in the unaffected parts of the system. The goal of this DA strategy is to deploy technology that will enhance reliability by improving speed of isolation of trouble spots on the system, in coordination with automated restoration capability. Pepco's DA efforts include the following three elements:

[35]In Order No. 12804 paragraph 53 E, the Commission ordered the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

- Fault identification and isolation: DA can isolate critical pieces of the infrastructure to minimize customer impact in a fault area and/or allow for quicker restoration;
- Service restoration: DA can significantly reduce the duration of outages experienced by customers through automated isolation of faulted areas and restoration of customers unaffected by the fault; and
- System/Data management: DA can provide accurate and real-time information regarding the overall integrity of the distribution system, which allows for targeted deployment of corrective maintenance and upgrade measures for critical assets.

5.1 Selection and Prioritization

To identify the distribution feeders for inclusion in its ASR scheme, Pepco evaluates the lockout history of individual substation breakers, circuit breakers and downstream automatic circuit reclosers. Pepco prioritizes its plan considering factors such as reliability improvement, customer impact, and cost efficiency. Selection criteria for ASR deployment include:

- Identifying feeders with three or more lockouts over the most recent two year period;
- Identifying distribution feeders with tie points to other feeders that meet planning criteria; and
- Focusing efforts on 13 kV feeders, as they carry four to five times more load than 4 kV feeders.

Feeders are grouped into ASR schemes based on their proximity to other qualifying feeders. This grouping produces synergies by using the same substation equipment to control multiple feeders. Pepco prioritized this list of feeders by ranking them by number of lockouts over a two year period.

5.2 Integration of DA with Existing Systems

DA designs must integrate with existing or developing systems, such as the central operation systems (*e.g.,* EMS, OMS) and consider interfacing with other smart grid systems such as AMI or Direct Load Control devices. These and other key linkages need to be mapped and considered in all design plans.

The overall smart grid network and infrastructure design includes a fiber-optic/microwave network, a wireless broadband network, and a wireless mesh network. The wireless mesh network leverages the mesh network installed for the AMI system; additional radios are only installed at the DA device to communicate with the network.

The DA devices connect to the overall Pepco network through the wireless mesh network. Pepco has a signed short term contract with a public wireless provider to provide broadband services and is currently evaluating and testing longer-term solutions for a private broadband network. Pepco has constructed and continues to expand its fiber optic network, which is used for communications between substations, and between substations and the control centers.

6. Load Growth/4 kV Conversions

Pepco's load growth management program plays a significant role in both maintaining reliability and validating that future demand can be met under adverse conditions and during peak load conditions. Pepco uses PJM estimates, in addition to internal data, to calculate growth trends and produce a load growth forecast for its substations. Pepco's distribution and subtransmission networks have been designed with N-1 redundancy. The redundancy built into the system means that Pepco can lose one subtransmission line or substation transformer and still be able to serve peak load with the remaining facilities. Maintaining and improving this resiliency is critical to Pepco's total system reliability as well as the capability to effectively implement and accurately measure other REP initiatives.

Pepco has a process in place to effectively identify and relieve equipment overloads and system voltage violations through the planning process. Feeder and substation loads are monitored continuously through Pepco's SCADA system with system operators being alerted to substation operational abnormalities including feeder or transformer overloads.

6.1 Load Growth Forecasting

Planning for future load growth starts with the development of load growth projections. Short-term, summer-peak forecasts are developed for three years to allow adequate time to complete routine 4 kV and 13 kV construction work. Long range forecasting (four to ten years) is used to develop advance plans for large 4 kV and 13 kV construction projects that require more than two or three years to complete, to develop routine and advance plans for 34.5 kV to 230 kV construction work, and to identify future capital projects in the construction budget forecast process. Planning for upgrades to the transmission system is completed in conjunction with PJM using five- and ten-year load projections.

Distribution load growth in Pepco territories is studied by regions or areas. Substations within an area are studied to establish load growth on that substation and to determine the appropriate actions required to meet the system planning criteria. This load review determines an area and substation load growth trend based on data collected over several years. Information from area developers, demolition of existing facilities, and discussion with local officials are additional data sources that are used in developing individual feeder and substation forecasted loads. If load growth is extensive in a particular area, new load will be supplied from the existing 13 kV system infrastructure due to capacity limitations associated with the 4 kV system. Distribution load growth studied within an area is based on the load factors, historical trends, and AMI data that were established for that area.

Network load growth in underground network areas is studied in a similar fashion to other types of load on the system. Trends are developed from historical load information over the past several years. When load growth is projected to cause a particular network system to exceed the group capacity or individual feeder capacity, load transfers to other area networks are examined. In designing network transfers, the available capacity of the substation, load distribution on network feeders or spot networks are studied to determine, based on geographical considerations, the available load that can be transferred to the other network. Secondary networks associated with the load to be transferred must be examined to validate that adequate capacity and appropriate secondary cable systems exist and that no secondary cable ties are maintained between the networks. Design criteria associated with the operation of the network must also be examined for proper separation of one network from another. Load flow studies are conducted biennially (addressing approximately half of the system each year) to confirm adequate capacity of cables and transformers.

6.2 Load Management and Customer Density

Reliable electric system design requires a thorough understanding of load growth trends. Whenever substantial new loads are added or systems are reconfigured to incorporate new services, Pepco follows engineering design and planning practice to model the addition of new load to determine its impact on the system.

Pepco uses power flow and GIS systems to model system loading in an effort to predict and identify overload situations and to develop recommendations for their mitigation, so that single contingencies (i.e., loss of a substation power transformer and/or its associated supply feeder) will not overload the system. A comprehensive engineering process exists for gathering data, developing model inputs, and correcting any load violations generated. This process also includes updating any new loads and system modifications in the model so that the latest system configuration is reflected both presently and up to ten years forward for transmission planning.

2015 Work Plan [36]

The tables provided in Attachment A reflect the required capital budget and spending information for REP and Non-REP reliability improvement projects, as well as the 2015 REP work plan organized by REP project categories.

These tables contain identifying information for each District of Columbia project organized by their project category as set forth in the REP: (1) VM; (2) Feeder Improvements; (3) URD Cable Replacement and Enhancement; (4) DA; and (5) Load Growth/Conversions.

The identifying information for each of the projects includes:

1. The location and subdivision for each project;
2. The Feeder ID;
3. The Work Breakdown Structure (WBS) number, which is the number that the Company uses for the organization of projects for budgeting and scheduling purposes; and
4. The quarter in which the Company expects the project to be complete and providing service to its District of Columbia customers.

[36] Order No. 16975 states the following at paragraphs 48 and 100:

48. *Decision: The Commission concurs with the position taken by Staff and OPC that it is critical to understand the difference between Pepco's Reliability Enhancement Plan and its normal, on-going reliability improvement projects in the District. Pepco's response fails to provide the necessary clarity on whether the REP is in lieu of or in addition to on-going reliability projects. The Commission therefore requires Pepco to include in future years' Consolidated Reports a clear statement as to which elements of the REP are separate from the Company's normal, on-going reliability improvement projects. In particular, we direct Pepco to respond to the issue raised by OPC about the appropriateness of including load growth projects as reliability enhancement projects in the Reliability Enhancement Plan. We further direct Pepco to identify the amounts budgeted for the elements of the REP for the years 2010 through 2013. We also direct Pepco to identify the amounts budgeted for non-REP reliability improvement projects, specifically including and identifying load growth projects, for those years. We believe this information is necessary and useful in conducting a year by year comparison of the elements of the REP with non-REP reliability improvement projects and to better distinguish between the projects and we direct Pepco to file this information in all future Consolidated Reports.*

100. *Pepco is DIRECTED to provide information on the Reliability Enhancement Plan consistent with paragraph 48 herein;*

Order No. 16975 states at paragraph 48:

> *"The Commission therefore requires Pepco to include in future years' Consolidated Reports a clear statement as to which elements of the REP are separate from the Company's normal, on-going reliability improvement projects."*

In response, Pepco notes that the work performed under the REP is not new to Pepco. Pepco continues to implement the projects within its work plan aimed at producing reliability improvements over a shorter period of time. In addition, Pepco's construction work plan is not static: it is continuously being reviewed, and appropriate changes are made to meet changing operating conditions. However, the type of work being performed does not change. The changes are to the locations where work is needed and the timing of completion of work.

The budgeted amounts and timing of completion reported below reflect the Company's estimate of the cost of each project and a consideration of the Company's ability to expedite higher priority projects to attain reliability improvements necessary to comply with EQSS reliability standards. Estimates are necessarily revised at the time the work is issued to construction based on field investigation and engineering surveys. The actual cost and timing reported reflect the final cost and time necessary to perform the work, and may vary from the project estimates due to permit restrictions, changes in scope of work during construction, or identification of unexpected obstructions that impact the ability to construct the new facilities as originally anticipated. However, the Company works to not exceed the total budgeted levels and estimated completion dates on any individual project. The Company strives to install the new facilities in the most efficient manner possible taking into consideration the variables associated with any construction project.

Order No. 16975 states the following at paragraphs 47 and 48:

> *47. Further, OPC believes that inclusion of load growth projects in the Reliability Enhancement Plan is incorrect and misleading. According to OPC, planning for growth and the need for adding capacity are an integral part of being an electric utility, not "reliability enhancement."…*
>
> *48. Decision: …In particular, we direct Pepco to respond to the issue raised by OPC about the appropriateness of including load growth projects as reliability enhancement projects in the Reliability Enhancement Plan.*

Load growth projects, also known as system improvement projects, are appropriately included in the REP because the goal of load growth projects is to ensure the electric system has adequate capacity to reliably supply existing demand and future load growth. As discussed in the Company's comprehensive reliability plan filed in September 2010 (REP), the three major components of system planning are:

1. Voltage and Reactive Support
2. Ratings of Facilities
3. Reliability

The voltage and reactive support criterion ensures that proper voltage levels are maintained throughout the electric system for overall reliability of service. Failure to maintain proper voltage levels could potentially cause customer's equipment to trip or go offline, in effect resulting in an outage to that customer.

The ratings-of-facilities criterion ensures that the equipment on the electric system does not exceed its operating ratings. Operating levels exceeding ratings will shorten the life expectancy and therefore the reliability of the equipment (transformers, substation breakers, conductors, etc.). The equipment will fail more quickly, which can cause an outage.

The reliability criterion ensures that each Pepco substation in the District of Columbia has sufficient capacity so that any one component (e.g., a substation transformer and/or its associated supply feeder) can be out of service without suffering loss of customer load or overloading any remaining equipment. In addition, the radial distribution system is designed so that under peak load conditions any feeder can be backed up through manual switching operations at the substation. Failure to implement the reliability criterion will increase the frequency and duration of outages in the event of equipment failure.

Failure to address the three major criteria will result in power quality issues or shorten equipment life, which ultimately will result in an outage, harming Pepco's overall service reliability.

Work Plan Tables

The tables included as Attachment A align the elements of the REP with a detailed presentation of the various projects required to complete this plan, along with schedules, work status, budgets, and for previous periods, actual spending. The work plan presented outlines the work to be performed during 2015. It should be recognized that many projects have multi-year durations and therefore may have started in 2014 (or earlier) and will be completed in 2015 or may start in 2015 but will not complete until 2016 or later.

Note, in its response to Staff's comments on the 2013 Consolidated Report, Pepco indicated that it will specifically identify those substation reliability projects that are a direct result of Pepco's ECA program.[37] These projects are indicated with an * symbol.

37 Pepco's Response to the "Staff Report on the Potomac Electric Power Company's 2013 Consolidated Report: Productivity Improvement Plan, Comprehensive Plan, Manhole Event Report," filed August 14, 2013, at 2.

REP PERFORMANCE METRICS

1. Performance Measures

Pepco will measure the progress of its reliability improvement through a number of different metrics. Pepco's District of Columbia annual system-wide SAIDI and SAIFI will continue to be tracked and reported in accordance with the Commission's EQSS requirements, including the revised standards for 2013-2020. In addition, the REP initiatives will be tracked by physical measures, such as miles of feeders on which VM has been performed and number of ASR systems installed. Finally, Pepco has developed metrics applicable specifically to the REP initiatives to provide insight on the contribution of the elements of the REP to enhanced reliability as described herein.

The table below summarizes the REP initiatives and the specific metrics to be applied to the initiatives. The remaining portion of this Exhibit describes the Company's measurement methods and applies them to the REP initiatives, with a comparison of 2014 results to the 2010 baseline.

Initiative	Description	Metrics
Feeder Improvement	Program to address equipment, vegetation, weather, and animal-related interruptions which negatively impact reliability performance. These projects involve installing, removing, and replacing reclosers, switches, conductors, animal guards, lightning arresters and other equipment deemed necessary on the worst performing, top SAIFI contributing, and high customer interruption feeders to maintain safe operation and improve reliability.	Annual cumulative SAIFI/SAIDI performance for all feeders included within the feeder improvement as well as feeders where DA has been installed and feeders are undergrounded.
DA	Program to address system reliability by deploying technology. These projects involve installing advanced control systems across the distribution system in order to automatically identify and isolate faults in real time and restore service to customers in the unaffected parts of the system.	
VM	Program to address vegetation, designed to maintain appropriate clearance on the system, remediate trouble spots (e.g., Priority Feeders), and remove the vegetation hazards that have the greatest impact on system reliability.	Annual tree related SAIFI/SAIDI performance for all feeders.
URD Cable Replacement and Enhancement	Program to address reliability of the underground residential infrastructure. These projects involve replacing or rejuvenating URD cable in order to minimize URD failures.	Annual number of URD cable failures.
Conversions	Program to upgrade aging 4 kV infrastructure to 13 kV and retire 4 kV substations.	Amount of load converted.
Load Growth	Program to address increasing load demands to maintain reliability and to ensure that future demands can be met under adverse conditions. These projects involve adding or upgrading feeders in order to reliably supply new customers and support increased usage required by existing customers.	Operate substations within design loading criteria.

2. Reporting Process

Previously, because 2010 was the year the REP was implemented, Pepco used 2010 as the base year on which to track REP performance. However, given the notable reliability improvement reflected in every REP metric, the Company will begin reporting the reliability metrics on a rolling five-year basis. The five-year rolling reporting will allow the following charts to better reflect the trends of the data. The Company will continue to track progress on each REP initiative using the metrics described herein. Due to weather and other variables, including the timing of completion of projects throughout the plan year, the metrics produced by the REP initiatives in any one quarter or year may not necessarily reflect the actual reliability improvement generated by the initiatives individually or in total. Furthermore, the sum contribution of the improvements included in the REP may not equal the system wide reliability measures (and may show greater or lesser gains in reliability). This difference may be due to the many variables that affect the electric distribution system, the fact that the various REP metrics are measuring only subsets of the entire system, different physical components than the system wide measurements, and because the REP metrics are based on different factors than the District of Columbia system wide reliability measures. As further experience is gained with the metrics specific to the REP initiatives described herein, Pepco may present revised metrics or applications, while keeping in mind the desirability of maintaining data that can be usefully tracked over time to the greatest extent reasonably possible.

3. Feeder Improvement and DA

Pepco will track the cumulative SAIFI and SAIDI for (a) all feeders included in the feeder improvement program, and (b) all feeders that have had DA installed. This metric will be measured on an annual basis and improvement will be shown on a rolling five-year basis. These initiatives are grouped in a common measurement tool because multiple enhancement techniques are typically combined on a single feeder to achieve the desired outcome and are not readily measured in isolation.

Charts 1A-D below illustrate the reliability based progress achieved between 2010 and 2014 relative to feeder improvement and DA (with no feeder undergrounding yet undertaken). Data is measured excluding major event days (MED) determined in accordance with the IEEE Std™

1366-2003 IEEE Guide for Electric Power Distribution Reliability Indices because this data reflects operations under design or "normal" conditions, and so provides the measure of conditions which are susceptible to control by the utility.

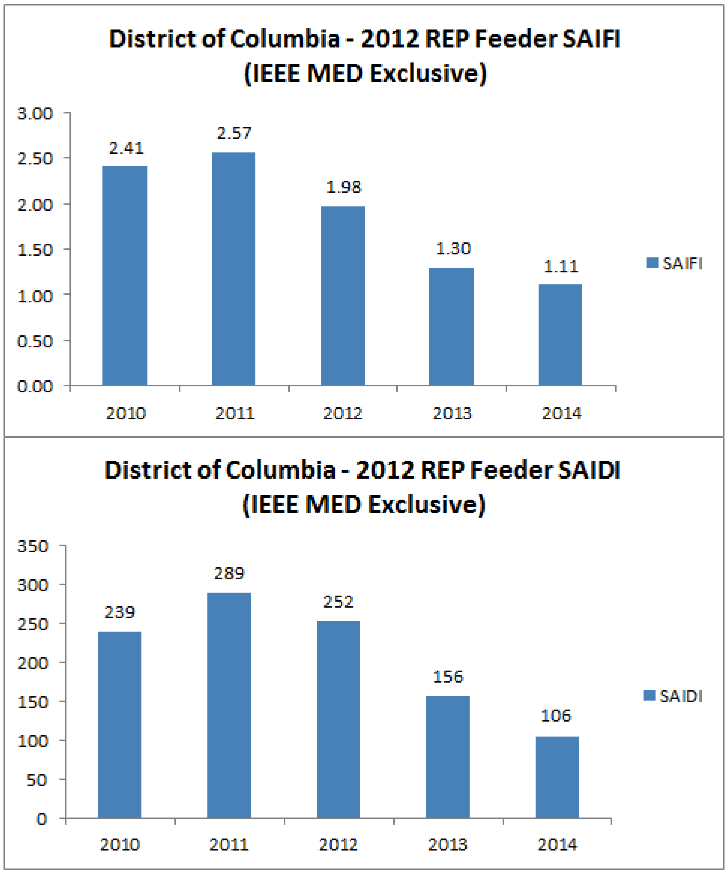
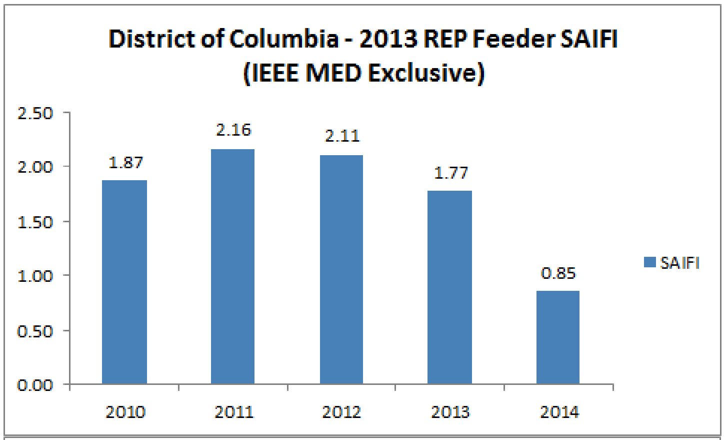
Chart 1-B



2012 REP Feeders

Chart 1-C

2013 REP Feeders



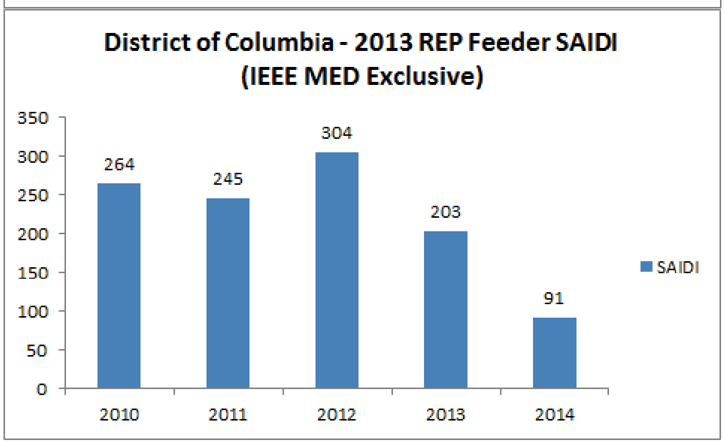


Chart 1-D

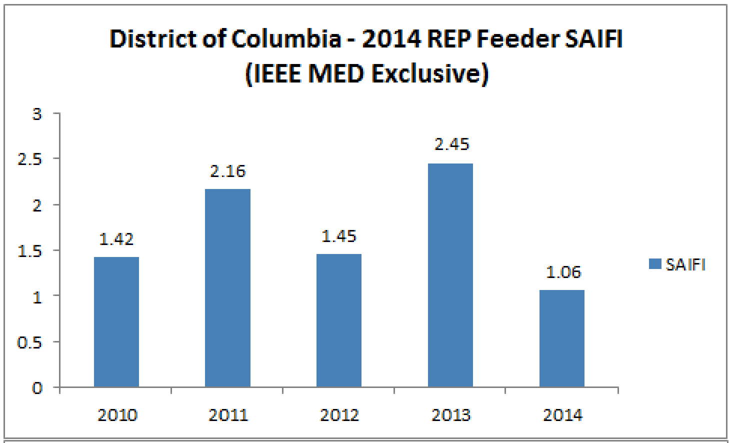
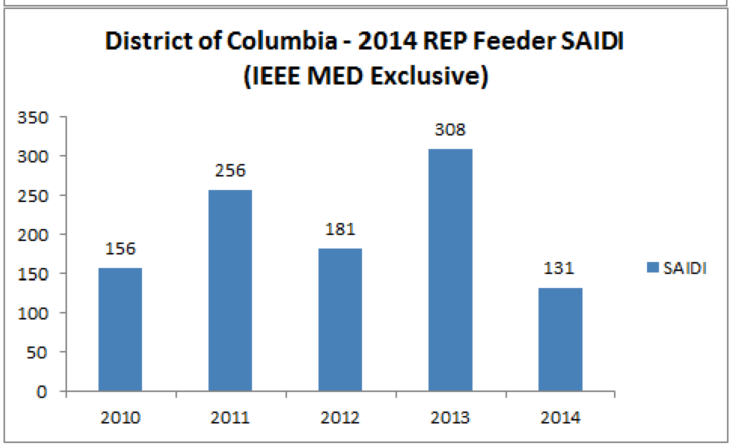


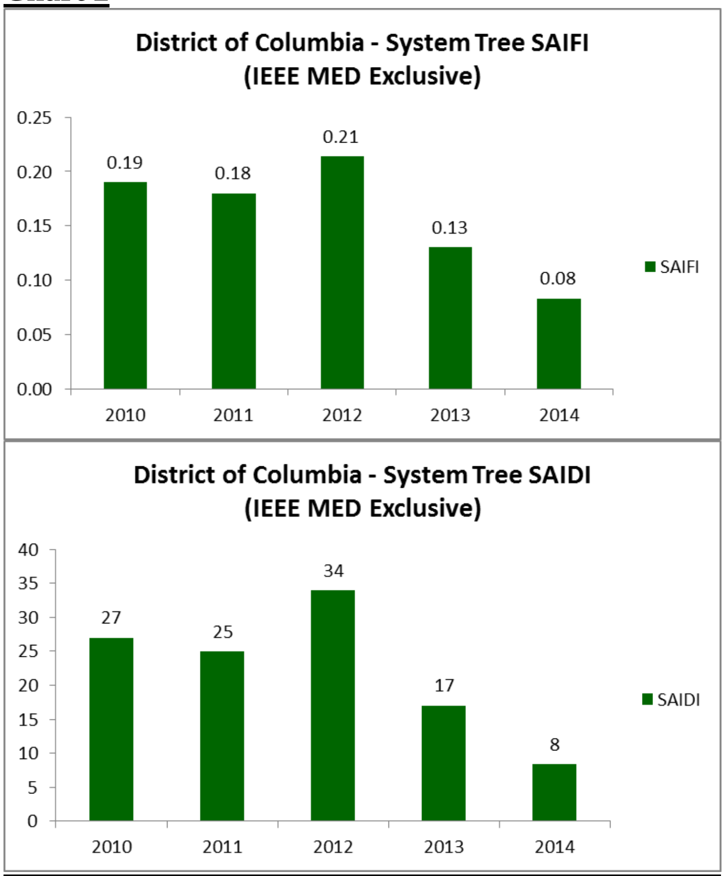


2014 REP Feeders

4. VM

Pepco uses District of Columbia system tree SAIFI and SAIDI to measure the progress of VM. Tree SAIFI and SAIDI measures the level of vegetation-caused outages on the affected feeders. This metric is reported on an annual basis as recorded within Pepco's OMS. This measure is shown on an MED-on an MED exclusive basis.

Chart 2



5. URD Cable Replacement

Pepco monitors URD cable performance through tracking and recording the number of URD cable failures. Due to the increase in the number of URD cable failures within the District of Columbia, an engineering strategy for a formal planned cable replacement program was implemented in 2012. Progress is measured by identifying the number of annual URD cable faults on a system basis. URD cable faults make a relatively small contribution to system wide SAIFI and SAIDI, but are a recurring factor in customer satisfaction with respect to reliability for the customers that are experiencing repeated outages due to failing cable, particularly due to "blue sky" failures.

Chart 3 provides a comparison of 2010 through 2014 URD cable failures.

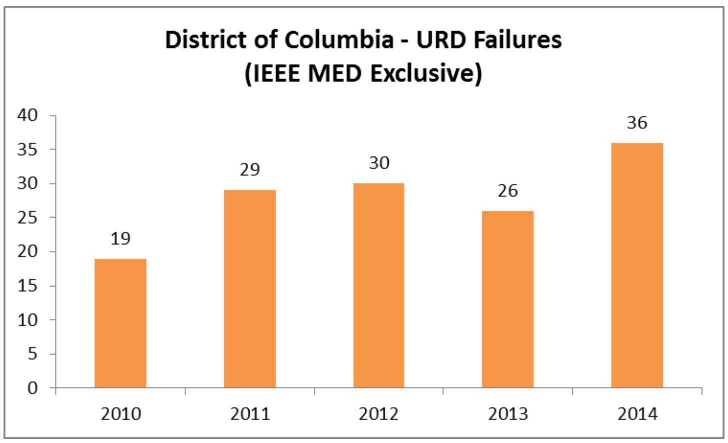


Chart 3

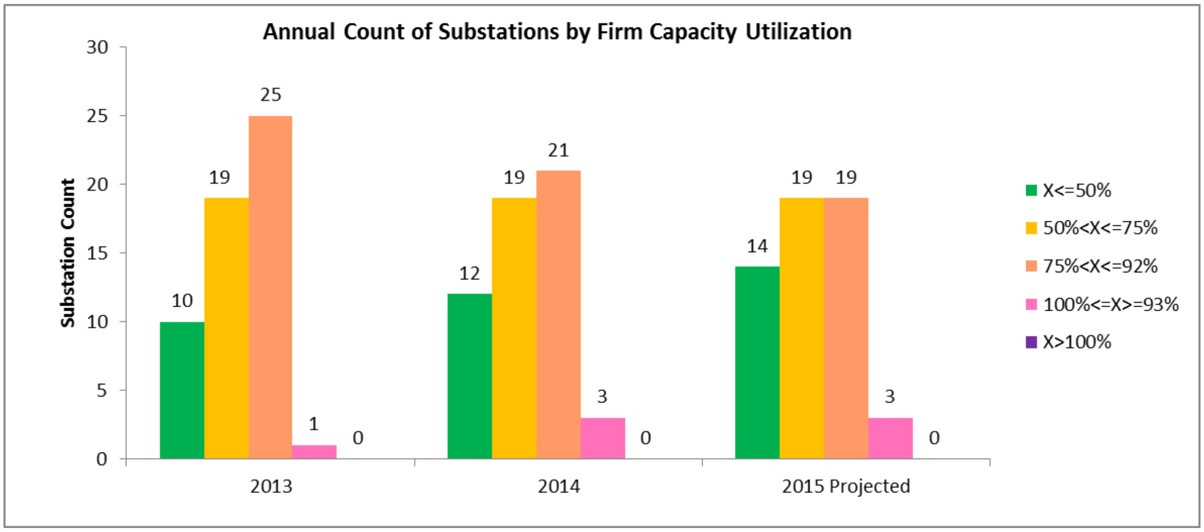
6. Load Growth

Pepco's system planning process is designed to meet customer load growth and to maintain the required ability to transfer load and maintain continuity of service under various operating conditions, including but not limited to operating conditions that warrant transfer of load between feeders and/or substations due to abnormal circumstances commonly referred to as N-1, a description of redundancy. Pepco monitors and measures success of its load growth planning efforts by maintaining normal loading limits established under system design criteria. Performance levels for this metric is based on annual reporting of overall substation conformity with normal loading criteria. Load growth projects do not lend themselves to ready measurement by metrics such as SAIDI and SAIFI. Instead, load growth is measured at the substation level by percentage of firm capacity used. Firm capacity is a design criterion that allows a substation to supply the full load of all the customers supplied from that station when one supply line to that station is out of service and includes within in it a margin of error to allow for planned and unplanned conditions. Thus, during normal conditions, a substation operated at a capacity above 100% does not necessarily represent a reliability threat but does indicate the need for analysis and planning to address the condition. Unlike other reliability measures, which are difficult to forecast with any precision due to the large number of variables (e.g., weather, dig-ins, vehicle accidents, animal damage), it is more feasible to forecast substation capacity usage since the variables are relatively stable and predictable (e.g., substation capacity and load growth). In addition, substation additions are longer-term projects that require several years of planning and construction; therefore, decisions to construct new substations must be made well in advance of the actual need and require decisions to be made on forecasted load and not actual load conditions.

Chart 4 provides a comparison of 2013 substation firm capacity usage to 2014 substation firm capacity usage and a forecast of 2015 for this measure.

Chart 4



Note: 2013-2014 substation loads from analyzed historical peak loadings.
2015 predicted substation loads based on 2014 peak historical substation loadings.

7. Forecasting Model for System Wide District of Columbia Reliability Performance

Pepco employs a statistical modeling program to project and evaluate the expected reliability performance of the electric system based on the impacts of the REP. Specifically, this model provides a probabilistic range of estimated SAIFI and SAIDI improvement values for the District of Columbia as a function of carrying out the elements of the REP.

The model is based on forecasted reliability improvement from three components of the REP: VM, feeder improvement work, and DA implementation. The balance of the REP project categories are expected to contribute to additional improvements in reliability performance. However, Pepco will update this model as actual data becomes available.

The forecasted results are illustrated in Chart 5 (SAIFI) and Chart 6 (SAIDI) below.

Chart 5

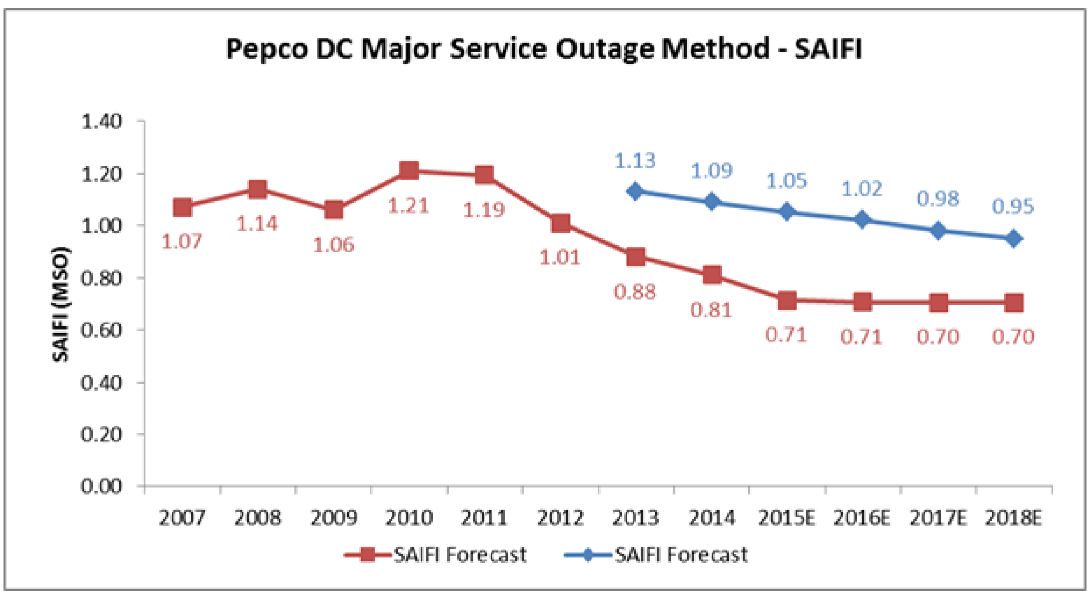


Chart 6

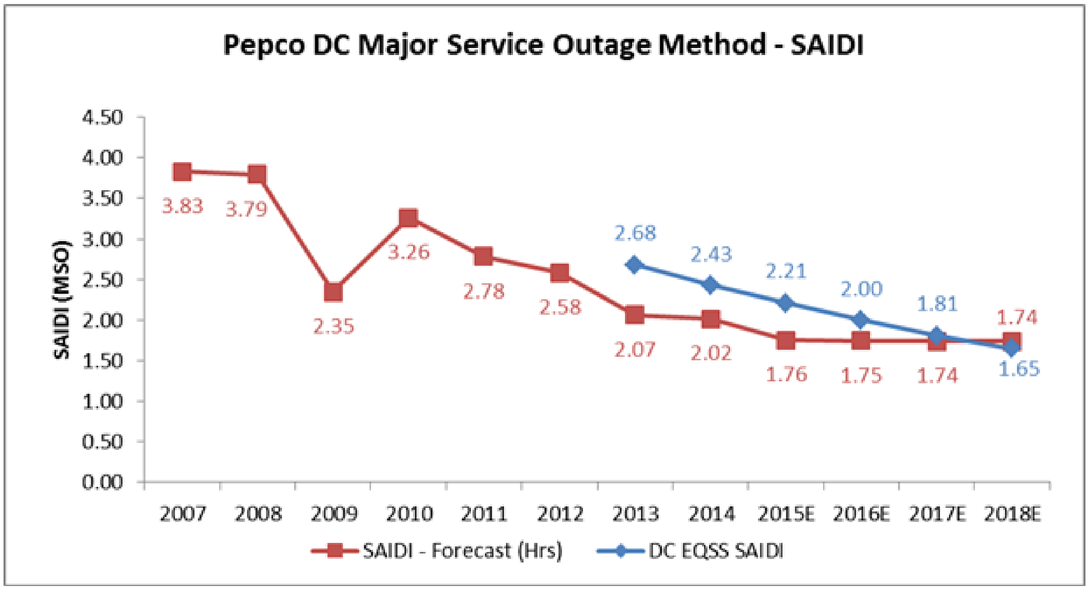


1.3.7 STORM READINESS

Pepco's mandate is to provide safe and reliable electric service. This is the basis for all Company contingency operations, including storm restoration, and is the foundation for the Storm Restoration Objective of safely restoring electric service to the greatest number of customers in a minimum amount of time. The Pepco District of Columbia Major Service Outage Restoration Plan (MSO Plan) uses these principles to assess damage across the entire Pepco service area and to establish restoration guidelines for preparedness, pre-storm planning, storm response, communications, and post-storm evaluations.

The PHI Crisis Management Plan and the MSO Plan necessarily modifies the normal corporate organization, in accordance with the National Incident Management System's (NIMS) Incident Command System structure, and manages this amended structure to accomplish storm restoration and emergency response. The Pepco Regional Incident Management Team (IMT) assigns personnel to this temporary structure to efficiently restore customer service. The overall governing principle of the Pepco IMT is to match resources to restoration requirements. The Pepco IMT is flexible in order to adjust resources to the various types of restoration efforts that may be required and to enable restoration activities to be prioritized to restore the largest number of customers first across Pepco's service territory. All Company resources, including Operations, Logistics, Planning &Analysis, and Finance and Administration are dedicated to customer service and the storm restoration effort.

Each branch of the Pepco IMT has the ability to expand or contract staffing for the response effort as necessary. Storm positions are activated based on the support or response functions required for efficient restoration. Pre-established storm duties are maintained for each storm position. The Staging Area branch of the IMT is activated under unique circumstances. The increased number of customer calls during storms requires additional staffing at the Customer Operations Call Center to answer customer inquiries and to supplement the automated entry of customer outage information. In the event of a major storm, Pepco's High-Volume Call Answering (HVCA) System can be activated to take the high volume of outage calls Pepco expects in the immediate aftermath of a major storm. This HVCA system is capable of answering more than 100,000 calls per hour to reduce the incidence of busy signals and hold times, and is most efficient in the early stage of the restoration process. Once the initial outage reports are in, the Company disables the automated call system and staffs the Pepco call center with additional employees who are trained to assist call center representatives in handling the increased volume of calls. All areas in the Customer Care Group, in performing their second roles are required to provide support to the Call Center. Additional personnel across the Company provide assistance through their incident response role assignments and help to relay accurate information between customers and operations.

Communication requirements for internal as well as external groups are identified in advance, planned for, and monitored for effectiveness during storm response. Accurate, timely and coordinated communications provide a vital link in the restoration response. Approximately 48 hours in advance of a significant major storm with predicted multi-day outages, Pepco notifies customers who are enrolled in Pepco's Emergency Medical Equipment Notification Program so they can prepare to implement their contingency plans in the event of power outages. Pepco also notifies regulatory and government officials and emergency management agencies of its storm preparations and to discuss any special concerns. Operational communications coordinate field restoration activities. Communication roles in the PHI Crisis Management Plan and the MSO Plan provide for a proactive and flexible communication strategy.

The Storm Restoration Objectives are to safely restore electric service to the largest number of customers in a minimum amount of time. This requires advance planning and pre-storm preparation. Advance planning during non-storm conditions enables operational readiness for restoration activities. In addition to drills and exercises designed to lead employees through a variety of emergency scenarios, Pepco also works with local emergency management agencies and a cross-section of community, government and business leaders in a collaborative effort to review restoration plans and practices to develop more effective ways to improve Pepco's response.

In addition, Pepco actively pursues a public education and awareness campaign that includes initiatives such as the "Weathering the Storm" brochure, available in English and Spanish, and a series of fact sheets based on the brochure that are available in English, Spanish, Russian, Italian, Chinese, Korean and Vietnamese. These publications and additional brochures contain information about the Company's Emergency Medical Equipment Notification Program, tree trimming, and portable generator safety, all of which are available upon request as well as on Pepco's Web site. A series of videos including "What to do if the Lights Go Out", "How Power is Restored", and "Tree Management" are available through the Web site or upon request. These materials and information provided in Pepco's monthly newsletter that is mailed to customers with their bill provide information that help families and individuals prepare in advance for any emergency situation and are a significant component of Pepco's advance planning efforts. Additional preparedness information, as well as neighborhood outage maps, with information regarding each outage event, including the ETR, is also available on the Pepco web site.

Pre-storm preparation is the process of preparing for mobilization before a storm occurs. When a significant major storm threatens, Pepco begins preparations, when possible, by reviewing Pepco's inventory of storm repair materials and notifying vendors of the potential need for material procurement. To plan for sufficient staffing, Pepco informs employees of the pending storm and the potential for activation of their incident response second role assignments. The Company also alerts Pepco contractors and discuss plans for possible aid from the utilities within Pepco's participating mutual assistance groups. Both advance planning and pre-storm preparation activities enable a state of preparedness to transition smoothly to IMT operations and to minimize restoration time.

After a storm affects the electric system, assessment and restoration begins. Damage Assessment requires an on-going evaluation of the substations shut down, distribution feeders locked out, and feeders with damaged segments, as well as the areas and the number of customers affected. This continual process enables efficient and appropriate allocation of restoration resources. The IMT is activated to provide customer communications and to coordinate the mobilization of crews for system repairs. Since damage assessment is on-going and storm levels may change in intensity, the restoration strategy may be modified throughout the effort, and the level of mobilization may be adjusted to meet restoration requirements.

Adequate supplies of materials, tools, and equipment are necessary for restoration to proceed safely and efficiently. Logistics include procuring, maintaining, and transporting restoration resources, personnel and materials. Departments are responsible for determining logistics requirements on an on-going basis and maintaining procedures.

When major reconstruction work or significant outside resources is required for system restoration, a staging area may be established. Staging Areas are defined as sites where crews and materials are temporarily stationed in severely damaged areas of the service territory. Staging areas are set up to respond to specific restoration efforts with assigned crews and on-site materials. Sites are selected for their accessibility, parking, and space to store materials needed for reconstruction and restoration of customer service.

During major outage events of extended duration Pepco can use resources from other PHI companies, if available, or request mutual assistance from one of several regional and national mutual assistance groups in which it participates. These groups meet periodically to review policies, procedures and work practices to ensure continued ability to provide mutual assistance between electric utility companies. Post-event evaluations following major service outages contribute to continuous improvements to the Pepco District of Columbia Major Service Outage Restoration Plan. Response activities are most likely to improve when recommendations are linked and incorporated into the plan and departmental support procedures. These links serve as the vehicle to enhance response plan capability. Trained personnel are essential for successful execution of storm response duties. Additional training requirements may be highlighted as a result of debriefings or drills.

Further, during major outage events, Pepco uses its Automated Metering Infrastructure (AMI) to enhance storm restoration efforts. For example, during Hurricane Sandy, 1,092 events were removed from the restoration queue by using AMI's capability to "ping" meters to help determine whether a customer has electric service. This application of Pepco's AMI network contributes to reducing restoration times, and avoiding costs, without necessitating phone calls to customers and it also materially reduces the number of truck rolls needed to verify customer restoration, helping ensure that crews are dispatched efficiently.

Drills and Functional Exercises

In 2014, Pepco participated and conducted multiple drills and exercises.

Pepco Emergency Management held a “Preparedness Tabletop Exercise” on December 17, 2014 with Emergency Management Agency (EMA) Directors and their key staff to review the year’s, procedures, available tools and coordination between Pepco and the Local EMAs. In addition, in 2014 the Pepco Emergency Preparedness worked with DC HSEMA and HHS staff to review the list of all critical facilities in the District. The critical facility lists are compared for accuracy on an annual basis to ensure both the Pepco and DC HSEMA have the necessary information to correctly, address and prioritize these critical facilities during major events. The Pepco IMT and CIC also conducted quarterly leadership meetings to review recent events and areas for process improvement. A drill of Pepco’s Emergency Satellite Communications equipment was conducted at the Pepco Benning Service Center on May 8, 2014.

Furthermore, in 2014 Pepco participated in external exercises, drills and seminars by providing subject matter expertise. Pepco participated in the District Hurricane Functional Exercise attended the District Response Plan Development: ESF #14-Damage Assessment meetings, the DC Water and Energy Nexus Review Meetings, the DC Infrastructure and Lifeline Systems Recovery Discussions, was part of the DC Hurricane Exercise Planning Team, the Council of Governments (COG) Winter Weather Briefing Exercise, and the COG Emergency Preparedness Council meeting. Pepco’s Emergency Management and Government Affairs teams facilitated a meeting with the D.C. AARP and key nursing home groups to discuss restoration priorities. These exercises, drills, seminars, meetings and task force included many District of Columbia stakeholders and key agencies

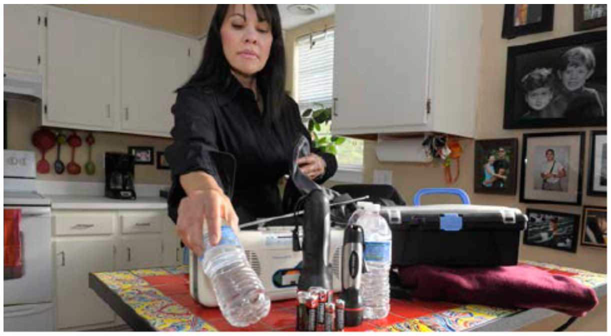
Pepco’s Emergency Management, Safety, Substation, and Underground Departments played key roles in the planning, security and activities for the African Leaders Summit as well as The State of the Union Address. Pepco was a contributor to the development of many of these forums as well as a participant.

Pepco actively participates in the District of Columbia Local Emergency Planning Council. Additionally, an Emergency Management Meeting for Key Accounts and government agencies was conducted on June 25, 2014 covering topics including emergency preparedness, restoration process, communications and coordination.

In conjunction with the MSO Plan, Pepco may also activate PHI's Crisis Management Plan. PHI's Crisis Management Plan defines the management structure and outlines response activities for extensive emergencies, including unplanned events that can cause significant injuries to employees, customers or the public; cause physical, environmental or technological damage; or that can shut down the business or disrupt operations. This plan also provides general guidelines allowing PHI and Pepco sufficient flexibility to respond to any emergency condition promptly and effectively.

LINES: Storm Preparation

Pepco is committed to achieving high quality communications with customers related to storms and power restoration. The Company's quarterly LINES publication provides information to customers regarding this topic. A clip from the Winter 2014 newsletter containing storm preparation communications is included below.



Winter storms are more frequent in a changing world and restoring power safely takes time. Here's how you can prepare so you'll stay safe and connected when severe weather strikes.

Before a Storm Strikes

- Assemble an emergency storm kit containing bottled water, non-perishable foods, blankets, flashlights and extra batteries, first-aid kit and prescription medications, special medical or infant supplies, hand tools and other essential items
- Purchase a battery-powered carbon monoxide detector for your home if you plan to use an alternative source of heat
- Develop and practice an emergency plan with everyone in your household
- Fill your bathtub with water if your water supply depends on electricity
- Make sure cell phones are charged
- Protect and unplug electronic equipment
- Ensure your Pepco contact information is up to date by calling 202-833-7500
- Download our mobile app (pepco.com/mobileapp) so you can get the latest news, report outages, access outage maps of your area, get restoration estimates and call us through a direct dial link should the power go out

If Power Goes Out

- If possible, gather in a central room that has an alternative source of heat such as a fireplace or wood stove
- Keep refrigerator and freezer doors shut
- Let the sun warm rooms during the day and close shades or curtains at night to keep warmth in
- Dress in loose layers for warmth and flexibility
- If using a portable generator during a power outage, always operate it outside and away from doors and windows to prevent deadly carbon monoxide fumes from entering the home
- If the indoor temperature drops to 55 degrees Fahrenheit or below, open your faucets slightly so they constantly drip to prevent pipes from freezing
- When conditions are safe, check on elderly or home-bound neighbors

Heating Without Power – Dos and Don'ts

- DO keep children and pets away from any open flames
- DO use a carbon monoxide detector to keep you and your family safe – carbon monoxide is not only colorless and odorless, it is deadly
- DO use sleeping bags and other cold weather gear to stay warm
- DON'T use a gas range for heating a room
- DON'T use a generator indoors or in any area without proper ventilation
- DON'T use charcoal to heat or cook indoors

For other tips and information, visit pepco.com/storm.

PART 2: 2014 PIP

SECTION 2.1 – REQUIREMENTS

On November 1, 1982, in Order No. 7668, the Commission adopted final rules regarding the submission of an annual PIP in Formal Case No. 766. These rules are codified in Title 15 of the District of Columbia Municipal Regulations, Chapter 5, Rules 502.1 and 502.2. In 1982 the Commission also directed the Company to establish the PIWG, consisting of representatives from the Commission Staff, the Office of the People's Counsel (OPC), and Pepco to provide a setting for communication among all parties and Commission Staff during the developmental stage of the first annual PIP. With the divestiture or transfer to an affiliate of all of Pepco's generating stations, the primary focus of the PIP and PIWG has shifted instead to transmission and distribution operations, performance, and reliability.[38] Later, Order No. 16623 emphasized a focus on reliability for the Consolidated Report.

SECTION 2.2 – PIWG

As discussed above, the PIWG has evolved over the years since its establishment, but continues to serve as a standing committee for collaboration among the Commission Staff, the OPC, and Pepco. The PIWG meetings address issues of interest to the Commission or PIWG members. Agendas and meeting frequency are determined according to issues of immediate concern to PIWG members and according to directives of the Commission. The PIWG generally meets no more frequently than monthly, but at least once per quarter. A discussion of the items on the next meeting's agenda usually occurs at the end of each

[38] In Order No. 15152 on the 2008 Consolidated Report paragraphs 68 the Commission stated the following:

> *68. The Productivity Improvement Working Group, which includes OPC, provided a reasonable definition of a productivity improvement project in 2006. Specifically, the PIWG states:*
>
> > *T&D productivity improvement projects were considered those projects that will increase T&D system efficiency by reducing losses and improve[ing] system reliability, and which may defer more costly additions to the electric system. (Footnote: F.C. No. 766, Decision on Consideration of OPC's T&D Productivity Improvement Working Group in Response to Commission Order No. 13754, filed July 6, 2006 ("2006 PIWG Report"), at 2.)*
>
> *The power serving the District's Standard Offer Service customers is now procured through a wholesale procurement process by PEPCO and, as such, productivity improvement is applicable only to transmission and distribution issues. We find the PIWG's definition of a productivity improvement project workable and adopt it here.*

PIWG meeting. The agenda for the next meeting is also included in meeting minutes, which are circulated to PIWG members for comment before filing with the Commission.

2014 PIWG Activities

The PIWG met eight times in 2014. The 2014 PIWG meeting dates and meeting minutes filing dates are as follows:

2014 PIWG Meeting Dates and Meeting Minutes Filing Dates

Meeting Date	Filing Date of the Meeting Minutes (See Formal Case No. 766)
January 28	February 7
February 25	March 7
April 15	April 25
May 27	June 6
July 14	July 24
September 30	October 7
October 28	November 7
December 2	December 12

Table 2.2-A

Topics discussed at each PIWG meeting in 2014 are included in Table 2.2-B below.

2014 PIWG Topics

	First Quarter			Second Quarter			Third Quarter			Fourth Quarter

SECTION 2.3 – PIP

In Order No. 16623 on the 2011 Consolidated Report, the Commission stated the following in paragraph 8: "As a preliminary matter, we note our continuing concern with the reliability of the Pepco electrical distribution system… It is through the prism of these [reliability] efforts that we consider the Pepco Consolidated Report." In accordance with the Commission's focus in Order No. 16623 and the guidance of the PIWG, the Company presented its 2014 PIP projects, with a strong emphasis on reliability.

The 2014 PIP projects were as follows:

- 4 kV Distribution Substation Automation Projects
- 4 kV to 13 kV Conversion Projects
- DA Projects
- Priority Feeder Projects

2.3.1 PIP PROJECT STATUS

The year-end 2014 status of the 2014 PIP Projects is included in Table 2.3-A. PIP projects are contained within the Company's REP. To avoid repetition, detail regarding work completed in 2013 and work continuing into 2015 is contained in Section 2.3.2.

Item	Description	PIP Project Year	Spent To Date	2014 Project Amounts[1] (x1000)		Cost Variance Actual from Budget	Project Status
				Budget	Actual		
1	4 kV Distribution Substation Automation Projects	2014	$4,707	$785	$523	($262)	The substation automation work at 12th street Sub 126, G Street Sub 28, Oliver Street Sub 146 was completed. The substation automation engineering was completed at Twining City Sub 150, 53rd Street Sub 48, and Chesapeake Street Sub 181. The construction began at Sub 150 on January 2015 and will continue at Sub 181 on Fall 2015 and at Sub 48 on Spring 2016.
2	4 kV to 13 kV Conversion Projects	2014	$73,785	$24,947	$24,527	($420)	Georgetown Sub.12; Harvard Sub. 13; N Capitol Sub. 40; 12th St Sub. 126; Anacostia Sub. 8; 23rd St Sub. 131; Harrison Sub. 38
3	Distribution Automation Projects[2]	2014	$15,148	$6,794	$3,889	($2,905)	The scope for ASR projects is currently being modified to account for DC PLUG project. In the interim, an alternate plan for completion in 2016 has been formulated. This and some delay in RMS equipment delivery accounts for the majority of the under-expenditures in 2014. RMS-Sub 212 Northeast network awaiting completion of network split--EC[3] Q2 2015; Sub 18 Central Network RMS moved to EC[3] Q3 2015.
4	Priority Feeder Projects[4]	2014	$9,912	$15,842	$9,912	($5,930)	**Expected Completions:** 2014 feeders: OH feeders 14031, 15085 and UG feeder 53 - Q1 2015. 2013 carry over feeders: OH feeder 15166 -Q1 2015. 2014 feeders 15009, 15173, 15867, 14753, 14136, 15171,15021, 15199, 14717, 14758, 15130, 212, 15207R; 2013 carry over feeders 14786, 14788, 14014, 15801, 14787, 15707, 14009; 2012 carry over feeders 166, 141, 15702 - **Work complete as of Q4 2014.**

Note: 1) Project amounts are for 2014 only. 2) Values are net, after DOE reimbursements. 3) EC stands for Expected Completion, including integration with IT systems. 4) Priority Feeder Projects "Spent to Date" is for the current year.

Table 2.3-A

2.3.2 PIP PROJECT DETAIL

Detail addressing each of the 2014 PIP projects – including work completed in 2014, work forthcoming in 2015, and longer-term plans – is provided below.

2.3.2.1 4 kV Distribution Substation Automation Projects

This reliability improvement work is not included in the REP.

Status: In 2014, at G Street Sub. 28, transformer #2 secondary protection and alarm installation work was completed. Also, additional automation work was completed on the existing transformers#1 and #4 secondaries. At Oliver Street Sub 146, automation work was completed including the installation of feeder and transformer breaker protection relays as well as the Digital Remote Terminal Unit (DRTU).

2015 Plan: Based on current system needs, Pepco will continue to focus on automating transformer secondaries, including the installation of feeder, bus-tie, and transformer breaker protection relays at Twining City Sub 150 and Chesapeake Street Sub 181. The engineering and equipment procurement for Fifty-third Street Sub 48 automation work will be completed and the installation of this equipment is scheduled for Spring 2016. The estimated expenditure for 2015 is $702,982. A full discussion of current and planned substation automation work is provided in Section 1.3.1 of this report.

2.3.2.2 4 kV to 13 kV Conversion Projects[39 40]

These projects are included in the REP Load Growth program.

Background: The 4 kV distribution system supplies load throughout various neighborhoods in the District of Columbia. The 4 kV system has provided an effective and reliable supply to Pepco customers for many years. However, the 13 kV system is capable of supplying a greater density of load and generally produces less electrical losses. Therefore, as load density increases locally, or the system requires more maintenance and replacement becomes the best economic alternative, the 4 kV system is gradually being replaced with a 13 kV distribution system.

Magnitude of the Conversion: There are presently 150 megawatts of 4 kV load on the system, mostly in the District of Columbia. Over the next ten years, approximately 54 megawatts (including growth) will be converted to 13 kV service. Allowing for load growth, approximately 110 megawatts are projected to remain on the 4 kV distribution system by 2024. This 4 kV load will be located primarily in Wards 3, 7 and 8 where the load is served by substations that have either multiple transformers or are networked together through the feeder primaries. These remaining 4 kV areas are considered reliable

---

[39] In Order No. 16091 at paragraphs 50, 53, and 64, the Commission stated the following:

50. *Decision. We agree with the Staff recommendation and require Pepco to provide justification for any deviations from the plan schedules and annual budgets for 4 kV to 13 kV conversion projects in its Consolidated Reports, excluding minor deviations of less than 5%. This information may be provided in the discussion of "Reliability Projects."*
53. *Decision. …we have not adopted the Staff's "replace or rebuild" recommendation. However, we agree that future Consolidated Reports should contain detailed schedules and budgets for Reliability Projects, as well as justification for deviations from those schedules and budgets. We shall require Pepco to submit such schedules in future Consolidated Reports.*
64. *Pepco IS DIRECTED to provide detailed schedules and budgets for conversion projects, as well as justification for any non-minor deviations from these , consistent with Paragraphs 50 and 53 of this Order;*

[40] Commission Order No. 16623 states the following:

32. *Staff Recommendation: Require Pepco to provide and submit a report as to whether the budgets and schedules for each of the four 4 kV to 13 kV conversion projects have undergone non-minor deviations from previous plans. Include the justification for such deviations.*
33. *We accept the Staff's recommendation and direct Pepco to include a complete update in the 2012 Consolidated Report, including changes in budgets and schedules and justification for each non-minor deviation.*
54. *Pepco is DIRECTED to provide a report of conversion projects consistent with paragraph 33;*

due to the shortness of the feeders and the availability of ready backup. Areas that are going to be maintained and not converted will involve upgrading of substantial transformer equipment and other supporting equipment.

<u>Areas Scheduled for Conversion:</u> Areas supplied by the following substations are scheduled to have conversion work performed in the next ten years:

• Georgetown Sub. 12	NW	Underground conversion
• Harvard Sub. 13	NW	Underground conversion
• North Capitol Sub. 40	NE	Overhead conversion
• Twelfth Street Sub. 126	SW	Underground conversion
• Anacostia Sub. 8	SE	Overhead conversion
• Fort Carroll Sub. 130	SE	Overhead conversion
• G Street Sub. 28	NE	Underground conversion, proposed for 2017

The 2014 PIP Project "4 kV to 13 kV Conversion Projects" includes all but the last of the conversion projects listed above.

All of the projects described below are multi-year projects with multiple phases. Five of the seven projects were initiated prior to 2014, and the seventh (G Street Sub. 28) is currently scheduled to commence in 2017. Dollars spent on these projects may fluctuate over the years to account for project phasing. The 2015 budget is lower the 2014 budget because the 4 kV conversions at Harrison Sub. 38 are scheduled for completion in the first half of 2015 and proposed conversion work at Anacostia Sub. 8 will be completed during the course of the DC PLUG initiative. The Anacostia conversion work is scheduled to be completed during the course of the DC PLUG initiative because much of the Anacostia 4 kV load will be converted to Feeder 15177, which was selected to be placed underground. The overall budget for the 4 kV conversion projects is still in line with the Company's long term conversion plan.

Status: In 2014 Pepco spent $24,856,000 on its 4 to 13 kV conversion projects, $2,284,000 less than the budget of $27,140,000. The deviation between the 2014 budget and actual expenditures is due to a combination of work being delayed by permitting and work time restrictions finding conduit breakdowns that slowed work and a cost-saving scope changes through discovery of usable empty conduits in the field.

Convert load at Georgetown Sub. 12 from 4 kV to 13 kV and retire 4 kV Substation

A modernization of this area infrastructure started in 2001. It includes the 4 to 13 kV conversions that will ultimately retire the 4 kV radial distribution system supplied from Georgetown Sub. 12. The 4 to 13 kV conversion has been completed for the area between M Street to the south, P Street to the north, Wisconsin Avenue to the west and 27th Street, NW to the east, by extending the two 13 kV distribution feeders from Georgetown Sub. 12. In addition, conversions along M Street, Prospect Street, and N Street west of Wisconsin Avenue were completed in 2010 and 2011. Conversions continued along O and P Streets west of Wisconsin Avenue and concluded in 2012. Conversions of the area north of P Street and east of Wisconsin Avenue were largely completed in 2014. The remainder of this section plus the section west of Wisconsin Avenue and north of P Street are scheduled to be completed in the 2015 timeframe. The section south of M Street NW identified as Phase 6, which has long and lightly loaded feeders, will be converted to Georgetown 13 kV feeders in the 2016-2017 timeframe.

Existing Configuration: The 4 kV underground radial distribution system serves mostly residential and some small commercial loads. Moderate load growth is anticipated for this isolated area but there are basically no external ties to deliver this power. The existing underground infrastructure, conduit and cable are in need of remediation with a history of extended outages due to limited transfer capability and circuit configuration and conduit construction that limits the size of cable that can be installed and provides limited physical protection to the cables.

The Georgetown 4 kV substation was rebuilt in the 1980s however the 4 kV underground infrastructure is the original construction and is nearing its full capacity.

Proposed Enhancement: Convert all 4 kV load to 13 kV distribution feeders

Status: Project is in progress. The trunks of three 13 kV feeders were extended along Wisconsin Avenue from N Street to Reservoir Road, NW. Two half loops have been built and 3 MVA of load has been converted to 13 kV operation. Conduit has been built along Q Street, Reservoir Road, 34th Street and 35th Street, NW. The 2014 budget for this project was $4,902,000 and approximately $7,009,000 was actually spent in 2014. The deviation between 2014 budget and actual was due to a significant amount of conduit being constructed that was not initially anticipated. The current project in-service date is June 2017.

Georgetown Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$5,462	$4,715	$5,000	$0	$0	$15,176

Convert load at Harvard Sub. 13 from 4 kV to 13 kV and retire 4 kV Substation

This project is recommended to initiate infrastructure upgrades to the existing 4 kV system in the Upper Shaw and Harvard/Columbia Heights areas. Two 13 kV Feeders were extended from Florida Avenue Sub. 10 in 2011 to provide capacity for the conversion and to allow load to be transferred to Sub. 10 from Sub. 13. Existing 13 kV Feeders from Sub. 13 and new 13 kV Feeders from Sub. 25 will be used to convert the final portion of 4 kV load starting in 2015.

The current phases of conversion extended two new feeders from Florida Avenue Sub. 10 along Florida Avenue and Barry Place to convert 4 kV load in the area bounded by U Street NW to the south, 13th Street NW to the west, Harvard Street NW to the north and 7th Street NW to the east. This phase was largely completed in 2014. Pepco plans to have the remaining 4 kV load south of Harvard Street and west of 7th Street plus the 4 kV load east of 7th Street and south of Harvard Street largely converted in 2015. Pepco also plans to complete the mainline extension of the aforementioned new feeders from Champlain Sub. 25 in 2015 and plan to convert 4 kV load to these feeders beginning in 2016.

Existing Configuration: The existing 4 kV underground distribution system serves residential and small commercial loads. Modest load growth is anticipated for this area which is isolated from the rest of the system and has no external ties. The existing underground system experiences feeder overloads, voltage deficiencies and a greater than average number of underground cable outages due to the age and condition of the cable and limited transfer and switching capabilities.

Proposed Configuration: Convert 4 kV load to 13 kV distribution feeders and retire Harvard Sub. 13 which currently operates at 4 kV.

Status: The building of conduit and extension of main trunk of the two 13 kV feeders out of Florida Avenue has been completed and the building of conduit and extension of laterals to convert 4 kV load was begun in 2012 and four 4 kV feeders, about 3 MVA of load, has been converted in the area bounded by 11th Street, V Street, Georgia Avenue, and Euclid Street, NW. The 2014 budget for this project was $7,337,000 and approximately $3,120,000 was spent in 2014. Actual spending was below budget because duct breakdowns found in the field required reengineering and permitting. The extension of the two new Champlain feeders has been delayed due to delays in permits being issued. And, the half loop job from Sherman Avenue and Barry Place, NW is being redesigned due to new large commercial loads at 8th and V Streets, NW. The current project in-service date for the entire project and final retirement of the substation is December 2018.

Harvard Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$6,184	$5,477	$7,165	$7,925	$0	$26,751

Convert load at North Capitol Sub. 40 from 4 kV to 13 kV and retire 4 kV Substation

This project relates to an extension of existing and new 13 kV feeders to convert all 4 kV load served by North Capitol Street Sub. 40 to 13 kV.

The North Capitol Street 4kV system serves mostly residential and small commercial customers in the Manor Park, Fort Totten, and Petworth neighborhoods. The first phase of this project will convert load from portions of North Capitol Sub. 40 Feeders 482 and 485 along 4th Street, NW between Buchanan and Hamilton Streets, NW to Fort Slocum Sub. 190 - 13kV Feeders 15006, 15012 and 15015. This phase was completed in 2013. 2014 saw the completion of conversions along Hamilton Street, NW, Hawaii Avenue, NE and Fort Totten Drive, NE.

Existing Configuration: The North Capitol Sub. 40 4 kV system is an isolated area on the Pepco distribution system that is not connected to any other 4kV substations or systems. Recent substation inspections have revealed deteriorating circuit breakers. The Allis Chalmers switchgear necessitates the salvage of spare parts from like equipment because the original equipment manufacturer is no longer in business and other manufacturers no longer supply parts for this equipment.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire North Capitol Sub. 40 - 4 kV.

Status: The project is underway. As of the end of 2014, several 13 kV trunk extensions have been completed and approximately 5 MVA of 4 kV load has been converted to 13 kV. The 2014 budget for this project was $2,406,000 and approximately $1,852,000 was actually spent in 2014. The deviation of budget to actual was because some engineering and construction resources were directed to other projects. The current in-service date for the rest of the conversion project is December 2017.

North Capitol Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$1,107	$1,117	$2,401	$0	$0	$4,625

Convert load at 12th Street Sub. 126 from 4 kV to 13 kV and retire 4 kV Substation

This project will extend two 13 kV feeders and install two 13 kV transformers to 4 kV step-down transformers in order to convert or transfer all 4 kV load supplied by 12th Street Sub. 126.

The 12th Street 4 kV system serves residential and small commercial customers in Southwest area and National Park Service buildings, street lights and traffic signals in the National Mall area. The conversion and retirement of the 12th Street Sub. 126 will be done in two phases. Phase 1 will construct an 8 way conduit bank from 2nd and C street SW to the vicinity of 7th and Maryland Avenue SW. It will involve the construction of approximately 1.0 miles of 8-way conduit bank. Phase 2 will involve extending Feeders 15294 and 15295 to two new three way switches. Loops will then be extended from the switches to supply load around the National Mall and Southwest Waterfront. The last phase will require extending Feeders 15294 and 15295 to two new 3-way switches and extending laterals to the area of Hanes Point, the Tidal Basin and the 14th Street Bridge.

Existing Configuration: The 12th Street Sub. 126 contains oil circuit breakers that will be removed based on the review of condition and reliability. Both the 13 kV/4 kV transformers are identified as in need of eventual replacement. These oil circuit breakers are no longer manufactured and the manufacturer no longer provides spare parts. As part of the conversion process, this substation will be retired. Economic analysis concluded the least cost plan was to convert most of the load and transfer the rest to two 13/4 kV unit type transformers rather than replace the transformers and circuit breakers and maintain the substation switchgear and related infrastructure.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire Twelfth Street Sub. 126 – 4 kV including the transformers and oil circuit breakers.

Status: The extension of two 13 kV feeders from oil-switches on Maryland Avenue and 6th Street SE to 2nd and D Street SW was completed in 2013. Conduit and tap-holes have been constructed and cable extended and 0.2 MVA of load converted in 2014. The 2014 budget for this project was $4,201,000. Approximately $5,592,000 was spent in 2014. The difference between the 2014 budget and actual amounts was due to Pepco construction being able to install large amounts of conduit in the area in and around the National Mall. The current project in-service date is December 2017.

12th Street Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$4,968	$6,744	$4,000	$0	$0	$15,712

Convert Load at Anacostia Sub. 8 from 4 kV to 13 kV and Retire 4 kV Substation

The project relates to the extension of 13 kV feeders from Alabama Avenue Sub. 136 in order to convert all 4 kV load from Anacostia Sub. 8 4 kV and retire the Anacostia Sub. 8 – 4 kV substation.

The Anacostia Sub. 8 4 kV system supplies residential and small commercial load in the Anacostia, St. Elizabeth's, Barry Farm, and Buena Vista neighborhoods in Southeast Washington, D.C. New and existing 13 kV overhead feeders from Alabama Avenue Sub. 136 will be extended in order to convert all 4 kV load.

Existing Configuration: Anacostia Sub. 8 is supplied by two 34 kV feeders from Buzzard Point Station B. Converting 4 kV load from Anacostia Sub. 8 will also relieve load from Buzzard Point Station B 13 kV substation which is approaching its firm capacity. Review of the equipment at Anacostia Substation and the 34 kV supplies indicated the need to replace all of this equipment for long term reliability. Instead of rebuilding this station, conversion of the 4 kV load and transfer of the 13 kV load to Alabama Avenue Substation will allow the retirement of the station and supplies and improve the overall reliability of the distribution system in this area.

<u>Proposed Configuration:</u> Convert all 4 kV loads to 13 kV distribution feeders and retire Anacostia Sub. 8 – 4 kV.

<u>Status:</u> Much of the Anacostia 4 kV load has been converted over the past several years as part of the 23rd Street and Anacostia 4 kV conversion projects. Construction for the Anacostia 4 kV conversion project began in 2012 and about 1.2 MVA load has been converted to 13 kV. The 2014 budget for this project was $0 and approximately $34,000 was spent in 2014. There was a small amount of money spent in 2014 to complete the first phases of recommended conversions. The next phases are being engineered and work should begin in 2015 on the 0.4 MVA of load that is being converted to overhead Feeder 15173. The work to convert the remaining 1.7 MVA to Feeder 15177 is being moved into the scope of the DC PLUG initiative. Feeder 15177 is in the 2nd group of feeders to be undergrounded. Pepco determined that the most prudent course of action was to convert the 4 kV portions at the same time that they are being undergrounded with the rest of Feeder 15177. This course of action reduces costs overall and is more efficient because Pepco is not first upgrading the 4 kV overhead to 13 kV overhead and then undergrounding it. It is anticipated that all the undergrounding/conversion work on Feeder 15177 will be completed in 2017 and Anacostia Sub. 8 would be retired at that time.

Anacostia Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$245	$0	$0	$0	$0	$245

Convert load at Harrison Sub. 38 from 4 kV to 13 kV and retire 4 kV Substation

This project was recommended in 2012 to initiate infrastructure upgrades to the existing 4 kV system in the Chevy Chase and Friendship Heights areas. Substantial construction began in 2013. One 13 kV feeder will be extended from Van Ness Sub. 129 in 2014 to provide capacity for converting three out of the six 4 kV feeders. The other three feeders will be transferred to existing Oliver Street Sub. 146.

This work is being done to facilitate the retirement of the two 4 kV transformers and the 4 kV switchgear at Harrison Sub. 38. A project was proposed in 2011 to build a substation that would replace Harrison Sub. 38. Pepco's current plan is to rebuild Harrison Sub. 38 on the current substation site, but as a 13 kV substation only. The building and switchgear at Harrison Sub. 38 are in deteriorated condition as is one of the 4 kV transformers. A decision was made not to replace the Harrison 4 kV substation requiring that load be converted or transferred to other substations. The 52 year old 4 kV transformer at Oliver Street Sub. 146 was replaced in 2013 which has increased capacity at that substation increasing capacity to facilitate the transfers.

Existing Configuration: The existing 4 kV underground distribution system serves residential and small commercial loads. Low load growth is anticipated for this area. Harrison Sub. 38 and Oliver Street Sub. 146 are part of the Northwest District of Columbia 4 kV primary system so most all 4 kV feeders are served from two substations.

Proposed Configuration: Convert about half of the 4 kV load to 13 kV distribution feeders, transfer the other half to Oliver Street Sub. 146 and retire the 4 kV substation at Harrison Sub. 38.

Status: Construction began in 2013 to extend a new feeder from Van Ness Sub. 129 to facilitate the 4 kV conversions and to build conduit on Western Avenue to enable new feeders to be extended from Oliver Street Sub. 146 so that three Harrison feeders can be resupplied out of that substation. The 2014 budget for this project was $5,294,000. Approximately $6,584,000 was spent in 2014. The difference between budget and actual spending occurred because more conduit needed to be constructed than initially anticipated. The current in-service date is June 2015.

Harrison Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$1,650	$0	$0	$0	$0	$1,650

Convert load at Fort Carroll Sub. 130 from 4 kV to 13 kV and retire 4 kV Substation

This project was recommended in 2013 to initiate infrastructure upgrades to the existing 4 kV system in the Congress Heights area. Construction is scheduled to begin in 2014. This project will extend existing feeders from NRL Sub. 168 and Alabama Avenue Sub. 136 to convert the load from three 4 kV feeders. Two other 4 kV feeders out of Fort Carroll Sub. 130 were converted in the past few years as part of other conversion projects.

This work is being done to facilitate the retirement of the single 4 kV transformer and the 4 kV switchgear at Fort Carroll Sub. 130 because the switchgear at Fort Carroll Sub. 130 was assessed to be in a deteriorated condition and in need of replacement. Pepco determined that since this substation was to be retired at some point in the future, it was most economical to convert the 4 kV load and retire this substation in 2015 rather than replace the switchgear and then convert load and retire the substation at a later date.

Existing Configuration: The existing 4 kV overhead distribution system serves residential and small commercial loads. Low load growth is anticipated for this area.

Proposed Configuration: This project proposes to extend existing feeders from NRL Sub. 168 and Alabama Avenue Sub. 136 to convert the load from three 4 kV feeders. Two other 4 kV feeders out of Fort Carroll Sub. 130 were converted in the past few years as part of other conversion projects.

Status: Construction began in 2014 and some overhead preparatory work has been completed. The 2014 budget for this project was $4,235,000. Approximately $664,000 was spent in 2014. The difference between budget and actual spending occurred because savings were found during the engineering of the project and delays in obtaining some permits reduced the amount of work that was completed in 2014. The project is scheduled to be completed by June 2016.

Fort Carroll Sub. Conversion:

2015 – 2019 Budget (Figures in Thousands of Dollars)

2015	2016	2017	2018	2019	Total
$2,248	$493	$0	$0	$0	$2,741

2.3.2.3 DA PROJECTS

These projects are included in the REP DA program.

DA is the conversion of a manually operated distribution system with limited available status information and limited control to a system that not only is fully automated but also performs operations totally independent of any human intervention. Advancements in technologies have made these automation activities practical for the lower voltage systems and will significantly change the way the Company will respond to outages and operate and restore the electric system.

Status: All DA ASR projects for 19 feeders under the SGIG program have been completed. New ASR plans for 5 feeders are planned for installation in 2015, with activation planned for 2015. See Attachment A for details of the DA ASR plans.

A full discussion of current and planned DA work is provided in Section 1.3.1 of this report.

2.3.2.4 PRIORITY FEEDER PROJECTS

These projects are included in the REP Feeder Improvement program.

Status: In response to the Commission’s focus on preventing repeat Priority Feeders, Pepco has adjusted its feeder remediation strategy to a more comprehensive approach. Instead of focusing on locations where previous failures have occurred, the entire feeder is reviewed to address potential locations for future failures. During this review of the 2014 Priority Feeders, including detailed field inspections, Pepco identified additional opportunities to increase feeder reliability based on infrastructure conditions. The actual expenditure of the 2014 Priority Feeder Projects is $9,912,324. A more detailed description of the work can be found in Section 2.4.1.

An extensive discussion of the 2015 Priority Feeder projects is contained in Section 2.4.1 of this report.

SECTION 2.4 – PERFORMANCE

2.4.1 PRIORITY FEEDERS & AGGRESSIVE INITIATIVES

2.4.1.1 FEEDER PERFORMANCE AND AGGRESSIVE INITIATIVES [41]

[41] Order No. 16975 states the following at paragraphs 58 and 59, 60, and 105:

58. *Decision: …We therefore require Pepco to provide in the 2013 Consolidated Report, the information recommended by the Staff including an explanation of any discrepancies between work planned and work completed…. In Order No. 15941, the Commission required Pepco to provide specific information regarding any 4 kV feeder that has appeared on the Priority Feeder List three times or any 13 kV feeder that has appeared on the Priority Feeder List four times. On June 13, 2012, Pepco filed a report pursuant to that Order, providing information on two 13 kV feeders, 14717 and 14768. The Commission believes it is necessary to expand the scope of Pepco's reporting on feeder improvement to include any feeder that has appeared on the priority feeder list more than twice. Therefore, we require Pepco to provide the information required in paragraph 13 of Order No. 15941 in the future Consolidated Reports for any feeder appearing more than twice on the Priority Feeder List….*

59. *In future Consolidated Reports, Pepco shall include the following information about each feeder on the Priority Feeder List:*

    (1) a detailed description of outages, including causes and corrective actions taken;

    (2) the SAIDI, SAIFI, number of interruptions, and number of hours of customer interruptions for that feeder for each year beginning with the year the feeder first appeared on the Priority Feeder list;

    (3) a map showing the feeder service area, including affected neighborhoods;

    (4) an analysis of why past corrective actions failed;

    (5) Pepco's proposed solution to the feeder's reliability problem, including an explanation of options considered with the cost/benefit analysis of each and justification for the option recommended;

    (6) a cost/benefit analysis of the solution, including budget and cash flows by year, as well as any impact on the revenue requirement; and

    (7) a detailed justification for its aggressive feeder remediation measure of replacing open wire secondary with triplex secondary conductor.

60. *The Commission notes that in recent PIWG meetings, Pepco has indicated its intention to change the methodology which it uses to determine Priority Feeders. A change in methodology would diminish the value of the Priority Feeder List in determining historically poorly performing feeders and would lessen our ability to track and compare the historical data. Therefore, we require Pepco to provide two Priority Feeder Lists, using both the historical (CPI) and any new methodologies in the 2013, 2014 and 2015 Consolidated Reports. In addition, the Commission requires Pepco to provide the information required by paragraph 13 of Order No. 15941 for any feeder appearing more than twice on the Priority Feeder List using either the historical or any new method.*

105. *Pepco is DIRECTED to provide information on Priority Feeders consistent with paragraphs 58-60 herein;*

Feeder Performance[42]

Each year Pepco analyzes the performance of its feeders to determine the relative ranking of each feeder from the best to the least reliable. From this ranking, Pepco selects the least reliable two percent (2%) of its feeders (excluding the feeders selected through the prior year's study) to analyze and identify actions which likely will improve the reliability of the feeders, and therefore the system.

Beginning in 2013, the Company began using the SPC a method that provides greater system performance improvement potential (the "New Method"). The New Method value is calculated by the summation of 75% of the SAIFI and 25% of the SAIDI for each feeder.

In addition to the New Method to select Priority Feeders, Pepco uses CPI to rank the performance of its distribution feeders. Feeders that would have been selected as Priority Feeders using the CPI method are reported to the Commission in this report as "CPI-Selected Feeders" and are included in the Company's Feeder Improvement category of its REP program. CPI is determined by evaluating four measurements of reliability: number of interruptions (NI), number of hours of customer interruptions (CHI), SAIFI, and SAIDI. A description of the design of CPI can be found in Section 4.4 of this report.

The 2014 Priority Feeders and the CPI-Selected Feeders were selected using outage data from October 1, 2012 through September 30, 2013. Excluded from this annual study are the Priority Feeders from the prior year, which typically would not show the full results of corrective actions until a full year following the completion of the corrective actions.

The 2014 Priority Feeders were selected after September 30, 2013, at which time there were 796 feeders (4 kV and 13 kV) in the District of Columbia. Sixteen feeders represent

[42] The Electricity Quality of Service Standard D.C.M.R. 3603.6 states the following:

> *3603.6 The utility shall continue the current reporting of the worst performing (lowest two (2) percent) feeders (utility methodology) and corresponding corrective action plans, with the action taken in year 1 and the subsequent performance in year 2 in the annual Consolidated Report.*

approximately 2% of Pepco's current District of Columbia feeder count. Figures 2.4-A1 and 2.4-A2 contains maps of the 2014 Priority Feeders.

In addition, as of January 1, 2013, Pepco began changing the way feeders are counted in a jurisdiction (District of Columbia or Maryland), a modification that was originally presented at the September 2012 PIWG Committee Meeting. However, as of the time of the 2013 Priority Feeder selection, feeder reliability was still being tracked according to the old method of feeder classification in which feeders were assigned to a jurisdiction based upon the area in which the substation resides. Pepco's new method of counting feeders, which will assign each individual feeder to the jurisdiction where the majority of customers reside, took effect for selection of the 2014 Priority Feeders.

Cost/Benefit Discussion

Order No. 16975 requires that Pepco provide the following in this and future Consolidated Reports (paragraph 59, item 6):

> *(6) a cost/benefit analysis of the solution, including budget and cash flows by year[43], as well as any impact on the revenue requirement;*

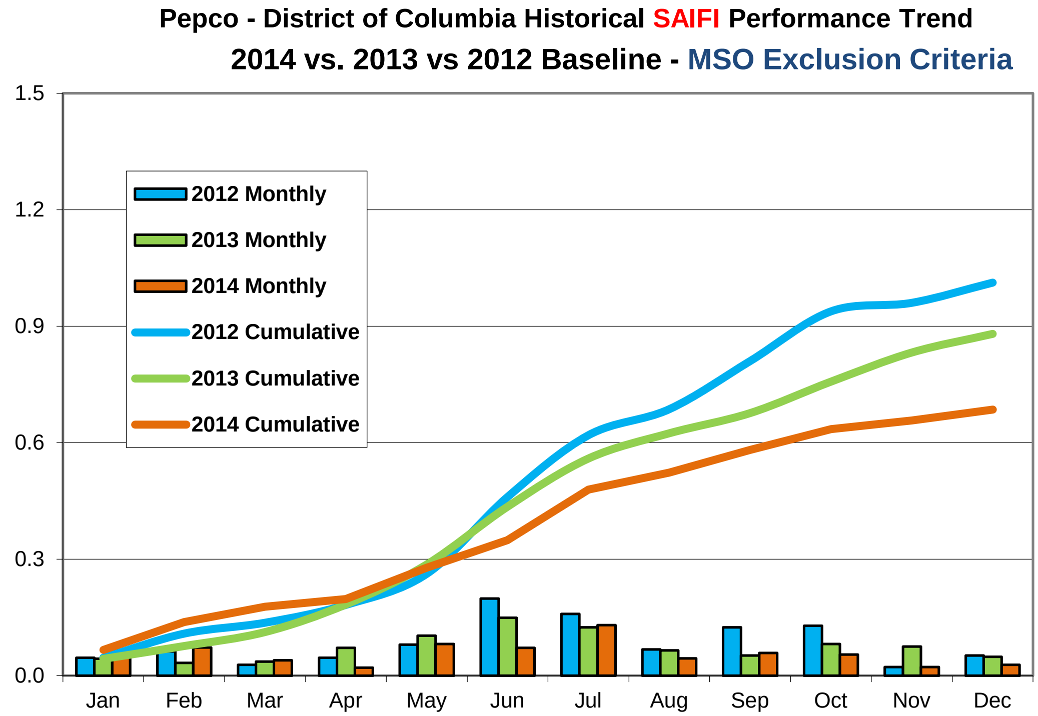
The measurement of benefits associated with feeder reliability projects generally depends on the outage history of the feeder and the likelihood that a portfolio of remediation activities will reduce or totally eliminate similar outages for the same or similar cause. Simply allocating a portion of the previous customer interruptions or customer minutes of interruption prior to the remediation activity is a way of qualifying the relative cost / benefit of individual remedial efforts. This is, however, not a dependable method of forecasting future feeder or aggregate system reliability because no remediation tactic is all inclusive of every possible outage cause. Likewise, this approach assumes all other inputs to system reliability are held constant (same weather, same animal events, same tree faults, etc.), which is unlikely.

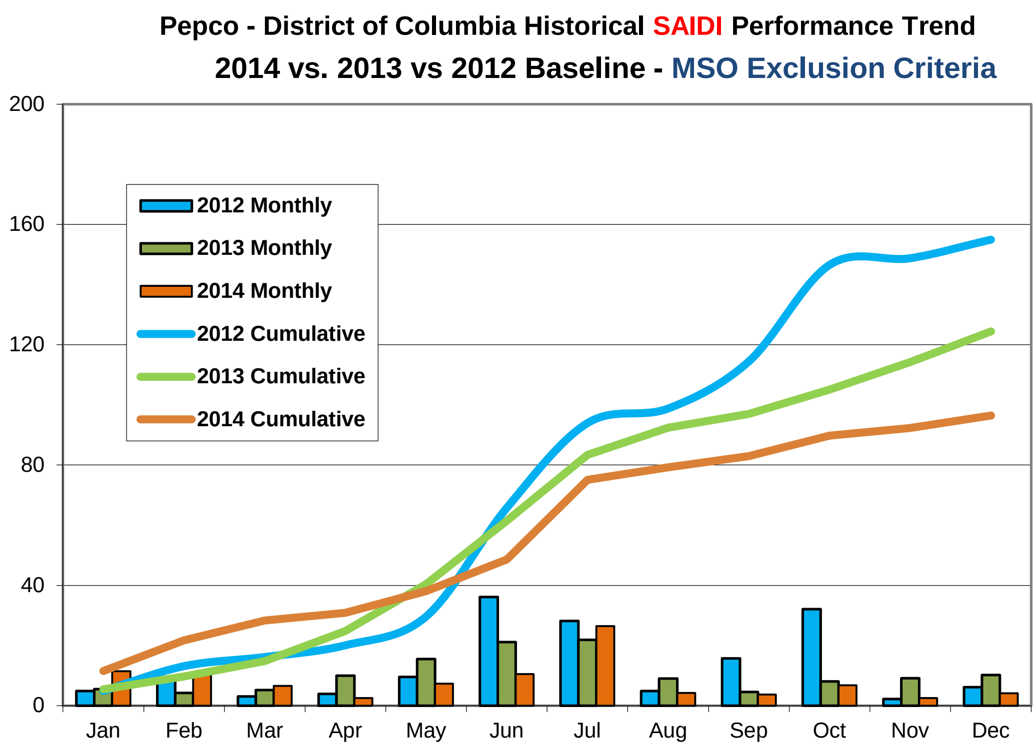
[43] The budget and cash flow discussion is provided in Section 2.4.1.2 below on a feeder by feeder basis.

Similarly, the measure and inclusion of cost/benefit per feeder or per individual initiative would potentially serve to reduce the field of options available to apply in feeder performance improvement. Some activities are not as efficient or economical as others based on a simple mathematical evaluation. However, the potential exclusion of these activities based on their relative inefficiency at the feeder or activity level would mean that the best overall portfolio of remedies could not be utilized in system level improvement. Further, with the advances in sectionalization technology, standard cost benefit analysis could drive a utility to employ only mitigation efforts rather than more appropriate but costly fault elimination tactics. Pepco evaluates each of these options and implements mitigation as well as elimination techniques when evaluating work to improve reliability of a feeder.

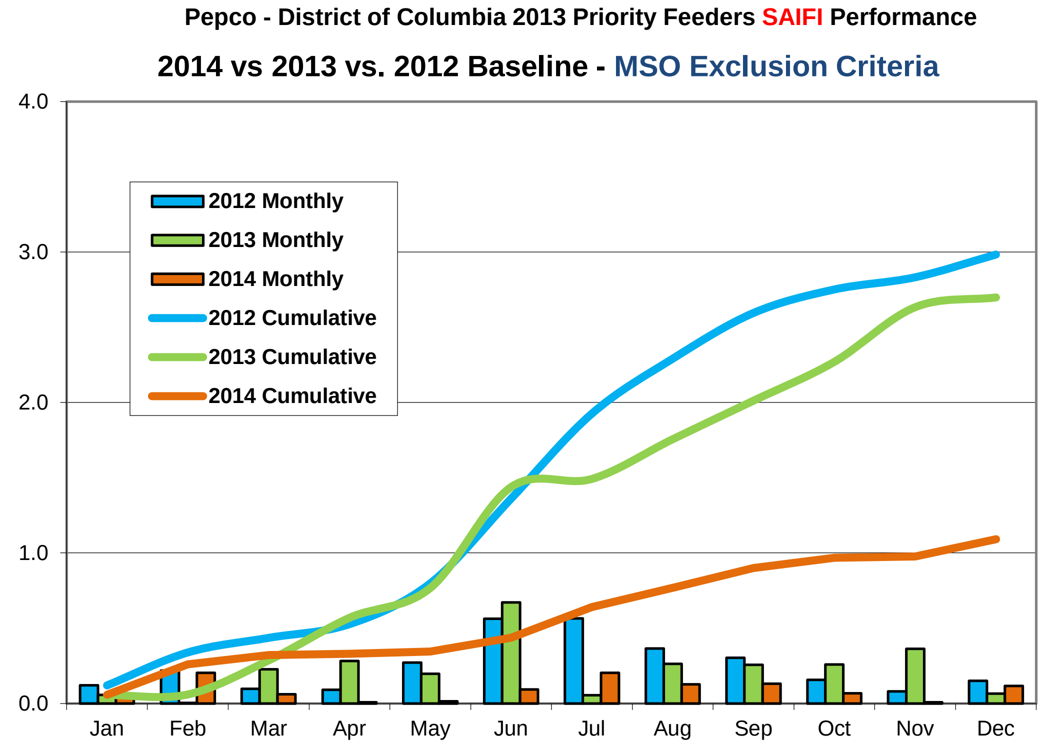
The method to evaluate benefit for an electric distribution feeder is a measure of the improvement in reliability performance. This comparison is made between the feeders' historical reliability performance before corrective action is taken and the reliability performance after the corrective work has been completed. The following figures show the improvement in both overall system performance and in the priorities feeders where work was performed during 2014. In all cases improvement is shown year over year and customers are experiencing fewer outages and shorter duration when outages do occur. These results indicate that the REP and Priority Feeder programs are working and realizing positive results. The Company will continue these efforts to select new feeders each year and identify the appropriate corrective actions to take in order to improve overall reliability.

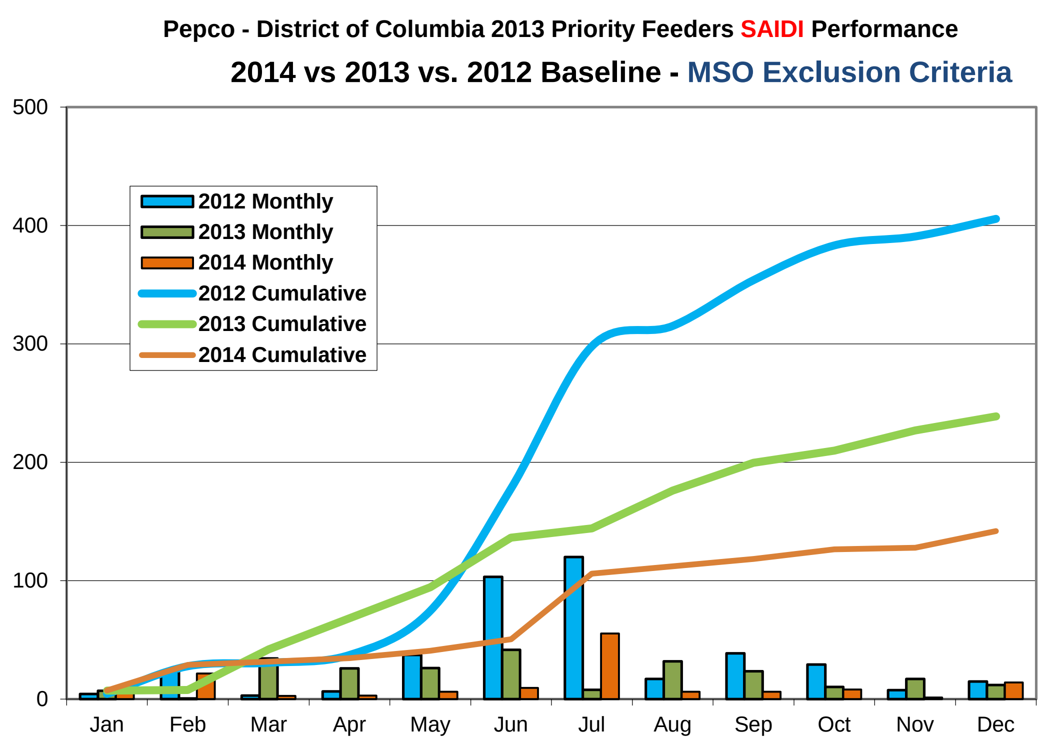
District of Columbia Historical SAIFI and SAIDI Performance





2013 Priority Feeders SAIFI and SAIDI Performance





In addition, as addressed in the REP Metrics discussion, Pepco has employed a statistical modeling program to project and evaluate the expected reliability performance of the electric system based on the impacts of the REP. Specifically, this model provides a probabilistic range of estimated SAIFI and SAIDI improvement values for the District of Columbia as a function of carrying out the elements of the REP.

The model is based on forecasted reliability improvement from three components of the REP: VM, feeder improvement work, and DA implementation. The improvement levels for each of these activities are based on the actual reliability performance during 2011-2013. The balance of the REP project categories are expected to contribute to additional improvements in reliability performance.

The forecasted results are illustrated in the Charts 5 and 6 in the REP Metrics discussion.

The charts show that the expenditures planned in the next five years alone will not achieve both SAIDI and SAIFI EQSS goals. Various process improvements will also be needed to achieve the SAIDI results towards the end of the five year period. In addition natural variations due to storms can have great impact on the yearly results and therefore the Company needs to strive for better than the minimum performance in order to achieve the stated standards.

Aggressive Initiatives[44]

The priority feeder program is an enhanced initiative including both reliability work routinely performed on the selection of priority feeders supplemented with more aggressive initiatives.

Aggressive initiatives may include the following:

- Installation of tree wire in close configuration construction to replace bare wire through heavily treed areas where aggressive tree trim and standard cross-arm construction would have limited success or is restricted by ordinance or property owners.
- Installation of PAC for use as the main trunk of the feeder with the existing mainline reconfigured as fused laterals.
- Installation of automatic circuit reclosers (ACR) in loop scheme configuration to automatically sectionalize faulted sections of the feeder and provide automatic backup to unfaulted sections.
- Installation of remote operated load break switches into the loop scheme configuration with the automatic circuit reclosers.

Pepco's proposed aggressive initiatives to its underground distribution feeders are:

4 kV System

In addition to performing Very Low Frequency (VLF) testing and manhole inspections, the process of correcting identified issues also includes the following:

- Installation of tap-holes (switch points) at key locations to improve the ability to isolate problems as well as improving the ability to restore customers following each event.

[44] In Order No. 15152 paragraph 73, the Commission ordered the following:

> *73. Pepco is DIRECTED to investigate the viability of the "aggressive" initiatives for all least performing feeders, to file a progress report regarding the implementation of these initiatives where viable as part of the 2009 Consolidated Report, and to file quarterly progress reports thereafter, consistent with paragraph 62 of this Order;*

In Order No. 15809 paragraph 11, the Commission ordered the following:

> *11. Pepco IS DIRECTED to include in its 2011 Consolidated Report a plan for development and application of "aggressive initiatives" to its underground distribution feeders;*

- Perform a review of the failure history of the area for each failure and comparison of failure locations to replacement history. Perform proactive cable replacement of stretches that were not previously replaced in the area.

Regarding Commission's recommendation (per Order No. 16975) to add switch points to 4kV feeders, over time these 4kV feeders will be converted to 13kV, in which the loop alternate feed design is inherent. In the interim, all of the 4kV systems have back up supply for trunk outages. And for lateral outages, Pepco is replacing cable, installing tap holes, and ultimately converting all current underground 4kV feeders to 13kV feeders.

13 kV System

In addition to performing VLF testing and manhole inspection, correcting identified issues include the following:

- Perform a review of the failure history of the area for each failure and compare failure locations to replacement history. Perform proactive cable replacement of stretches that were not previously replaced in the area.
- Replace all of the problem sections of cable.

For various reasons, not all of the "Aggressive Initiatives" are applied to the Priority Feeders. For example, if a particular feeder is completely underground, installing tree wire, PAC, ACR and remote operated load-break switches would not be applicable as these types of equipment are not used on underground feeders. Similarly, if a feeder is already equipped with remote switching capabilities and the switches are functioning properly, then simply increasing the number of remotely operated switches will generally not yield improvement. Further, if the predominant outage cause for a feeder is not tree-related, installing tree wire along the previous outage locations, will not yield performance improvement.

Order No. 16975 states the following at paragraph 58:
58. …In addition to the information required by paragraph 13 of Order No. 15941, the Commission also requires that Pepco provide detailed justification for its aggressive feeder

remediation measure of replacing open wire secondary with triplex secondary conductor, as recommended by the OPC response.

Explanation for replacing open wire secondary conductors with triplex conductors: Triplex conductors are less susceptible to mechanical damage such as trees, winds, etc. It increases the distance between the primary and neutral conductors which reduces the opportunity for primary related tree outages. Other miscellaneous upgrades will also be performed such as pole, hardwire, and equipment replacements due to deterioration. Upgrading will significantly reduce future equipment failures. Should damage occur, restoration is faster with the triplex conductors. Therefore, the customers will experience lower number of outages as well as a shorter duration of outages. The cost to replace open wire secondary conductors with triplex conductors is $40,000 per mile.

2.4.1.2 2014 PRIORITY FEEDER PROGRAM

Order No. 16975 requires that Pepco provide the following in this and future Consolidated Reports (paragraph 59, item 1):

(1) a detailed description of outages, including causes and corrective actions taken;

Note, modifications may be made to these plans depending on the work associated with the DC PLUG initiative.

2014 2% Priority Feeder Program - District of Columbia - Corrective Actions Proposed vs. Completed/ Pending Completion				
Rank	**Feeder**	**Proposed Corrective Actions, as filed in the 2014 Consolidated Report**	**Detailed Corrective Actions - Completed/ Pending Completion**	**Explanation of Variances/ Comments**
1	14717	• Upgrading approximately 1,900 feet of secondary wire • Upgrading approximately 102 feet of bare wire • Upgrading/replacing approximately 28 poles • Upgrading/replacing approximately 15 transformers • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 331 feet of primary tree wire • Upgrading 2,255 feet of secondary wire • Upgrading 1,365 feet of bare wire • Upgrading/replacing 21 Poles • Upgrading/replacing 35 cross arms • Upgrading/replacing 6 transformer • Upgrading/replacing 38 fuses • Upgrading/replacing 1 gang switch • Installing 70 lightning arresters • Installing 393 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work was completed in 4th quarter of 2014.
2	14758	• Upgrading approximately 17,932 feet of secondary wire • Upgrading approximately 4,128 feet of bare wire • Upgrading/replacing approximately 6 poles • Upgrading/replacing approximately 2 transformers • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 216 feet of primary tree wire • Upgrading 416 feet of secondary wire • Upgrading 11,089 feet of bare wire • Upgrading/replacing 9 poles • Upgrading/replacing 13 cross arms • Upgrading/replacing 10 fuses • Upgrading/replacing 7 transformers • Installing 3 lightning arresters • Installing 212 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work was completed in 3rd quarter of 2014.
3	15207R	• Upgrading approximately 4,760 feet of underground cable • Upgrading/replacing approximately 3 oil switches • Performing inspection of underground oil switches, including cables and fuse boxes • Performing inspection of tap modules.	• Upgrading/replacing 1 transformer • Performing inspection of underground oil switches, including cables and fuse boxes • Performing inspection of tap modules.	The proposed corrective actions were based on the initial outage analysis. However, corrective actions were further defined after the detailed field inspection. This work was completed in 3rd quarter of 2014.
4	15085	• Upgrading approximately 12,670 feet of secondary wire • Upgrading approximately 953 feet of bare wire • Upgrading/replacing approximately 36 poles • Upgrading/replacing approximately 32 transformers • Upgrading/replacing approximately 2 gang switches • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 3,416 feet of primary tree wire • Upgrading 11,163 feet of secondary wire • Upgrading 3,167 feet of bare wire • Upgrading/replacing 49 poles • Upgrading/replacing 44 cross arms • Upgrading/replacing 3 gang switches • Upgrading/replacing 53 fuses • Upgrading/replacing 31 transformers • Installing 18 lightning arresters • Installing 107 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work is currently in Construction and scheduled for completion in 1st quarter of 2015.
5	14136	• Upgrading approximately 51 feet of secondary wire • Upgrading/replacing approximately 2 poles • Upgrading/replacing approximately 3 transformers • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 125 feet of secondary wire • Upgrading 151 feet of bare wire • Upgrading/replacing 1 Pole • Upgrading/replacing 6 cross arms • Upgrading/replacing 1 transformer • Upgrading/replacing 8 fuses • Installing 1 lightning arrester • Installing 48 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work was completed in 4th quarter of 2014.
6	14031	• Upgrading approximately 6,534 feet of primary tree wire • Upgrading approximately 31,807 feet of secondary wire • Upgrading approximately 14,645 feet of bare wire • Upgrading/replacing approximately 242 Poles; • Upgrading/replacing approximately 109 transformers • Upgrading/replacing approximately 5 gang switches • Upgrading/replacing approximately 1 ACR • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 7,193 feet of primary tree wire • Upgrading 11,006 feet of secondary wire • Upgrading 6,296 feet of bare wire • Upgrading/replacing 83 Poles • Upgrading/replacing 105 cross arms • Upgrading/replacing 64 transformers • Upgrading/replacing 2 gang switches • Upgrading/replacing 1 ACR • Upgrading/replacing 92 fuses • Installing 26 lightning arresters • Installing 308 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work is currently in Construction and scheduled for completion in 1st quarter of 2015.

2014 2% Priority Feeder Program - District of Columbia - Corrective Actions Proposed vs. Completed/ Pending Completion				
Rank	Feeder	Proposed Corrective Actions, as filed in the 2014 Consolidated Report	Detailed Corrective Actions - Completed/ Pending Completion	Explanation of Variances/ Comments
7	15199	• Upgrading approximately 23,457 feet of secondary wire • Upgrading approximately 129 feet of bare wire • Upgrading/replacing approximately 120 poles • Upgrading/replacing approximately 50 transformers • Upgrading/replacing approximately 1 SF6 switch • Upgrading/replacing approximately 1 ACR • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 796 feet of primary tree wire • Upgrading 32,270 feet of secondary wire • Upgrading/replacing 1 ACR • Upgrading/replacing 1 SF6 switch • Upgrading/replacing 90 poles • Upgrading/replacing 20 cross arms • Upgrading/replacing 89 fuses • Upgrading/replacing 37 transformers • Installing 20 lightning arresters • Installing 278 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work was completed in 4th quarter of 2014.
8	15130	• Upgrading approximately 504 feet of primary tree wire • Upgrading approximately 22,993 feet of secondary wire • Upgrading approximately 22,703 feet of bare wire • Upgrading/replacing approximately 82 poles • Upgrading/replacing approximately 103 transformers • Upgrading/replacing approximately 4 gang switches • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 1,160 feet of primary tree wire • Upgrading 22,352 feet of secondary wire • Upgrading 3,332 feet of bare wire • Upgrading/replacing 68 poles • Upgrading/replacing 65 cross arms • Upgrading/replacing 1 ACR • Upgrading/replacing 4 manual switches • Upgrading/replacing 164 fuses • Upgrading/replacing 73 transformers • Installing 28 lightning arresters • Installing 403 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work was completed in 4th quarter of 2014.
9	15021	• Upgrading approximately 164 feet of secondary wire • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 80 feet of secondary wire • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work was completed in 3rd quarter of 2014.
10	15171	• Upgrading approximately 2,060 feet of secondary wire • Upgrading approximately 7,446 feet of bare wire • Upgrading/replacing approximately 38 poles • Upgrading/replacing approximately 25 transformers • Upgrading/replacing approximately 2 ACRs • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 797 feet of primary tree wire • Upgrading 2,000 feet of secondary wire • Upgrading 5,658 feet of bare wire • Upgrading/replacing 58 poles • Upgrading/replacing 99 cross arms • Upgrading/replacing 1 ACR • Upgrading/replacing 15 manual switches • Upgrading/replacing 95 fuses • Upgrading/replacing 72 transformers • Installing 18 lightning arresters • Installing 316 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work was completed in 4th quarter of 2014.
11	15009	This feeder was a Priority feeder in 2012 and the work was completed in 1st Quarter 2014. No additional work was proposed.	2012 Priority Feeder work completed in 1st quarter 2014: • Upgrading 16,603 feet of primary treewire • Upgrading 64,225 feet of secondary wire • Upgrading/replacing 279 poles • Upgrading/replacing 69 cross arms • Upgrading/replacing 1 gang switch • Upgrading/replacing 1 manual switch • Upgrading/replacing 117 fuses • Upgrading/replacing 77 transformers • Installing 55 lightning arresters • Installing 223 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	This work was completed in 1st quarter of 2014.
12	14753	• Upgrading approximately 11,968 feet of secondary wire • Upgrading approximately 3,315 feet of bare wire • Upgrading/replacing approximately 23 poles • Upgrading/replacing approximately 4 transformers • Upgrading/replacing approximately 3 ACRs • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 442 feet of primary tree wire • Upgrading 12,683 feet of secondary wire • Upgrading 2,693 feet of bare wire • Upgrading/replacing 45 poles • Upgrading/replacing 69 cross arms • Upgrading/replacing 1 gang switch • Upgrading/replacing 25 transformers • Upgrading/replacing 3 ACRs • Installing 16 lightning arresters • Installing 198 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work was completed in 4th quarter of 2014.

2014 2% Priority Feeder Program - District of Columbia - Corrective Actions Proposed vs. Completed/ Pending Completion				
Rank	**Feeder**	**Proposed Corrective Actions, as filed in the 2014 Consolidated Report**	**Detailed Corrective Actions - Completed/ Pending Completion**	**Explanation of Variances/ Comments**
13	15173	• Upgrading approximately 80 feet of secondary wire • Upgrading/replacing approximately 1 ACR • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 84 feet of secondary wire • Upgrading/replacing 1 ACR • Upgrading/replacing 1 pole • Upgrading/replacing 1 cross arm • Upgrading/replacing 1 transformer • Installing 24 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work was completed in 3rd quarter of 2014.
14	15867	• Upgrading approximately 4,324 feet of secondary wire • Upgrading approximately 541 feet of bare wire • Upgrading/replacing approximately 75 poles • Upgrading/replacing approximately 35 transformers • Upgrading/replacing approximately 4 ACRs • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 505 feet of primary tree wire • Upgrading 3,935 feet of secondary wire • Upgrading 3,042 feet of bare wire • Upgrading/replacing 3 ACRs • Upgrading/replacing 1 gang switch • Upgrading/replacing 46 poles • Upgrading/replacing 49 cross arms • Upgrading/replacing 54 fuses • Upgrading/replacing 32 transformers • Installing 17 lightning arresters • Installing 170 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	The proposed corrective actions were based on high level inspection. Additional opportunities to improve system reliability were identified based on further detailed field inspection. This work was completed in 4th quarter of 2014.
15	212	• Upgrading/replacing approximately 20 transformers • Performing inspection of underground oil switches, including cables and fuse boxes • Performing inspection of tap modules.	• Upgrading/replacing 9 transformers • Performing inspection of underground oil switches, including cables and fuse boxes • Performing inspection of tap modules.	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work was completed in 4th quarter of 2014.
16	53	• Upgrading/replacing approximately 15 transformers • Performing inspection of underground oil switches, including cables and fuse boxes • Performing inspection of tap modules.	• Upgrading/replacing 4 transformers • Performing inspection of underground oil switches, including cables and fuse boxes • Performing inspection of tap modules.	The proposed corrective actions were based on high level inspection. However, corrective actions were further defined following a detailed field investigation. This work is currently in Construction and scheduled for completion in 1st quarter of 2015.
17	CPI-00177	• Upgrading approximately 5,320 feet of secondary wire • Upgrading/replacing approximately 7 poles • Upgrading/replacing approximately 3 transformers • Upgrading/replacing approximately 1 gang switch • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	• Upgrading 5,108 feet of secondary wire • Upgrading/replacing 8 poles • Upgrading/replacing 10 cross arms • Upgrading/replacing 5 fuses • Upgrading/replacing 3 animal guards • Performing thermal vision of overhead facilities and necessary upgrades • Performing inspection and tree trimming in accordance with the EIVM Plan	This work is currently in Construction and scheduled for completion in 1st quarter of 2015. In addition, this feeder is being converted to a 13kV feeder 15177, which is a 1st year DC PLUG feeder.

Table 2.4-A

Proposed Corrective Actions for 2015 Priority Feeders and CPI-Selected Feeders[45]

The following information provides an overview of the outages and proposed corrective actions for the 2015 Priority Feeders and the CPI-Selected Feeder and detailed information regarding the equipment related events.

Pepco's OMS assigns event numbers based on length of time between interruptions. Therefore, during the trouble locating and restoration process, more than one event number may be generated and counted. For the sections explains equipment failures, for mainline feeders, line fuses and transformers, the events were grouped by incidents.

* The Other category includes: Contractor, Employee, Equipment Hit, Load Shed, Salt, Secondary, Source, Tap, Vandalism etc.

[45] Actual equipment failures may be more or less than the number shown because a single event may give rise to more than one equipment failure and due to OMS limitations that do not allow a single unique case to be identified in each line.

2015 Priority Feeders

1 - Feeder 00211

This feeder was not a 2% Priority Feeder previously.

2015 Priority Feeder- Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 9
Total number of customer interruptions during Non-Major Event Days = 4,726

- Mainline events contributed to 100% of the total number of events, which accounted for 100% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 6 – Equipment Failure
- 3 – Unknown

The 6 equipment failures occurred as the result of the following 6 incidents: 4 cable failures and 2 joint failures.

Corrective Actions Addressed by the Feeder Program:

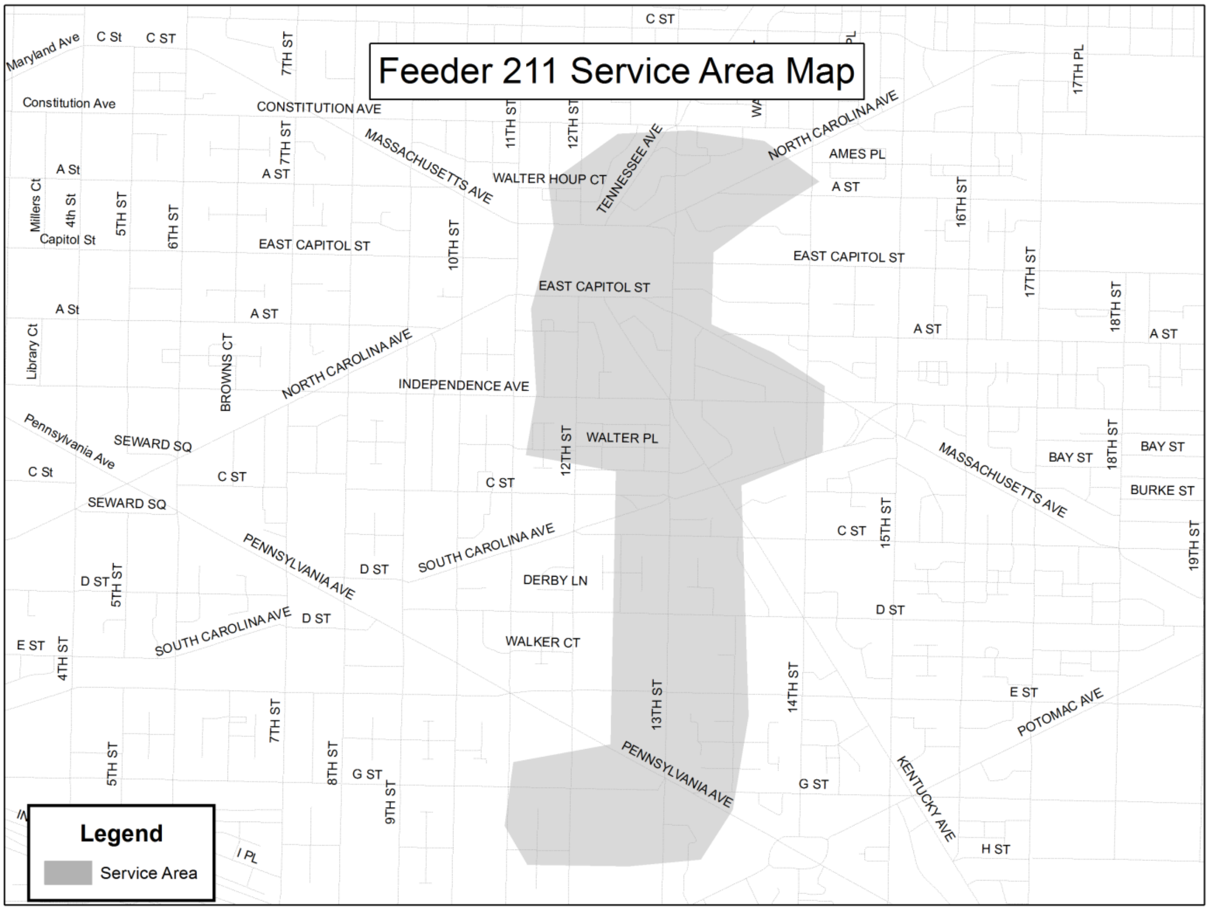
Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 3 Transformers
  - 10 Joints
  - 10 elbows

The work locations include:
Independence Avenue and Kentucky Avenue

Total Project Cost Estimate: $274,392

2015 Cash Flow: $274,392



2 - Feeder 00076

This Feeder was a 2% Priority Feeder in 2011.

Feeder 76 - Year 2011 - 2015 (IEEE MED Exclusive)					
Year	2011	2012	2013	2014	2015

Priority Feeder in 2011

Description of Major Event Exclusive Outages (October 1, 2009 through September 30, 2010):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 19
Total number of customer interruptions during Non-Major Event Days = 2,942

- Mainline events contributed to 42% of the total number of events, which accounted for 86% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 6 – Equipment Failure
- 2 – Other*

The 6 equipment failures occurred as the result of the following 6 incidents: 3 joint failures, 1 cable failure, 1 switch failure, and 1 transformer failure.

- Localized transformer events contributed to 58% of the total number of events, which accounted for 14% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 8 – Equipment Failure
- 2 – Load
- 1 – Other*

The 8 equipment failures occurred as the result of the following 8 incidents: 4 cable failures, 2 joint failures, 1 transformer failure, and 1 service cable failure.

Corrective actions performed in 2011:

Performed primary and/or secondary cable replacement, performed Very Low Frequency (VLF) cable testing, performed substation relay tests; performed load studies on remaining transformers, and secondary cable, upgrading as necessary.

Analysis of Past Corrective Actions

The scope of work of the previous corrective actions did not solve the incidents caused by deteriorating infrastructure. Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder – Analysis and Corrective Actions:

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 11
Total number of customer interruptions during Non-Major Event Days = 2,129

- Mainline events contributed to 73% of the total number of events, which accounted for 93% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 8 – Equipment Failure

The 8 equipment failures occurred as the result of the following 8 incidents: 7 cable failures and 1 burned switch.

- Localized transformer events contributed to 27% of the total number of events, which accounted for 7% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 3 - Equipment Failure

The 3 equipment failures occurred as the result of the following 3 incidents: 2 cable failures and 1 joint failure.

Corrective Actions Addressed by the Priority Feeder Program:

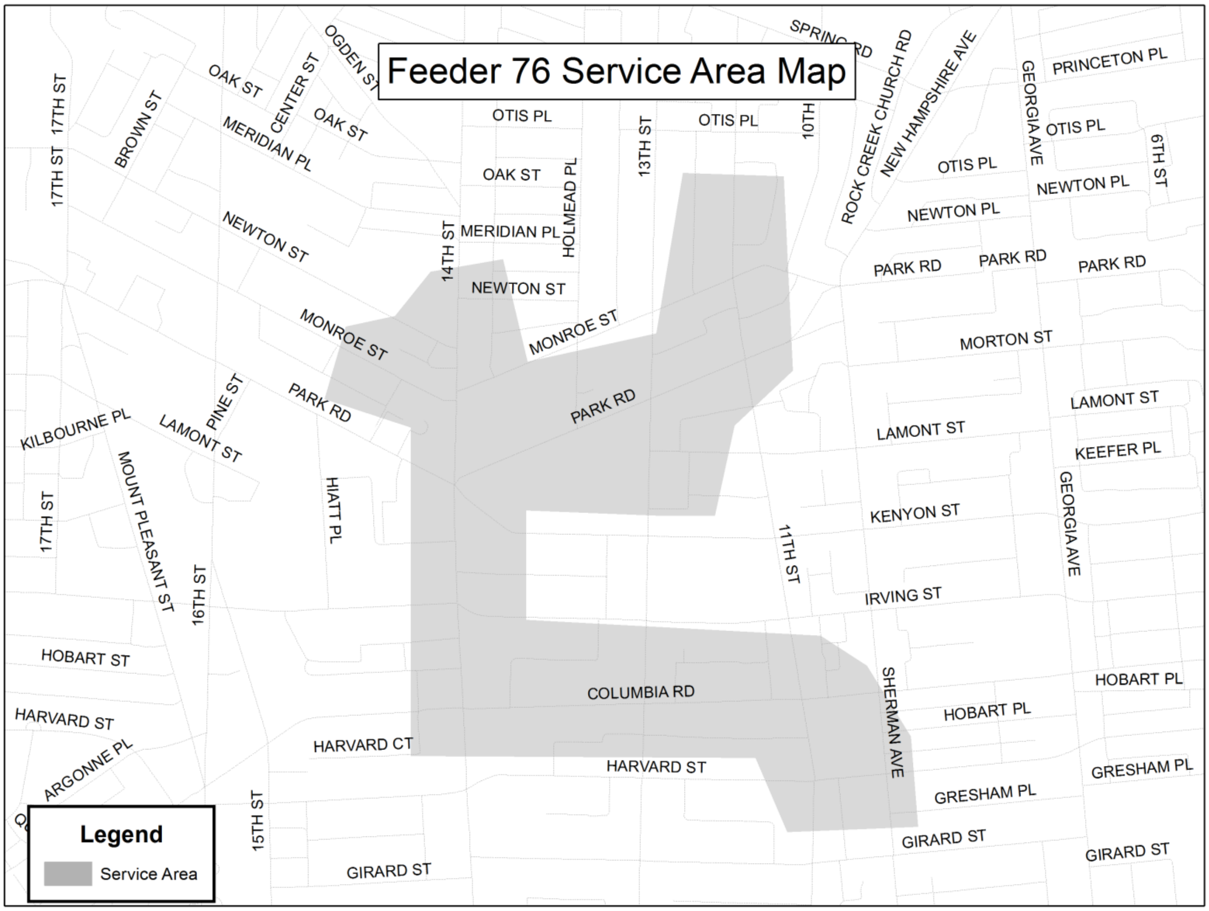
This feeder is scheduled for 4kV to 13kV conversion during 2015. As part of the conversion project, the following work is proposed for this year:

- Install approximately:
  - 5,700 feet of conduit
  - 22 new tap holes
  - 2 oil switches
  - 10,500 feet of underground cable
  - 35 transformers

The work locations include:
Monroe Street, 14^{th} Street, Park Road and 11^{th} Street

Total Project Cost Estimate: $2,000,000

2015 Cash Flow: $2,000,000



3 - Feeder 15174

This feeder was a 2% Priority Feeder in 2010 and 2013.

Feeder 15174 - Year 2010 - 2015 (IEEE MED Exclusive)						
Year	2010	2011	2012	2013	2014	2015

NI	17	16	19	19	22	9

Priority Feeder in 2010

Description of Major Event Exclusive Outages (October 1, 2008 through September 30, 2009):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 17
Total number of customer interruptions during Non-Major Event Days = 4,872

- Mainline events contributed to 18% of the total number of events, which accounted for 93% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 - Unknown
- 2 - Tree

- Fuse events contributed to 6% of the total number of events, which accounted for 2% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 - Unknown

- Localized transformer events contributed to 76% of the total number of events, which accounted for less than 5% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 4 - Equipment Failure
- 4 – Tree
- 2 - Animal
- 1 – Weather
- 2 – Unknown

The 4 equipment failures occurred as the result of the following 4 incidents: 1 failed transformer, and 3 cable failures.

Corrective actions performed in 2010:
Replaced/Installed 29 cross arms, and 30 animal guards. Installed 3 SF6 and 1 manual operated gang operated switch. Performed thermal vision inspection of overhead facilities. No problems were identified. Performed tree trimming.

Priority Feeder in 2013

Description of Major Event Exclusive Outages (October 1, 2011 through September 30, 2012):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 20
Total number of customer interruptions during Non-Major Event Days = 7,238

- Mainline events contributed to 15% of the total number of events, which accounted for 97% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 - Equipment Failure
- 1 – Tree
- 1 – Other*

The 1 equipment failure occurred as the result of the following incident: a wire down due to loose jumper.

- Fuse events contributed to 10% of the total number of events, which accounted for 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 - Equipment Failure
- 1 - Other*

The 1 equipment failure occurred as the result of the following incident: 1 cable failure.

- Localized transformer events contributed to 75% of the total number of events, which accounted for 2% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 3 - Unknown
- 3 – Equipment Failure
- 3 - Animal
- 1 – Tree
- 5 – Other*

The 3 equipment failures occurred as the result of the following 3 incidents: 2 secondary connections burnt off and 1 faulty transformer.

Corrective actions performed in 2013:

Replaced/Installed 3,934 feet of primary tree wire, 11,389 feet of primary bare wire, 5,156 feet of mainline secondary, 16 poles, 24 cross arms, 20 fuse cutouts, 19 transformers, 6 lightning arrestors, and 55 animal guards.

Analysis of Past Corrective Actions

Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder- Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 9
Total number of customer interruptions during Non-Major Event Days = 4,616

- Mainline events contributed to 33% of the total number of events, which accounted for 98% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 2 – Unknown
- 1 – Weather

- Fuse events contributed to 11% of the total number of events, while accounting for less than 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 – Equipment Failure

The 1 equipment failure occurred as the result of the following incident: 1 blown cutout.

- Localized transformer events contributed to 56% of the total number of events, which accounted for 2% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 1 - Equipment Failure
- 1 – Weather
- 2 – Animal
- 1 – Unknown

The 1 equipment failure occurred as the result of the following incident: 1 overloaded transformer.

Corrective Actions Addressed by the Priority Feeder Program:

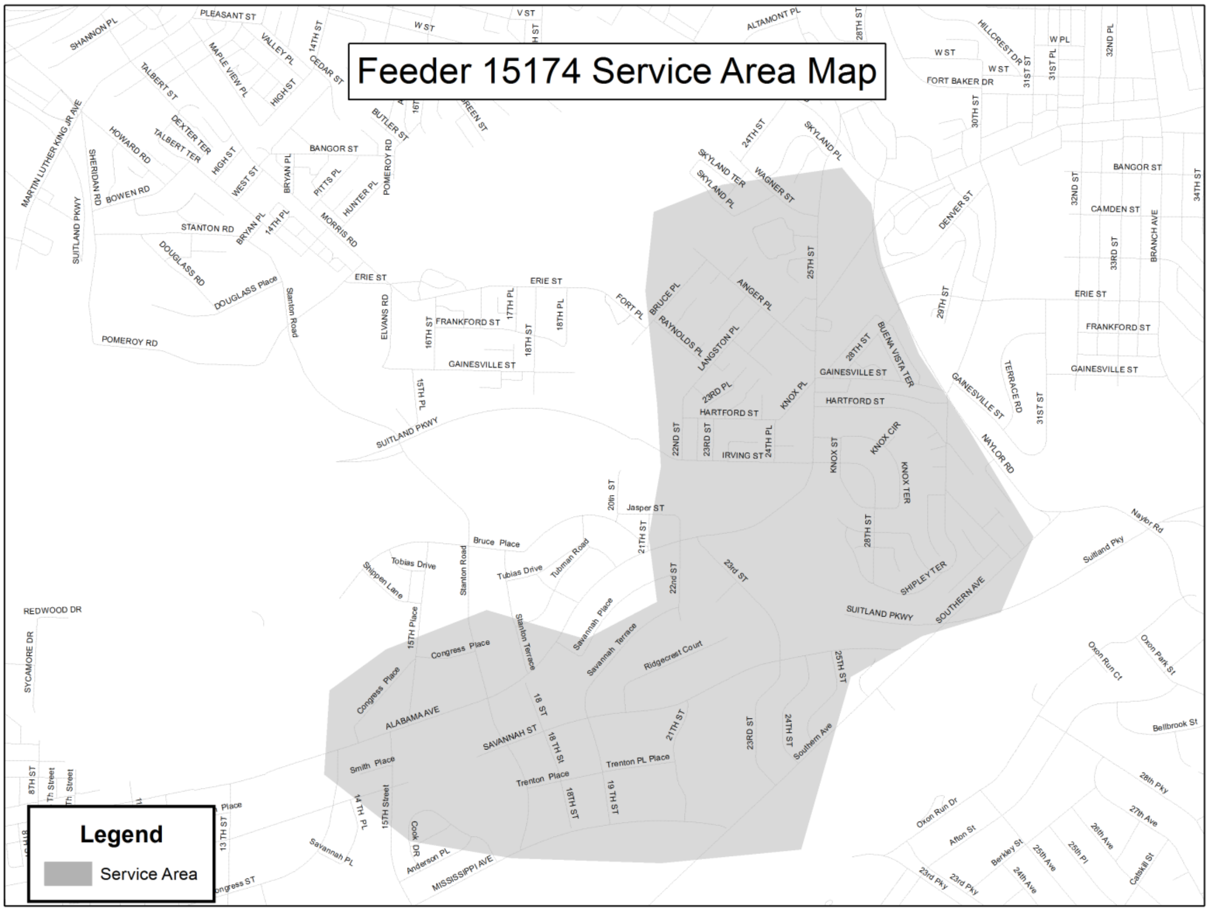
Review of the outage history, feeder map and past corrective actions identified the following option for consideration:

- ❖ Install/replace approximately:
  - 300 Animal Guards
  - 15 Cross Arms
  - 10 Transformers
  - 5 poles
- ❖ Perform inspection and tree trimming in accordance with the VM Plan
- ❖ Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Savanah Street, Anger Place, Ridgecrest Road, Stanton Road, 23rd Street, 25th Street, Alabama Avenue SE, Hartford Street, Buena Vista Terrace, Shipley Terrace and Trenton Place

Total Project Cost Estimate: $301,830

2015 Cash Flow: $301,830



4 - Feeder 15701

This feeder was a 2% Priority Feeder in 2003, 2005, 2010.

Feeder 15701 - Year 2001 - 2015 (IEEE MED Exclusive)											
Year	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015

<u>Priority Feeder in 2003</u>

Description of Major Event Exclusive Outages (October 1, 2001 through September 30, 2002):

Data is unavailable

Corrective actions performed in 2003:

Performed manhole inspections - no problems found, installed 2 animal guards, 1 fuse, re-tensioned wires at 1 location, replaced 2 cross-arms, transferred load, replaced 2 transformers.

Priority Feeder in 2005

Description of Major Event Exclusive Outages (October 1, 2003 through September 30, 2004):

Data is unavailable

Corrective actions performed in 2005:

Install/Replace 2 cross arms, 13 fuse cutouts, 3 lightning arrestors, and 6 animal guards.

Priority Feeder in 2010

Description of Major Event Exclusive Outages (October 1, 2008 through September 30, 2009):

Total number of events during Non-Major Event Days (Major Event Exclusive) =37
Total number of customer interruptions during Non-Major Event Days = 6,171

- Mainline events contributed to 2% of the total number of events, which accounted for 78% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Unknown

- Localized transformer events contributed to 98% of the total number of events, which accounted for 22% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 8 - Equipment Failure
- 1 – Animal
- 1 - Employee
- 1 - Tree
- 3 – Weather
- 7 – Load
- 12 – Unknown
- 3 - Other*

The 8 equipment failures occurred as the result of the following 8 incidents: 4 cable failures, 2 meter box failure, 1 failed transformer and 1 failed fuse.

Corrective actions performed in 2010:

Install/Replace 47 feet of primary tree wire, 1 ACR, 6 lightning arrestors, and 18 animal guards.

Analysis of Past Corrective Actions

The scope of work of the previous corrective actions did not solve the incidents caused by deteriorating infrastructure. Past corrective actions did not adequately address all of the reliability issues on this feeder.

<u>2015 Priority Feeder – Analysis and Corrective Actions</u>

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 30
Total number of customer interruptions during Non-Major Event Days = 3,990

- Mainline events contributed to 13% of the total number of events, which accounted for 76% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure
- 3 – Animal

The 1 equipment failure occurred as the result of the following incident: 1 transformer failure.

- Fuse events contributed to 17% of the total number of events, which accounted for 15% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 2 – Equipment Failure
- 2 – Animal
- 1 – Other*

The 2 equipment failures occurred as the result of the following 2 incidents: 1 cable failure and 1 blown fuse.

- Localized transformer events contributed to 70% of the total number of events, which accounted for 9% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 14 - Equipment Failure
- 1 – Employee
- 2 – Unknown
- 1 – Load
- 3 – Other*

The 14 equipment failures occurred as the result of the following 14 incidents: 7 cable failures, 1 loose secondary connection, 1 burned cutout, 2 joint failures, 2 meter failures, and 1 burned service.

Corrective Actions Addressed by the Priority Feeder Program:

Review of the outage history, feeder map and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 496 feet of primary wire
  - 2,448 feet of bare wire
  - 4,979 feet of secondary wire
  - 18 poles
  - 32 cross arms
  - 77 fuses
  - 17 transformers
  - 16 lightning arresters
  - 219 animal guards

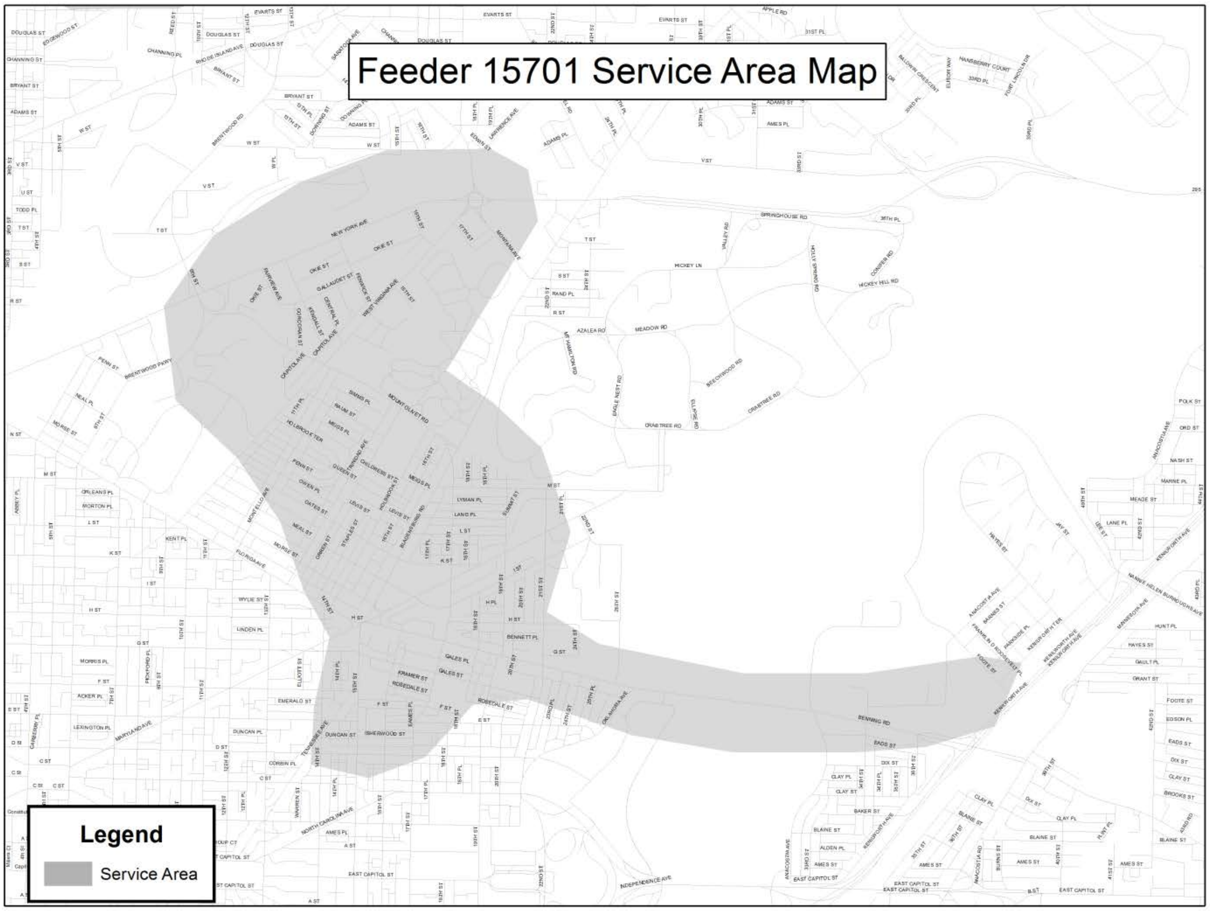
- Perform inspection and tree trimming in accordance with the VM Plan

- Perform thermal vision of overhead facilities and necessary upgrades.

The work locations include:
Mount Olivet Road, Corcoran Street, Kendall Street, Providence Street, Central Place, Fenwick Street, Gallaudet Street, Okie Street, West Virginia Avenue and Fairview Street.

Total Project Cost Estimate: $284,797

2015 Cash Flow: $284,797



5 - Feeder 14722

This feeder was not a 2% Priority Feeder previously.

Feeder 14722 - Year 2015 (IEEE MED Exclusive)

NI	13

2015 Priority Feeder- Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 13
Total number of customer interruptions during Non-Major Event Days = 3,459

- Mainline events contributed to 31% of the total number of events, which accounted for 92% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- ➢ 4 – Equipment Failure

The 4 equipment failures occurred as the result of the following 4 incidents: 2 blown joints and 2 failed switches.

- Localized transformer events contributed to 69% of the total number of events, which accounted for 8% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- ➢ 6 - Equipment Failure
- ➢ 1 – Employee
- ➢ 1 – Fire
- ➢ 1 – Load

The 6 equipment failures occurred as the result of the following 6 incidents: 4 cable failures, 1 transformer failure and 1 broken meter.

Corrective Actions Addressed by the Feeder Program:

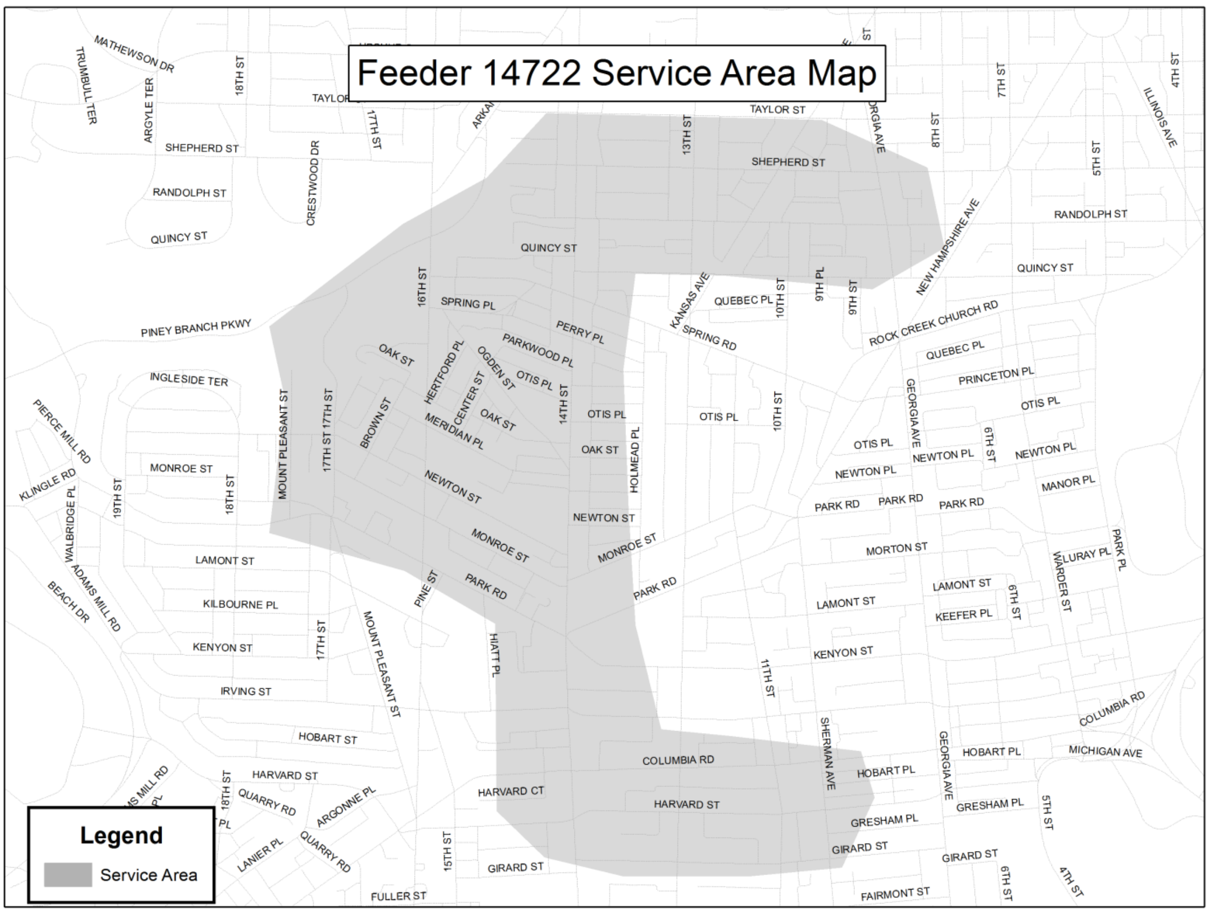
Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- ❖ Install/replace:
  - 1 transformer
  - 1 manhole
- ❖ Perform inspection of underground oil switches, including cables and fuse boxes
- ❖ Perform inspection of tap modules
- ❖ Perform Very Low Frequency (VLF) cable testing as appropriate to identify necessary repairs and upgrades

The work locations include:
Kansas Avenue NW and Randolph Street NW.

Total Project Cost Estimate: $41,489

2015 Cash Flow: $41,489



6 - Feeder 15170

This feeder was a 2% Priority Feeder in 2006 and 2010.

Feeder 15170 - Year 2006 - 2015 (IEEE MED Exclusive)										
Year	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015

Priority Feeder in 2006

Description of Major Event Exclusive Outages (October 1, 2004 through September 30, 2005):

Data is unavailable

Corrective actions performed in 2006:

Install/replace 6 lightning arresters and 4 animal guards

Priority Feeder in 2010

Description of Major Event Exclusive Outages (October 1, 2008 through September 30, 2009):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 24
Total number of customer interruptions during Non-Major Event Days = 9,112

- Mainline events contributed to 33% of the total number of events, which accounted for 95% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 5 – Trees
- 3 – Weather

- Fuse events contributed to 4% of the total number of events, which accounted for 2% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure

This 1 equipment failure occurred as a result of the following incident: 1 failed cable.

- Localized transformer events contributed to 63% of the total number of events, which accounted for 4% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 6 – Equipment Failure
- 2 – Trees
- 3 – Unknown
- 4 – Other*

The 6 equipment failures occurred as the result of the following 6 incidents: 5 service cable failures and 1 transformer failure.

Corrective actions performed in 2010:

Install/Replace 2,078 feet of primary tree wire, 3,006 feet of mainline secondary wire, 950 feet of secondary service wire, 9 poles, 9 cross arms, 1 fuse cutout, 3 transformers, 6 lightning arrestors, and 27 animal guards.

Analysis of Past Corrective Actions

Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder – Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 22
Total number of customer interruptions during Non-Major Event Days = 4,202

- Mainline events contributed to 9% of the total number of events, which accounted for 78% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure
- 1 – Weather

The 1 equipment failure occurred as the result of the following incident: 1 cable failure

- Fuse events contributed to 32% of the total number of events, which accounted 16% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 6 – Equipment Failure
- 1 – Animal

The 6 equipment failure occurred as the result of the following 6 incidents: 6 cable failures.

- Localized transformer events contributed to 59% of the total number of events, which accounted for 6% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 13 – Equipment Failure

The 13 equipment failures occurred as the result of the following 13 incidents: 9 cable failures, 2 service cable failures, 1 fuse cutout failure, and 1 loose connection.

Corrective Actions Addressed by the Feeder Program:

Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 423 feet of primary tree wire
  - 875 feet of mainline secondary
  - 95 feet of secondary service wire
  - 11 poles
  - 3 cross arms
  - 47 fuse cutouts
  - 15 transformers
  - 210 animal guards

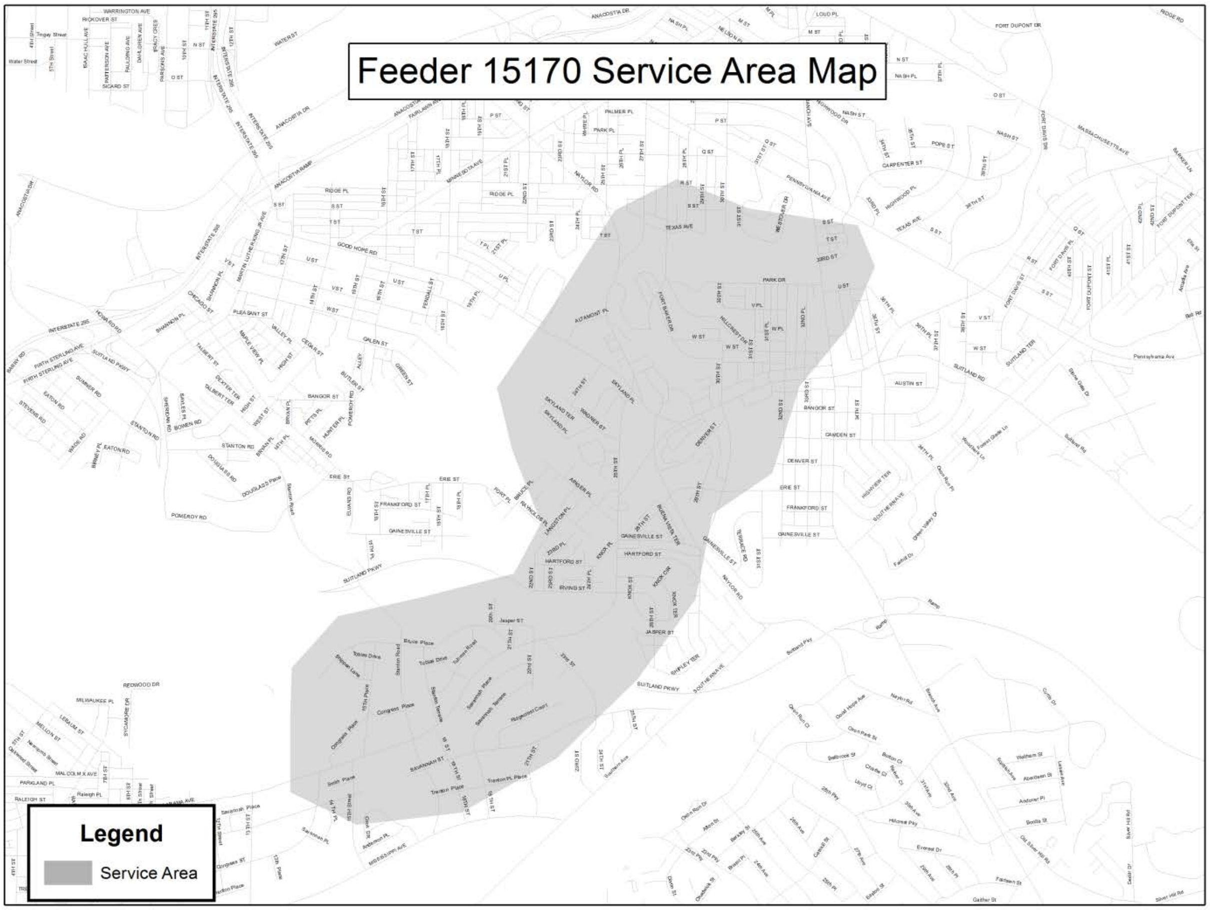
- Perform inspection and tree trimming in accordance with the VM Plan

- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Alabama Avenue, 25th Street, Naylor Road, Good Hope Road, Denver Street, 30th Street, Wagner Street SE, Skyland Place SE, Skyland Terrace SE, 24th Street SE, 29th Street SE, Akron Place SE, Fort Baker Drive SE and W Street SE

Total Project Cost Estimate: $359,807

2015 Cash Flow: $359,807



7 - Feeder 14006

Priority Feeder in 2002

Description of Major Event Exclusive Outages (October 1, 2000 through September 30, 2001):

Data is unavailable

Corrective actions performed in 2002:

Replace/installed 26 fuses and performed tree trimming.

Priority Feeder in 2013

Description of Major Event Exclusive Outages (October 1, 2011 through September 31, 2012):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 48
Total number of customer interruptions during Non-Major Event Days = 4,370

- Mainline events contributed to 6% of the total number of events, which accounted for 72% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 - Equipment Failure
- 1 – Weather
- 1 - Tree

The 1 equipment failure occurred as the result of the following incident: a burnt switch.

- Fuse events contributed to 15% of the total number of events, which accounted for 18% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 - Equipment Failure
- 3 – Tree
- 3 - Weather

The 1 equipment failure occurred as the result of the following incident: a defective cutout.

- Localized transformer events contributed to 79% of the total number of events, which accounted for 10% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 9 - Equipment Failure
- 12 – Tree
- 6 - Animal
- 3 - Other*
- 2 – Load
- 4 – Weather

- 2 – Unknown

The 9 equipment failures occurred as the result of the following 9 incidents: 2 loose/open secondary connections, 2 secondary services off, 1 fuse burnout, 1 transformer failure, 2 wire failures and 1 burnt meter box.

Corrective actions performed in 2013:

Replaced/Installed 186 feet of primary tree wire, 1,500 feet of mainline secondary, 1,963 feet of secondary service, 16 poles, 9 cross arms, 1 gang switch, 6 fuse cutouts, 6 transformers, 6 lightning arrestors, and 29 animal guards.

Analysis of Past Corrective Actions

Past corrective actions did not adequately address all of the reliability issues on this feeder.

<u>2015 Priority Feeder – Analysis and Corrective Actions</u>

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 18
Total number of customer interruptions during Non-Major Event Days = 4,234

- Mainline events contributed to 11% of the total number of events, which accounted for 92% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Animal
- 1 – Unknown

- Fuse events contributed to 17% of the total number of events, while accounting for less than 3% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 – Equipment Failure
- 1 – Tree
- 1 - Animal

The 1 equipment failure occurred as the result of the following 1 incident: 1 blown lighting arrestor.

- Localized transformer events contributed to 72% of the total number of events, which accounted for 5% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 5 - Equipment Failure
- 4 – Tree
- 2 – Animal
- 1 – Load
- 1 – Other*

The 5 equipment failures occurred as the result of the following 5 incidents; 1 loose/open secondary connections, 1 burnt tap, 1 burnt splice, 1 failed transformer and 1 blown cutout.

Corrective Actions Addressed by the Feeder Program:

Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 3,150 feet of secondary wire
  - 340 Animal guards
  - 9 poles
  - 2 Cross Arms

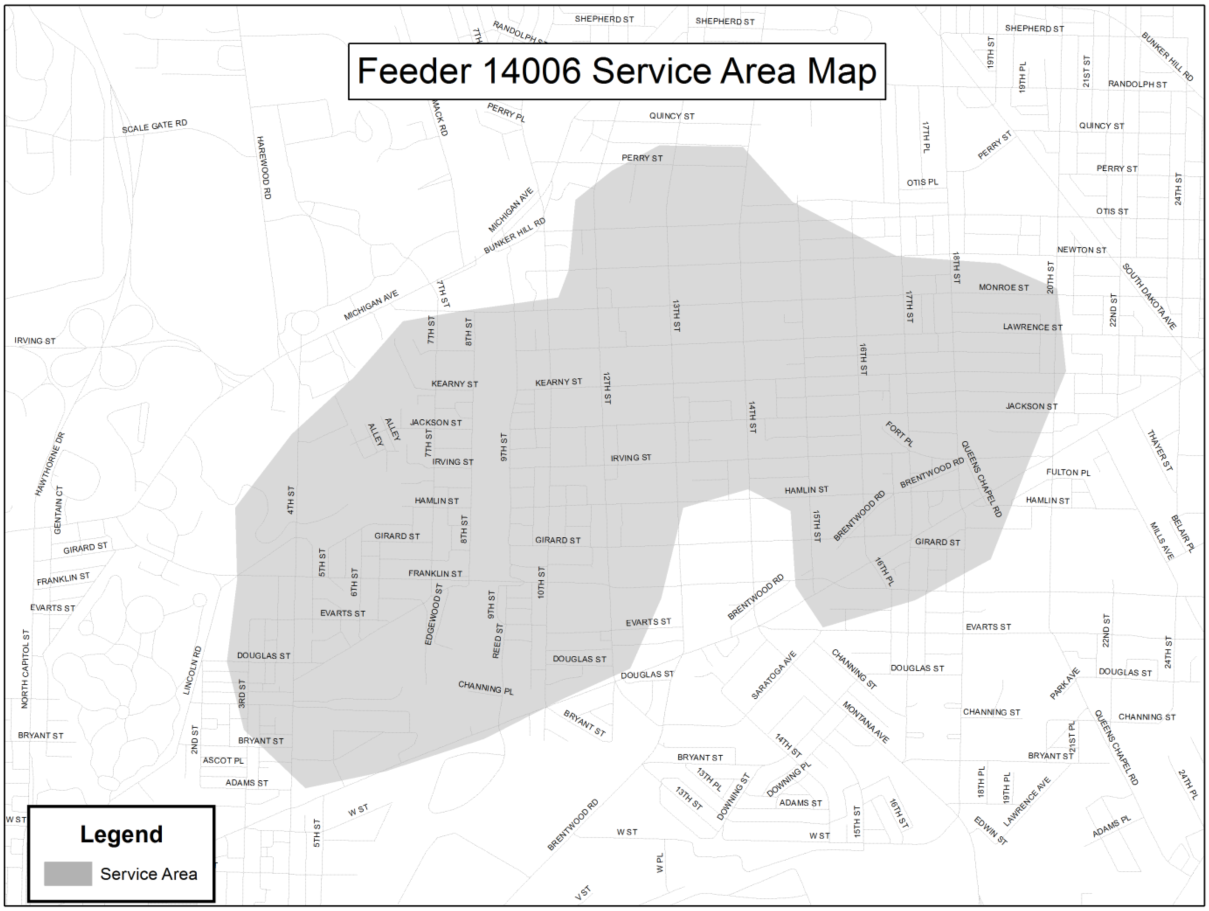
- Perform inspection and tree trimming in accordance with the VM Plan

- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
4TH Street, 6th Street, 7th Street, 10th Street, 12th Street, 13th Street, 14th Street, 15th Street, 16th Street, 17th Street, 18th Street, Brentwood Road, Edgewood Street, Evarts Street, Franklin Street, Girard Street, Hamlin Street, Irving Street, Jackson Street, Kearny Street, Lawrence Street, Monroe Street, Newton Street and Otis Street.

Total Project Cost Estimate: $428,514

2015 Cash Flow: $428,514



8 - Feeder 15014

This feeder was a 2% Priority Feeder in 2009 and 2012.

Feeder 15014 - Year 2009 - 2015 (IEEE MED Exclusive)

<u>Priority Feeder in 2009</u>

Description of Major Event Exclusive Outages (October 1, 2007 through September 31, 2008):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 21
Total number of customer interruptions during Non-Major Event Days = 4,368

- Mainline events contributed to 14% of the total number of events, which accounted for 77% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 - Weather
- 2 – Unknown

- Fuse events contributed to 10% of the total number of events, which accounted for 19% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 1 – Tree
- 1 – Unknown

- Localized transformer events contributed to 76% of the total number of events, which accounted for 4% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 5 - Equipment Failure
- 1 – Load
- 1 – Animal
- 4 – Other*
- 5 – Unknown

The 5 equipment failures occurred as the result of the following 5 incidents: 1 burned fuses and 4 failed transformers.

Corrective actions performed in 2009:

Replaced/Installed 16 lightning arresters, 32 animal guards, 4 cross arms, 2 radios, 2 SF6 switches, and 144’ of tree wire.

Priority Feeder in 2012

Description of Major Event Exclusive Outages (October 1, 2010 through September 31, 2011):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 16
Total number of customer interruptions during Non-Major Event Days = 5,365

- Mainline events contributed to 31% of the total number of events, which accounted for 95% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 3 - Equipment Failure
- 1 - Unknown
- 1 - Weather

The 3 equipment failures occurred as the result of the following 1 incident: 1 rotten pole

- Fuse events contributed to19% of the total number of events, which accounted for 4% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 2 – Animal
- 1 – Weather

- Localized transformer events contributed to 50% of the total number of events, which accounted for 1% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 2 - Equipment Failure
- 1 - Unknown
- 1 – Foreign Contact
- 1 - Weather
- 2 - Animal
- 1 - Other*

The 2 equipment failures occurred as the result of the following 2 incidents: 1 secondary bare wire failure and 1 burned cutout.

Corrective actions performed in 2012:

Install/Replace 18,062 feet of primary tree wire, 709 feet of primary bare wire, 15,709 feet of mainline secondary, 25,099 feet of secondary service, 132 poles, 59 cross arms, 130 fuse cutouts, 100 transformers, 4 lightning arrestors, and 265 animal guards.

Analysis of Past Corrective Actions

Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder – Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 13
Total number of customer interruptions during Non-Major Event Days = 3,662

- Mainline events contributed to 31% of the total number of events, which accounted for 95% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure
- 1 – Unknown
- 2 – Tree

The 1 equipment failure occurred as the result of the following incident: 1 loose connection.

- Fuse events contributed to 15% of the total number of events, which accounted for 4% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 – Tree
- 1 – Other*

- Localized transformer events contributed to 54% of the total number of events, which accounted for 1% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 1 - Equipment Failure
- 1 – Tree
- 4 – Animal
- 1 – Other*

The 1 equipment failure occurred as the result of the following incident: 1 broken meter.

Corrective Actions Addressed by the Priority Feeder Program:

Review of the outage history, feeder map and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 714 feet of bare wire
  - 1,320 feet of secondary wire
  - 7 poles
  - 13 transformers
  - 1 gang switch

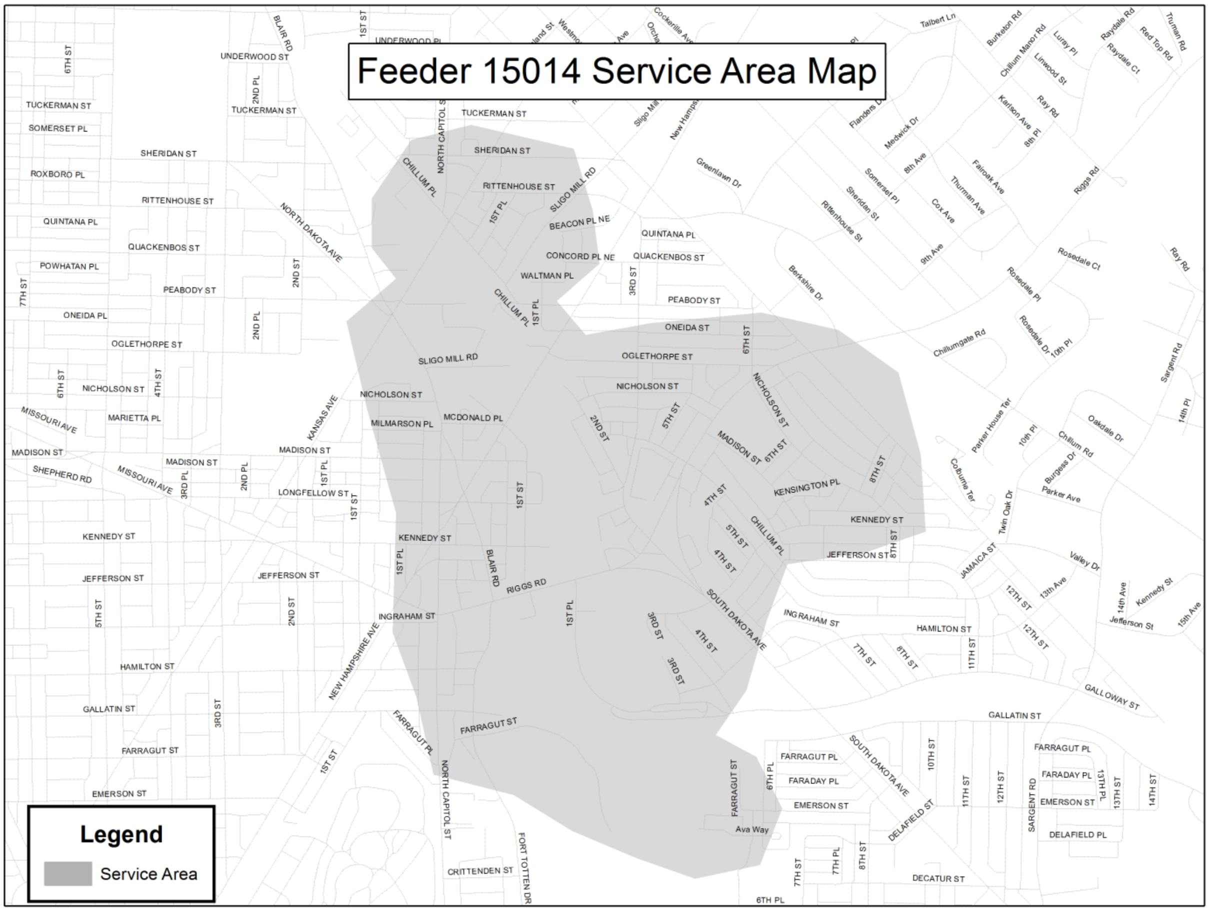
- Perform inspection and tree trimming in accordance with the VM Plan

- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Oglethorpe Street, Madison Street, Nicholson Street, Kensington Place, Chillum Place, First Place, Sligo Mill Road, Farragut Street, Kennedy Street, Rock Creek Road and Riggs Road

Total Project Cost Estimate: $304,123

2015 Cash Flow: $304,123



9 - Feeder 14702

This feeder was not a 2% Priority Feeder previously.

Feeder 14702 - Year 2015 (IEEE MED Exclusive)	
Year	2015
SAIFI	3.25
SAIDI	4.73
CHI	4,966
NI	17

2015 Priority Feeder – Analysis and Corrective Actions:

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 17
Total number of customer interruptions during Non-Major Event Days = 3,409

- Mainline events contributed to 23% of the total number of events, which accounted for 95% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:
- 1 - Equipment Failure
- 3 - Weather

The 1 equipment failure occurred as a result of the following incident: 1 pole down

- Fuse events contributed to 12% of the total number of events, which accounted for less than 1% of the total number of customer interruptions.

In summary, the causes for the fuse events were as follows:
- 2 – Equipment Failure

The 2 equipment failures occurred as a result of the following 2 incidents: 1 loose connection and 1 damaged fuse holder.

- Localized transformer events contributed to 65% of the total number of events, which accounted for 5% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 6 - Equipment Failure
- 1 - Weather
- 1 – Overload
- 1 – Animal
- 2 - Unknown

The 6 equipment failures occurred as the result of the following 6 incidents: 3 burnt fuse, 1 loose connection, 1 transformer lead burnt, and 1failed meter.

Corrective Actions Addressed by the Priority Feeder Program:

Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/ replace approximately:
  - 275ft Primary tree wire
  - 7,268ft Primary bare wire
  - 742ft Secondary Triplex wire
  - 412ft Secondary Service Triplex wire
  - 27 Poles
  - 1 ACR
  - 3 Gang Switches
  - 3 Transformers

- 1 Capacitor
- 35 Cutouts
- 90 Lightning Arrestors
- 318 Animal Guards
- 88 Cross arms

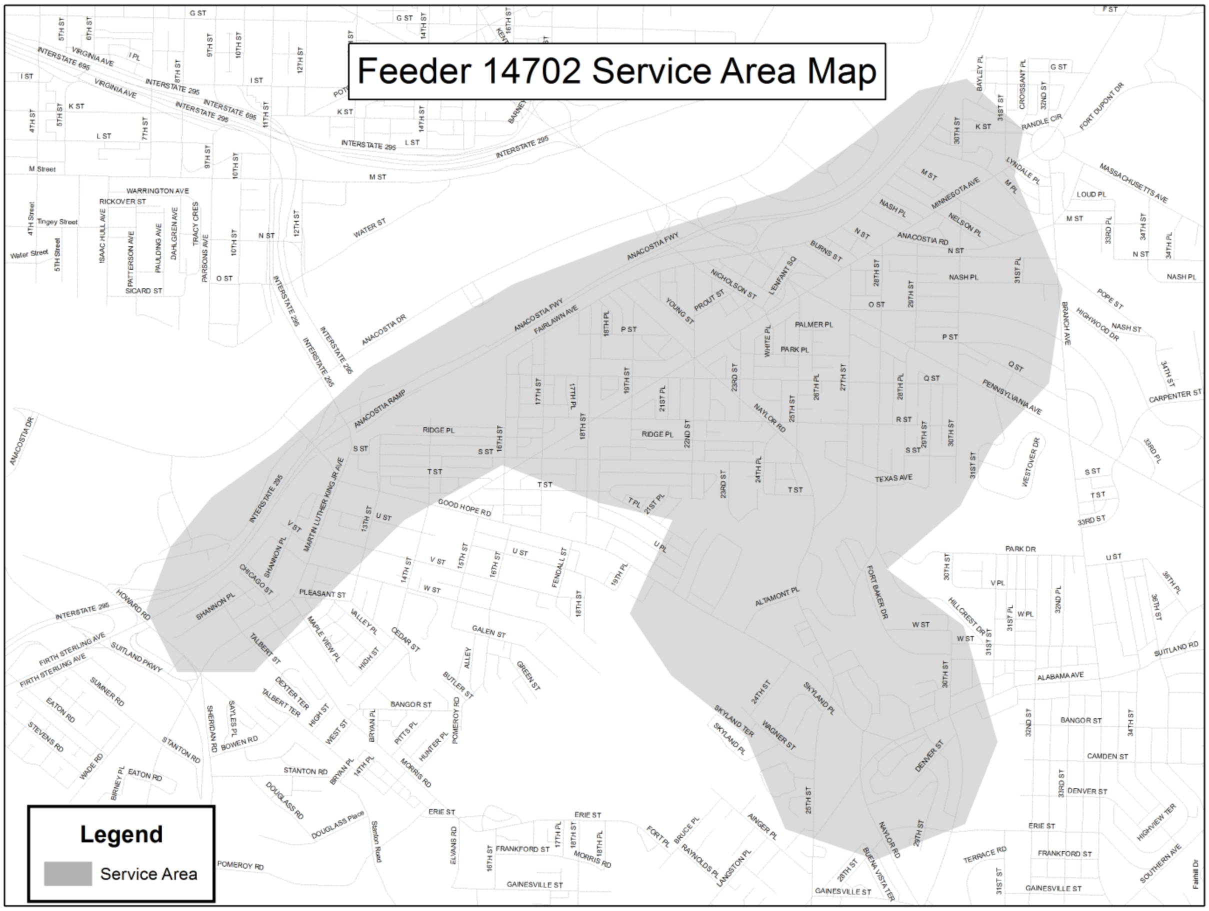
❖ Perform inspection and tree trimming in accordance with the VM Plan

❖ Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Shannon Place SE, Railroad Avenue SE, Railroad Avenue, Good Hope Road SE, Fairlawn Avenue SE, N Street SE, 28th Street SE, O Street SE, 18th Street SE, R Street SE, 22nd Street SE, Minnesota Avenue SE, Naylor Road SE, S Street SE, Altamont Place SE, Anacostia Road SE, Nash Place, Palmer Place SE, Texas Avenue SE, Ridge Place SE, N Street SE, Q Street SE, S Street SE, T Street SE, Q Street SE, 24th Place SE, 25th Street SE, 27th Street SE, 28th Place SE, 29th Street SE, and 30th Street SE.

Total Project Cost Estimate: $780,000

2015 Cash Flow: $780,000



10 - Feeder 15945

This feeder was a 2% Priority Feeder in 2011 and 2013.

Feeder 15945 - Year 2011 - 2015 (IEEE MED Exclusive)

Priority Feeder in 2011

Description of Major Event Exclusive Outages (October 1, 2009 through September 30, 2010):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 28
Total number of customer interruptions during Non-Major Event Days = 7,298

- Mainline events contributed to 29% of the total number of events, which accounted for 99% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:
- 4 - Equipment Failures
- 1 - Unknown
- 3 – Tree

The 4 equipment failures occurred as the result of the following 4 incidents: 3 blown lighting arrestors and 1 failed switch.

- Localized transformer events contributed to 71% of the total number of events, which accounted for less than 1% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:
- 8 - Equipment Failures
- 1 - Unknown
- 1 - Overload
- 5 – Tree
- 5 - Animal

The 8 equipment failures occurred as the result of the following 8 incidents: 2 loose connections, 1 connection burned up, 1 switch failure, 3 failed cutouts, and 1 blown lighting arrestor.

Corrective actions performed in 2011:
Installed/ replaced 300 feet of primary wire, 100 feet of secondary wire, 8 poles, and 6 transformers. Performed tree trimming.

Priority Feeder in 2013

Description of Major Event Exclusive Outages (October 1, 2011 through September 30, 2012):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 23
Total number of customer interruptions during Non-Major Event Days = 3,834

- Mainline events contributed to 13% of the total number of events, which accounted for 96% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:
- 3 - Tree

- Fuse events contributed to 9% of the total number of events, which accounted for less than 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- ➢ 2 - Tree

- Localized transformer events contributed to 78% of the total number of events, which accounted for 4% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:
- ➢ 7 - Equipment Failure
- ➢ 1 - Overload
- ➢ 4 - Tree
- ➢ 2 - Weather
- ➢ 3 - Animal
- ➢ 1 - Other*

The 7 equipment failures occurred as the result of the following 7 incidents: 4 burnt/loose connections, 1 broken fuse, 1 failed transformer, and 1 burnt meter block.

Corrective actions performed in 2013:

Installed/ replaced 23 animal guards, 1 transformer and 1 fuse cutout. Performed tree trimming.

Analysis of Past Corrective Actions

The scope of work of the previous corrective actions did not solve the incidents caused by deteriorating infrastructure. Past corrective actions did not adequately address all of the reliability issues on this feeder.

<u>2015 Priority Feeder – Analysis and Corrective Actions</u>

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 21
Total number of customer interruptions during Non-Major Event Days = 2,560

- Mainline events contributed to 14% of the total number of events, which accounted for 96% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:
- ➢ 3 – Equipment Failures

The 3 equipment failures occurred as a result of the following 3 incidents: 2 failed switches and 1 blown pothead.

- Fuse events contributed to 5% of the total number of events, while accounting for less than 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:
- 1 – Animal

- Localized transformer events contributed to 81% of the total number of events, which accounted for 4% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:
- 4 - Equipment Failures
- 6 – Tree
- 1 - Weather
- 3 – Animal
- 3 – Overload

The 4 equipment failures occurred as the result of the following 4 incidents: 1 broken pole top, 1 defective meter, 1 failed secondary cable, and 1 failed transformer

Corrective Actions Addressed by the Priority Feeder Program:
Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/ replace approximately:
  - 387 feet Primary Tree Wire
  - 601 feet Primary Bare Wire
  - 2,697 feet Secondary Wire
  - 9 Poles
  - 6 Transformers
  - 1 Gang Operated Switch
  - 2 ACRs
  - 112 Cutouts
  - 94 Lightning Arrestors
  - 179 Animal Guards
  - 13 Headguy
  - 7 Downguy

- Perform inspection and tree trimming in accordance with the VM Plan

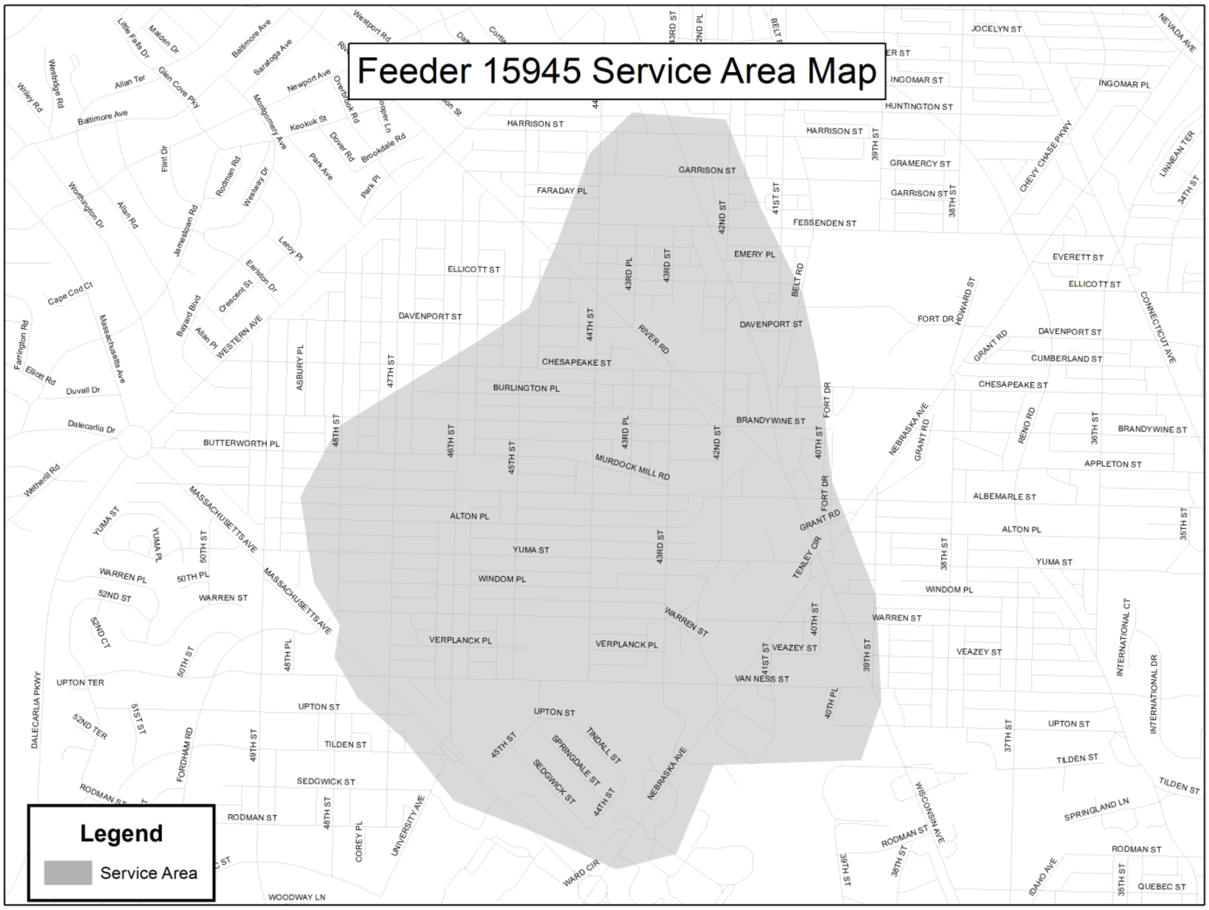
- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Nebraska Avenue NW, Van Ness Street NW, Warren Street NW, 42nd Street NW, River Road NW, 44th Street NW, Brandywine Street NW, 46th Street NW, Wisconsin Avenue, Yuma Street, 45th Street, Albemarle Street NW, Murdock Mill Road, Chesapeake Street

NW, Garrison Street NW, Ellicott Street NW, Davenport Street NW, Burlington Place NW, and Alton Place NW.

Total Project Cost Estimate: $550,000

2015 Cash Flow: $550,000



11 - Feeder 14200

This Feeder was a 2% Priority Feeder in 2009, 2011 and 2013.

Feeder 14200 - Year 2009 - 2015 (IEEE MED Exclusive)

Priority Feeder in 2009

Description of Major Event Exclusive Outages (October 1, 2007 through September 30, 2008):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 10
Total number of customer interruptions during Non-Major Event Days = 7,243

- Mainline events contributed to 50% of the total number of events, which accounted for 98% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 2 – Equipment Failures
- 2 – Unknown
- 1 – Employee

The 2 equipment failures occurred as a result of the following 2 incidents: 1 wire down and 1 cable failure.

- Localized transformer events contributed to 50% of the total number of events, which accounted for 2% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 2 – Equipment Failures
- 1 – Animal
- 2 – Unknown

The 2 equipment failures occurred as a result of the following 1 incident: 2 cable failures.

Corrective actions performed in 2009:

Install/Replace 11 animal guards, 11 lightning arresters, 1 SF6 switch, and tree wire.

Priority Feeder in 2011

Description of Major Event Exclusive Outages (October 1, 2009 through September 30, 2010):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 28
Total number of customer interruptions during Non-Major Event Days = 4,918

- Mainline events contributed to 14% of the total number of events, which accounted for 81% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 3 – Motor Vehicle
- 1 – Equipment Failure

The 1 equipment failure occurred as a result of the following incident: switching of capacitor bank.

- Fuse events contributed to 10% of the total number of events, which accounted for 3% of the total number of customer interruptions.

  - 3 – Equipment Failure

The 3 equipment failures occurred as a result of the following 3 incidents: 2 blown fuses and 1 cable failure.

- Localized transformer events contributed to 75% of the total number of events, which accounted for 16% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 6 – Equipment Failure
- 4 – Animal
- 4 – Motor Vehicle
- 3 - Load
- 3 – Unknown
- 1 – Tree

The 6 equipment failures occurred as the result of the following 6 incidents: 4 cable failures, 1 transformer failure, and 1 blown fuse.

Corrective actions performed in 2011:

Install/Replace approximately 2,358 feet of primary tree wire, 1,449 feet of mainline secondary wire, 210 feet of secondary service wire, 11 poles, 2 cross arms, 6 fuse cutouts, 2 transformers, and 9 animal guards. Performed inspection and tree trimming, in accordance with the Enhanced Integrated Vegetation Management (EVIM) plan; Performed load studies on transformers; Performed thermal vision inspection of overhead facilities.

Priority Feeder in 2013

Description of Major Event Exclusive Outages (October 1, 2011 through September 30, 2012):

Total number of events during Non-Major Event Days (Major Event Exclusive) =30
Total number of customer interruptions during Non-Major Event Days = 4,007

- Mainline events contributed to 10% of the total number of events, which accounted for 85% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Animal
- 1 – Tree
- 1 – Weather

- Fuse events contributed to 17% of the total number of events, which accounted for 10% of the total number of customer interruptions.

In summary, the causes for the fuse events were as follows:

- 2 – Animal
- 2 – Unknown
- 1 – Tree

- Localized transformer events contributed to 98% of the total number of events, which accounted for 22% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 13 - Equipment Failure
- 3 – Animal
- 3 – Other*
- 2 – Weather
- 1 – Unknown

The 13 equipment failures occurred as the result of the following 13 incidents: 5 failed meters, 2 blown fuse, 2 loose connections, 2 cable failures, 1 failed transformer and 1 service cable failure.

Corrective actions performed in 2013:

Install/Replace 166 feet of primary tree wire, 2,642 feet of primary bare wire, 1,109 feet of mainline secondary, 739 feet of secondary service, 16 poles, 19 cross arms, 1 ACR, 1 SF6 switch, 6 manual switches, 6 fuse cutouts, 5 transformers, 18 lightning arrestors, and 41 animal guards.

Analysis of Past Corrective Actions

Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder- Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 23
Total number of customer interruptions during Non-Major Event Days = 2,460

- Mainline events contributed to 13% of the total number of events, which accounted for 95% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 2 – Trees
- 1 – Motor Vehicle Accident

- Fuse events contributed to 4% of the total number of events, while accounting less than 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 – Animal

- Localized transformer events contributed to 83% of the total number of events, which accounted for 5% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 11 – Equipment Failure
- 3 – Weather
- 2 – Animal
- 2 – Unknown
- 1 – Load

The 11 equipment failures occurred as the result of the following 11 incidents: 2 cable failures, 3 service cable failures, 3 blown fuses, 2 failed meters, and 1 transformer failure.

Corrective Actions Addressed by the Feeder Program:
Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 1,725 feet of secondary wire
  - 3 poles
  - 122 animal guards

- Perform inspection and tree trimming in accordance with the VM Plan

- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
4th Street, 8th Street, 9th Street, Evarts Street, Franklin Street, Girard Street, Jackson Street, John McCormack Road, Kearny Street, Lawrence Street, Michigan Avenue and North Capitol Street.

Total Project Cost Estimate: $164,657

2015 Cash Flow: $164,657

Priority Feeder in 2006

Description of Major Event Exclusive Outages (October 1, 2004 through September 30, 2005):

Data is unavailable

Corrective actions performed in 2006:

Install/Replace 114 feet of primary tree wire, 3 cross arms, 1 ACR, 13 lightning arrestors, and 20 animal guards.

Analysis of Past Corrective Actions

The scope of work of the previous corrective actions did not solve the incidents caused by deteriorating infrastructure. Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder- Analysis and Corrective Actions

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 13
Total number of customer interruptions during Non-Major Event Days = 2,311

- Mainline events contributed to 8% of the total number of events, which accounted for 99% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure

The 1 equipment failure occurred as the result of the following incident: 1 cable failure.

- Fuse events contributed to 15% of the total number of events, while accounting for less than 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- ➢ 2 - Animal

- Localized transformer events contributed to 77% of the total number of events, which accounted for 1% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- ➢ 8 - Equipment Failure
- ➢ 1 – Animal
- ➢ 1 – Other*

The 8 equipment failures occurred as the result of the following 8 incidents: 2 loose/open secondary connection, 1 burnt feeder block, 3 defective meters and 2 failed transformers.

Corrective Actions Addressed by the Feeder Program:

Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- ❖ Install/replace approximately:
  - 7,685 feet of secondary wire
  - 1,424 feet of bare wire
  - 53 Transformers
  - 53 poles

- ❖ Perform inspection and tree trimming in accordance with the VM Plan

- ❖ Perform thermal vision of overhead facilities and necessary upgrades

Priority Feeder in 2002

Description of Major Event Exclusive Outages (October 1, 2000 through September 30, 2001):
Data is unavailable.

Corrective actions performed in 2002:
Installed 24 line fuses, corrected wire slack, and performed tree trimming.

Priority Feeder in 2008

Description of Major Event Exclusive Outages (October 1, 2006 through September 30, 2007):
Data is unavailable.

Corrective actions performed in 2008:

Installed 18 animal guards, 20 lightning arresters, 2 cross arms, 2 new fuses, 2 load break switches and repositioned wire on cross arms to clear trees at 3 locations. Transferred 1.8MVA load to an adjacent area feeder. Performed tree trimming.

Analysis of Past Corrective Actions

The scope of work of the previous corrective actions did not solve the incidents caused by deteriorating infrastructure. Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder – Analysis and Corrective Actions:

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 24
Total number of customer interruptions during Non-Major Event Days = 1,812

- Mainline events contributed to 17% of the total number of events, which accounted for 92% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:
- 4 – Equipment Failures

The 4 equipment failures occurred as a result of the following 1 incident: 1 wire down.

- Fuse events contributed to 29% of the total number of events, which accounted for 5% of the total number of customer interruptions.

In summary, the causes for the fuse events were as follows:
- 1 – Equipment Failure
- 5 – Tree
- 1 – Animal

The 1 equipment failure occurred as a result of the following incident: 1 wire down

- Localized transformer events contributed to 54% of the total number of events, which accounted for 3% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:
- 7 - Equipment Failure
- 2 – Tree
- 1 - Weather
- 1 – Overload
- 2 – Other*

The 7 equipment failures occurred as the result of the following 7 incidents: 1 broken fuse, 3 burnt connections, 1 failed transformer, and 2 failed neutrals.

Corrective Actions Addressed by the Priority Feeder Program:

Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/ replace approximately:
  - 1,855 feet of primary Tree Wire
  - 801 feet of PAC
  - 23 Poles
  - 12 Transformers
  - 29 Cutouts
  - 47 Lightning Arrestors
  - 65 Animal Guards
  - 12 Head Guys

- 9 Down Guys

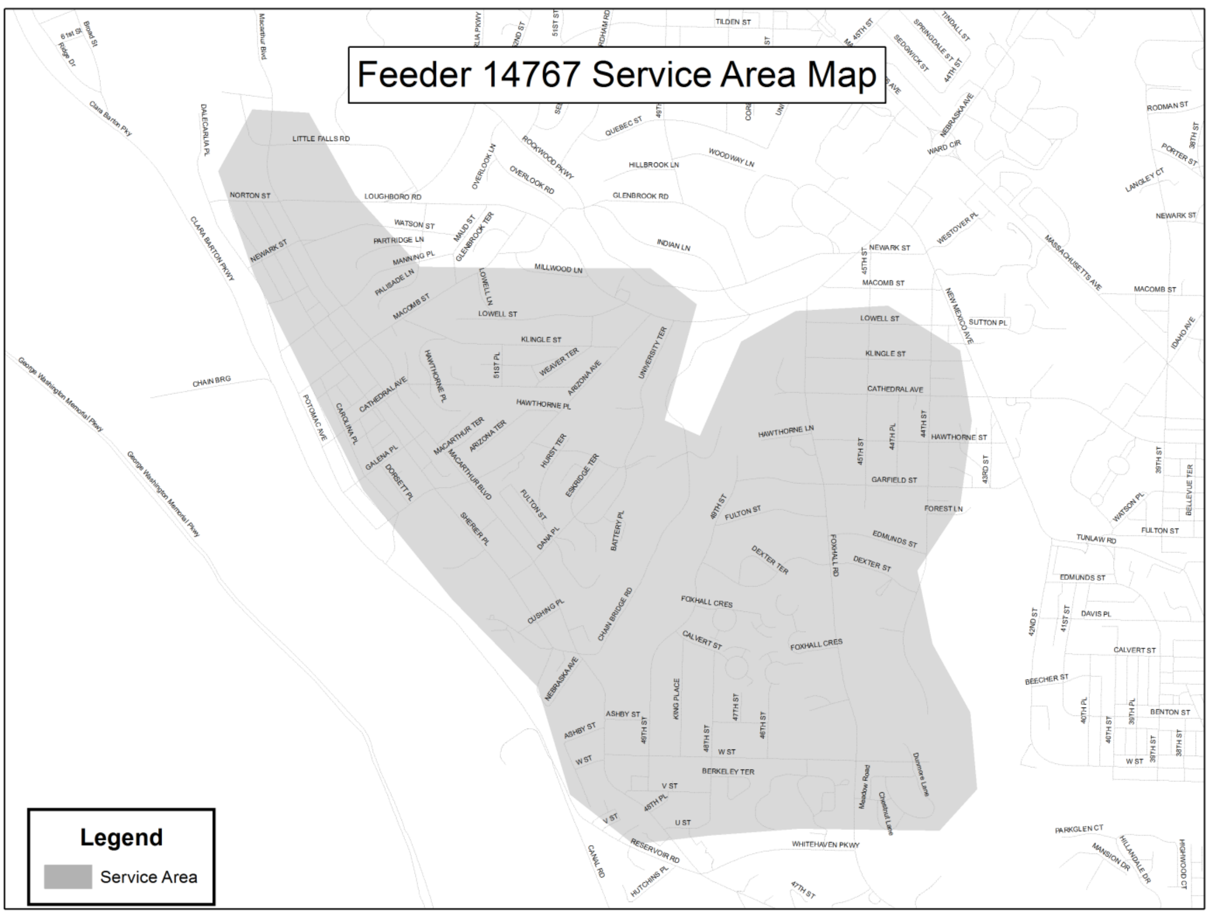
❖ Perform inspection and tree trimming in accordance with the VM Plan

❖ Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
MacArthur Boulevard NW, Ashby Street NW, Ashby Street NW, W Street NW, Foxhall Road NW, Galena Place, Arizona Avenue NW, Dana Place NW, V Street NW, 49th Street NW, 46th Street NW, Edmunds Street NW, Garfield Street NW, Hawthorne Lane NW and Cathedral Avenue NW.

Total Project Cost Estimate: $651,000

2015 Cash Flow: $651,000



15 - Feeder 00082

This feeder was a 2% Priority Feeder in 2007.

Feeder 82 - Year 2007 - 2015 (IEEE MED Exclusive)

Priority Feeder in 2007

Description of Major Event Exclusive Outages (October 1, 2005 through September 30, 2006):

Data is unavailable.

Corrective actions performed in 2007:

Installed 6 animal guards, replaced 3 cross arms, and performed tree trimming.

Analysis of Past Corrective Actions

The scope of work of the previous corrective actions did not solve the incidents caused by deteriorating infrastructure. Past corrective actions did not adequately address all of the reliability issues on this feeder.

2015 Priority Feeder – Analysis and Corrective Actions:

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 8
Total number of customer interruptions during Non-Major Event Days = 1,112

- Mainline events contributed to 38% of the total number of events, which accounted for 92% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 2 – Equipment Failure
- 1 - Unknown

The 2 equipment failures occurred as a result of the following 1 incident: 1 underground cable failure.

- Localized transformer events contributed to 62% of the total number of events, which accounted for 8% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 2 - Equipment Failure
- 1 – Overload
- 2 – Other*

The 2 equipment failures occurred as the result of the following 2 incidents: 1 damaged meter and 1 loose connection.

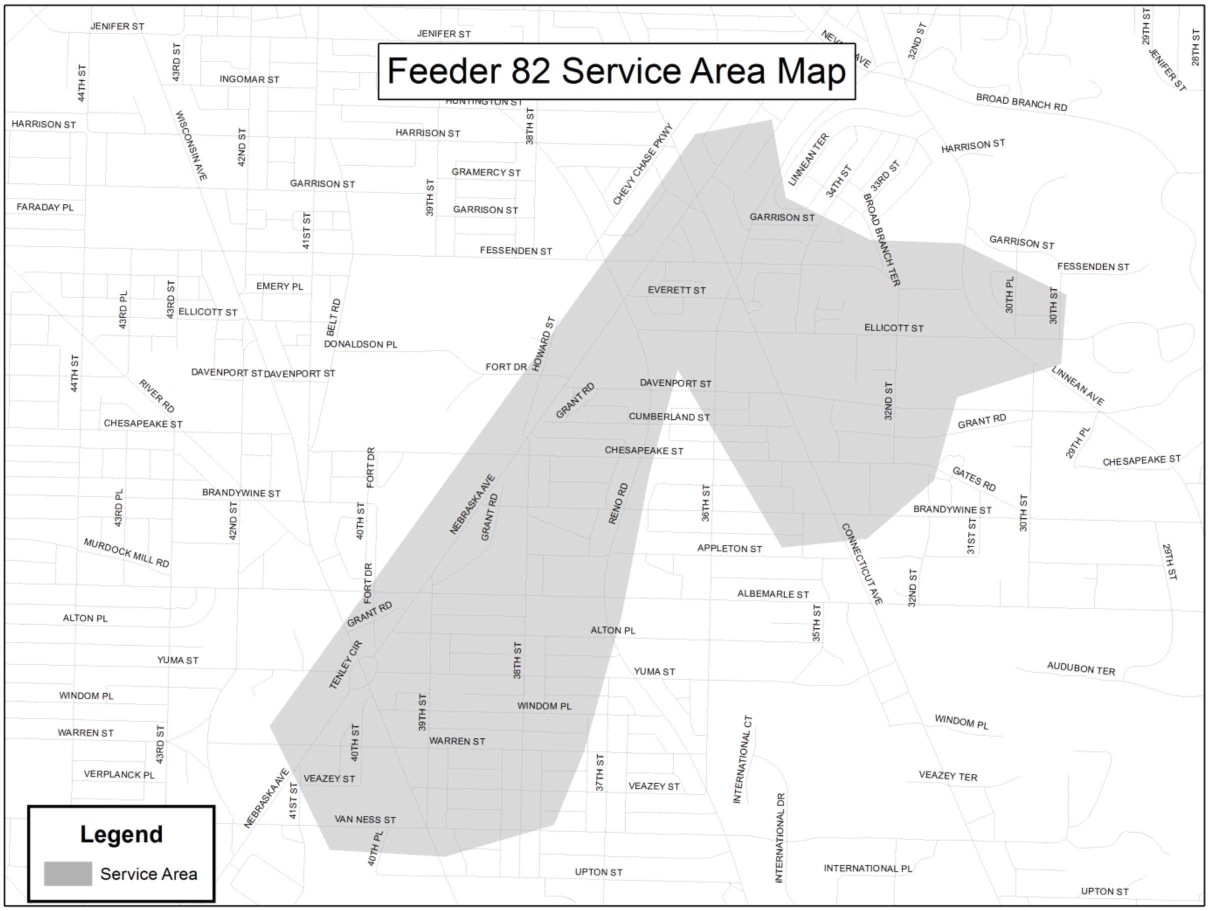
Corrective Actions Addressed by the Priority Feeder Program:
Review of the outage history, feeder map, and past corrective actions identified the following option for consideration:

- Install/ replace approximately:
    - 920ft of Secondary Triplex wires
    - 2000ft Secondary Service Triplex wires
    - 44 Poles
    - 12 Transformers
    - 3 Cutouts
    - 42 Animal Guards
    - 3 Lightning Arrestors
    - 7 Down Guys
- Perform inspection and tree trimming in accordance with the VM Plan
- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Windom Place NW, 38th Street NW, Cumberland Street NW, Nebraska Avenue NW, Davenport Street NW, 32nd Street NW, Ellicott Street NW, Yuma Street NW, Alton Place NW, Brandywine Street NW, Grant Road NW, 39 Street NW and Fessenden Street NW.

Total Project Cost Estimate: $481,000

2015 Cash Flow: $481,000



16 - Feeder 00133

This feeder was not a 2% Priority Feeder previously.

<u>2015 Priority Feeder- Analysis and Corrective Actions</u>

Description of Major Event Exclusive Outages (October 1, 2013 through September 30, 2014)

Total number of events during Non-Major Event Days (Major Event Exclusive) = 14
Total number of customer interruptions during Non-Major Event Days = 1,009

- Mainline events contributed to 22% of the total number of events, which accounted for 94% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure
- 2 – Trees

The 1 equipment failure occurred as the result of the following incident: 1 cable failure.

- Fuse events contributed to 7% of the total number of events, while accounting for less than 1% of the total number of customer interruptions.

In summary, the cause for the fuse event was due to:

- 1 – Other*

- Localized transformer events contributed to 71% of the total number of events, which accounted for 5% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 3 - Equipment Failure
- 4 – Tree
- 1 – Unknown
- 1 – Animal
- 1 – Load

The 3 equipment failures occurred as the result of the following 3 incidents: 1 loose secondary connection, 1 failed transformer and 1 cable failure.

Corrective Actions Addressed by the Priority Feeder Program:

Review of the outage history, feeder map and past corrective actions identified the following option for consideration:

- Install/replace approximately:
  - 10,008 feet of secondary wire
  - 5,487 feet of tree wire
  - 54 poles
  - 24 transformers
  - 1 capacitor
  - 1 gang switch

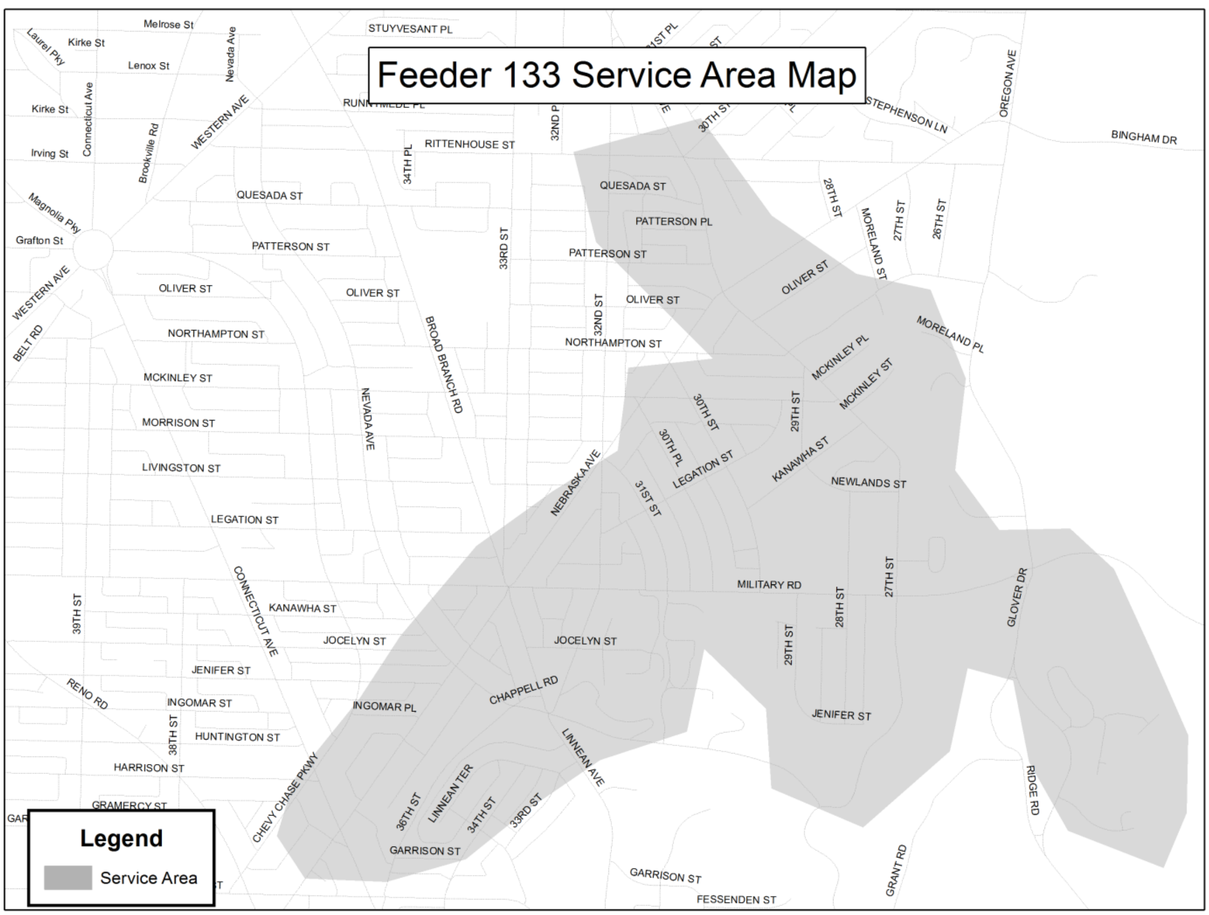
- ❖ Perform inspection and tree trimming in accordance with the VM Plan

- ❖ Perform thermal vision of overhead facilities and necessary upgrades.

The work locations include:
Jocelyn Street NW, 36th Street NW, 32nd Street NW, Legation Street NW, 30th Street NW, 30th Place NW,29th Street NW, 28th Street NW, Jenifer Street NW, 27th Street NW, Kanawha Street NW, McKinley Street NW, McKinley Place NW, Military Road, Nevada Avenue, Patterson Place NW, Quesada Street NW and Utah Avenue NW.

Total Project Cost Estimate: $756,656

2015 Cash Flow: $756,656



2014 CPI-Selected Feeders

In addition to Pepco's new method of ranking the performance of distribution feeders, Pepco is also using CPI to rank the performance of its distribution feeders. As discussed in the Feeder Improvement discussion of Section 1.3.6, the CPI was Pepco's prior method of identifying Priority Feeders. Feeders that would have been selected as Priority Feeders using the CPI method are included in the Company's Feeder Improvement category of its REP program for remediation. These CPI-selected feeders for inclusion in the Feeder Improvement REP program are identified below along with corrective action plans.

2015 Priority Feeders For Improvement (Data is based on October 1, 2013 through September 30, 2014)								
Feeder No.	Substation	Area / District	Customers Served	Number of Outages	Reliability Indices

Average of 16 Selected Feeders in DC			697	14	2.57	305	119	n/a

Of the 16 feeders included in the CPI ranking for 2014, only Feeder No. 86, was not also ranked using the new SPC method.

<u>Feeder 177</u>

This was not previously a 2% Priority Feeder.

<u>2014 Priority Feeder – Analysis and Corrective Actions</u>

Description of Major Event Exclusive Outages (October 1, 2012 through September 30, 2013):

Total number of events during Non-Major Event Days (Major Event Exclusive) = 10
Total number of customer interruptions during Non-Major Event Days = 765

- Mainline events contributed to 20% of the total number of events, which accounted for 85% of the total number of customer interruptions.

In summary, the causes for the mainline events were as follows:

- 1 – Equipment Failure
- 1 – Lightning

This 1 equipment failure occurred as the result of 1 incident; a primary cable fault.

- Localized transformer events contributed to 85% of the total number of events, which accounted for 15% of the total number of customer interruptions.

In summary, the causes for the transformer events were as follows:

- 1 – Customer's service disconnected
- 4 – Equipment Failure
- 3 – Tree

These 4 equipment failures occurred as the result of the following 4 incidents; 1 defective cutout, 1 leaning pole, and 2 loose connections.

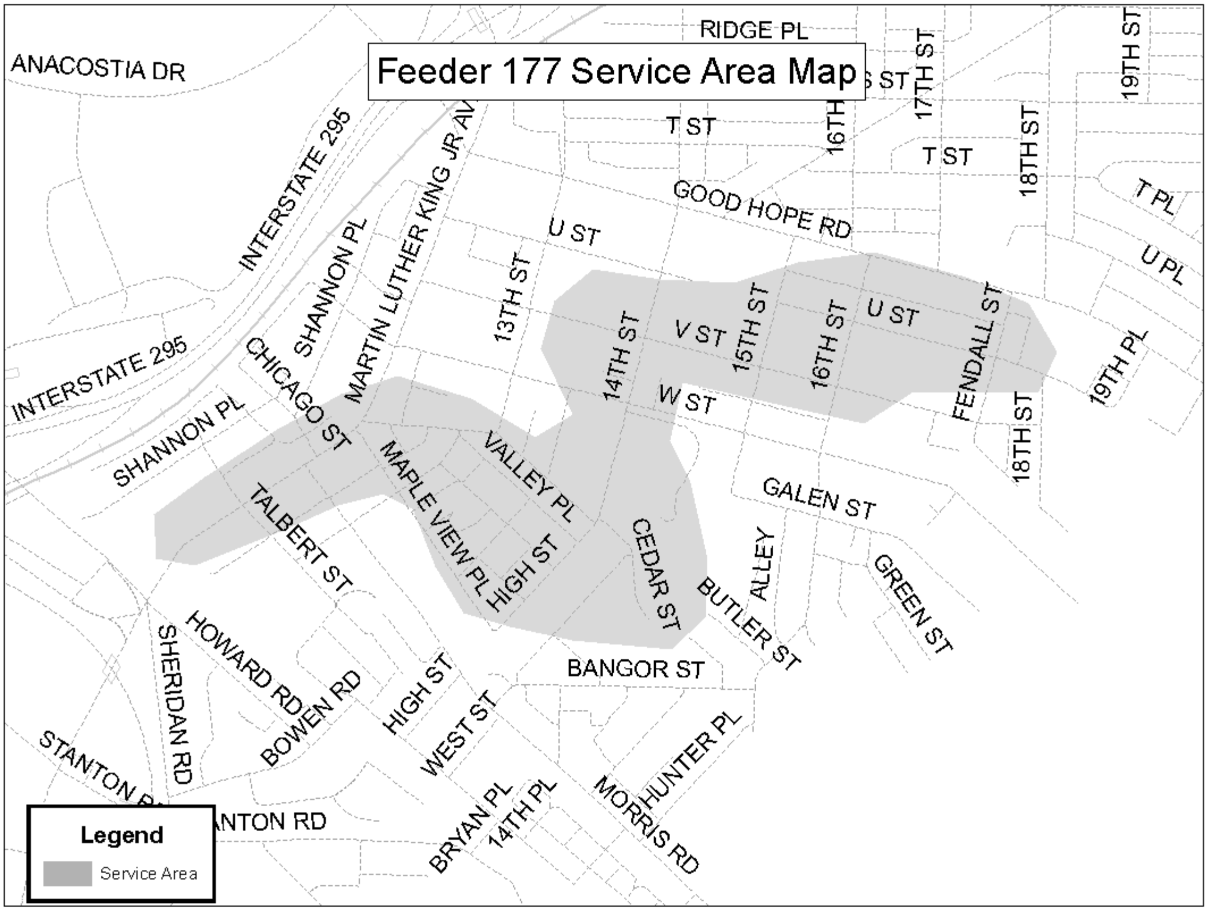
Corrective Actions Addressed by the Priority Feeder Program:

Review of the outage history, feeder map, and past corrective actions identified the following options for consideration:

- Install/replace approximately:
  - 5,320 feet of secondary wire;
  - 7 poles;
  - 3 transformers;
  - 1 gang switch
- Perform inspection and tree trimming in accordance with the VM Plan
- Perform thermal vision of overhead facilities and necessary upgrades

The work locations include:
Chester Street SE, High Street SE, Alley (between High Street and Mount View Place), Alley (off Chester Street), and V Street (between 15th and 16th Streets)

Total Project Cost Estimate: $138,555



2.4.1.3 Review of 2013 Priority Feeder Program (Least Reliable Feeders)

Activities conducted to improve the performance of each of the feeders in the 2013 Priority Feeder Program are identified in Table 2.4-B.

2013 2% Priority Feeder Program - District of Columbia - Completed/ Pending Completion Corrective Actions

Table 2.4-C

2.4.1.4 AGGRESSIVE CORRECTIVE ACTION PROGRAM

Annual Program for Repeat Priority Feeders[46]

The review of the 16 feeders selected for the 2% Priority Feeder initiative with previous year selections show that four feeders 14006, 14200, 15174, and 15945, which were in the 2013 Priority feeder Program reappear on the 2015 Priority Feeder Program. When a feeder repeats, additional aggressive corrective actions are implemented. All of the corrective actions listed in Section 2.4.1.2 will be completed in 2015.

Corrective action plans are based on an analysis of outage causes on a feeder. Tables 2.4-D1 through 2.4-D4 provide a comparison of the outage cause contributions for the 2015 Priority Feeders that were also identified as a Priority Feeder in 2013: feeders 14006, 14200, 15174, and 15945. The 2013 and 2015 Outage Cause Contributions are based on a rolling 12 month history performance, exclusive of Major Event Days, from October 1, 2011 to September 30, 2012 and October 1, 2013 to September 30, 2014, respectively.

Table 2.4-D4

2.4.2 RELIABILITY STATISTICS

Service Reliability Indices

SAIDI, SAIFI, and CAIDI are the specific indices used and provide information about both the duration and frequency of outages for customers. These indices are described as follows:

- **SAIDI -** System Average Interruption Duration Index. Designed to provide information about the average time (in aggregate) that the customers served in a predefined area are interrupted.
- **SAIFI -** System Average Interruption Frequency Index. Designed to give information about the average frequency of sustained interruptions per customer served in a predefined area.
- **CAIDI** - Customer Average Interruption Duration Index. Designed to provide information about the average time required to restore service to the average customer experiencing a sustained interruption.

Each index is calculated several times; once with all outage data and then according to the specific significant event exclusions specified. The expectation is that the indices calculated with significant event related outage data excluded will provide a reflection of system performance under normal operating conditions. The indices calculated with all outage data will provide a reflection of the impact of significant events on the system. It is important to note that a year-to-year comparison of reliability indices calculated with all outage data would not be appropriate. The indices during a year in which major storms impact an electric utility will be substantially different from the indices during a year with no major storms.

Service Outage Statistics[47,48]

---

[47] In Order No. 16623 paragraphs 48, 62 and 63, the Commission stated the following:

48. *…Therefore, we hereby require that Pepco include reliability calculations using District of Columbia-only data and relying on a Major Service Outage exclusion in the 2012 Consolidated Report and in future Consolidated Reports. We also require that Pepco include in its 2012 Consolidated Report a revised version of its reliability calculations from the 2010 and 2011 Consolidated Reports using D.C.-only data and excluding Major Service Outages.* [See Table 2.4-F2] *Pepco shall also include calculations of reliability indices for the entire Pepco system using system-wide data and Major Event Day exclusions,* [See Table 2.4-E] *as well as reliability indices for Pepco D.C. using D.C.-only MEDs in the 2012 Consolidated Report and in future Consolidated Reports, so that we may make comparisons.* [See Table 2.4-F3] *For purposes of this requirement, the "reliability calculations" contained in the Consolidated Report include all calculations of SAIDI, SAIFI and CAIDI,* [See Tables 2.4-E through 2.4-F3] *discussion of failure rate data,* [Failure rate data analysis is based on all events, per PIWG decision in the October 18, 2011 PIWG meeting.] *and selection of Priority Feeders.* [The Priority Feeders were selected in October 2011 using prior methodology.] *(Footnote: Because the Aggressive Corrective Action Program requires the identification of feeders that have been listed as Priority Feeders in the past using system-wide, MED-excluding data, we will allow Pepco to continue to select ACAP feeders using that data. However, we require that a list of Priority Feeders using the new method of calculation be included in the 2012 Consolidated Report.)*
62. *Pepco is DIRECTED to include in the 2012 Consolidated Report reliability calculations using District of Columbia-only data and excluding Major Service Outages consistent with paragraph 48;* [See Table 2.4-F2.]
63. *Pepco is DIRECTED to include in the 2012 Consolidated Report a revised version of the reliability calculations contained in the 2010 and 2011 Consolidated Report using District of Columbia-only data and excluding Major Service Outages consistent with paragraph 48.*

[48] In Order No. 16700 issued February 12, 2012, paragraphs 10 and 11, the Commission stated:

10. *In establishing out new reliability performance standards, we decided that Pepco should be given a reasonable amount of time to "ramp up" to our new requirements. Therefore, we made the new SAIDI and SAIFI standards effective beginning in 2013. By replacing the prior rule with a new one, and giving Pepco a transition period, we created a "gap" in reliability measures. We saw no harm in a temporary suspension of reliability benchmarks, recognizing that the standards in effect for 2013 through 2020 would require significant improvement on Pepco's part, starting at once. For example, in order to meet our 2013 SAIDI target, Pepco must make either about a 9% improvement in both 2012 and 2013 or about an 18% improvement in 2013. Therefore, we saw no risk that Pepco would suffer a significant "backslide" in reliability because there were no effective standards in place for 2011 or 2012.*
11. *We do not believe that reestablishment (for the years 2011 and 2012) of the standards to which Pepco was previously held is necessary. (Footnote: We note that not all states have Electric Quality of Service Standards. For example, Pepco presently operates in Maryland without standards but is required to provide annual reliability indices pursuant to COMAR 20.50.07.06.) Nor has Pepco provided any reason for that reestablishment. Consequently, we decline to make the clarification that Pepco requests. However, we do expect that Pepco will continue to report on its reliability performance in its annual Consolidated Report and we concur with OPC in its suggestion that Pepco coordinate its data reporting so that Pepco calculations are a consistent "apples to apples" comparison from 2011 through 2013 and beyond. Therefore, as OPC has requested, we require Pepco to include in its annual report a description of its performance and a calculation of whether it would have met the appropriate SAIFI, SAIDI and CAIDI standards had they been in effect.*
14. *Pepco shall include in its 2012 and 2013 annual Consolidated Reports calculations of SAIDI, SAIFI, and CAIDI as described in paragraph 11.*

Presented in Table 2.4-E are the SAIDI, SAIFI and CAIDI values for the past five years. These reliability indices are provided for all sustained interruptions and all sustained interruptions excluding major events. A sustained interruption is defined as an interruption of five (5) minutes or greater.

Excluding all cross-border feeders	**0.57**	**1.44**
Including all cross-border feeders*	**0.75**	**1.67**
* Note - COMAR is a Maryland criteria and MSO is a DC criteria.		
MSO and COMAR are not compatible with each other.		
** No IEEE MEDs, MSO, or COMAR exclusions in 2013		

Table 2.4-F4

Comparison of Cross-Border Feeder Reliability Performance[49]

Pepco calculates reliability indices on a feeder level in the same way regardless of the location of a feeder. For feeders that have customers in both the District of Columbia and Maryland, the indices for these feeders are included for reporting purposes with the jurisdiction in which the majority of customers on these feeders reside. Because feeders may switch between jurisdictions over time, to make their impact on reliability performance clear, Pepco presents system reliability performance both with and without

[49] The following is in response to the Commission's directive to:

> [I]nclude in its 2015 Annual Consolidated Report an explanation of the metric or metrics it will use to report upon the reliability performance of its cross-jurisdictional feeders. This explanation is also to describe how Pepco's chosen metric(s) will allow reliability performance to be compared from year-to-year, when the jurisdictional status of a feeder changes between Maryland and the District .

In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 241 (February 27, 2015).

both feeders assigned to the District of Columbia and Maryland, thereby allowing comparisons across different years.

In 2014, there were 29 feeders counted as District of Columbia feeders that also include Maryland customers (That is, the majority of customers on the feeder reside in the District of Columbia). These feeders are counted as part of the District of Columbia's reliability indices (IEEE Major Event Days excluded) in 2014 where SAIFI is 0.64 and SAIDI is 1.36 hours. If the 29 feeders were excluded from the 2014 District of Columbia reliability indices, then these indices will change. The SAIFI would decrease by 13.7% (0.55) and the SAIFI would decrease by 3.47% (1.31 hours).

Conversely, there are several customers in that reside in the District of Columbia that are served by feeders in which the majority of the customers on these feeders are located in Maryland. These feeders, 34 in total, are treated as Maryland feeders. They are currently used in the calculation of Pepco-Maryland's reliability indices and not counted towards those for the District of Columbia. If those 34 feeders were counted as District of Columbia feeders, the SAIFI for DC would increase by 8.7% (0.70) while the SAIDI would increase by 1.54% (1.38 hours) when excluding IEEE Major Event Days.

The Major Storm Outages (MSO) criteria used in the District of Columbia differs in its selection of excludable events from the Maryland storm criteria (COMAR or MED). Therefore the two criteria are not compatible with each other, making comparisons difficult. However, if all of the cross jurisdiction feeders were excluded then the SAIFI and SAIDI (MSO excluded) would decrease by 16.43% (0.57) and 10.5% (1.44 hours), respectively. If the cross jurisdiction feeders including the ones with predominately Maryland customers are incorporated into the District of Columbia's reliability indices, the SAIFI will increase by 9.32% (0.75) and the SAIDI by 4.1% (1.67 hours) when excluding MSO and MEDs.

Table 2.4-F6

2.4.3 NEIGHBORHOOD ANALYSIS

Starting with Order No. 16623, the Commission has required a specific focus on neighborhoods in the Consolidated Report. This section addresses each of the neighborhood subjects required by the Commission.

In response to the Commission's requirements for reporting the neighborhoods impacted by reliability issues and remediation work, Pepco developed a comprehensive list of the feeders serving District of Columbia customers and the neighborhoods served by each in May of 2012. In order to provide neighborhood identification that is both accurate and consistent from one submission to another, Pepco is now using assessment neighborhoods as defined by the District of Columbia Office of Tax and Revenue (OTR) Real Property Tax Administration (RPTA). This data is maintained by the District of Columbia and is available as a GIS file[50] allowing Pepco to programmatically identify the neighborhoods each Pepco feeder serves. These assessment neighborhoods are named somewhat differently from the neighborhood map posted in Wikipedia that was used to define neighborhoods for previous submissions, but that map was not maintained by the District of Columbia and was not available in GIS format. Pepco's previous approach to identifying neighborhoods required Pepco personnel to determine neighborhoods served by a feeder manually. Where neighborhoods reported in this 2015 Consolidated Report are inconsistent with previously identified neighborhoods associated with a given feeder, the differences are due to the Company's new automated approach to identifying neighborhoods served.

[50] The Company used the Assessment Neighborhoods shapefile "DCGIS.AsNbhdPly" located at http://data.dc.gov/Metadata.aspx?id=127 on May 15, 2012 to complete the GIS-based analysis associating each feeder with the assessment neighborhoods it serves.

Neighborhood Analysis Requirements

(A) Neighborhoods warranting infrastructure improvements due to increased load growth[51]

Response: See discussion for Neighborhood Item A below.

(B) Neighborhoods with decreased planned spending on 4 kV to 13 kV conversions[52]

(C) Neighborhoods with decreased planned spending on 4 kV to 13 kV conversions that are among previously identified Most Susceptible Neighborhoods[53]

(D) Explanation of how reduced conversion spending will improve reliability in Most Susceptible Neighborhoods[54]

Response: See discussion for Neighborhood Items B, C, and D below.

(E) Neighborhoods served by Priority Feeders[55]

Response: See Priority Feeder discussion.

---

51 Order No. 16623 states the following at paragraph 35:

35. We find Pepco's explanation to be credible, but require further information on the neighborhoods in the District impacted by Pepco's changed plans. Specifically, we direct Pepco to identify those neighborhoods which warrant further infrastructure improvements due to increased load growth, including any explanation and data on Pepco's forecasts of load growth in those neighborhoods. (<u>Footnote:</u> In identifying neighborhoods, Pepco should use the methodology it used for defining and selecting neighborhoods in its May 20, 2011 submission to the Commission, or provide an explanation of why that methodology was not used. See F.C. Nos. 766, 982 and 991, Response of the Potomac Electric Power Company to Order No. 16347, May 20, 2011, Attachment 2.)…

52 Order No. 16623 states the following at paragraph 35:

…Similarly, we require Pepco to identify those neighborhoods where planned spending on 4 kV to 13 kV conversion projects has decreased…

53 Order No. 16623 states the following at paragraph 35:

…Further, we require that Pepco indicate if any of the neighborhoods it identifies pursuant to this paragraph is among the Most Susceptible Neighborhoods identified in Order No. 14626, Appendix A. (<u>Footnote:</u> See F.C. Nos. 766, 982, and 991, Order No. 16426, July 7, 2011, Appendix A.)…

54 Order No. 16623 states the following at paragraph 35:

If any of the neighborhoods identified in this paragraph is among those Most Susceptible Neighborhoods, Pepco is directed to provide a full explanation of how its changed plans will improve reliability in that neighborhood.

55 Order No. 16623 states the following at paragraph 46:

46. In connection with the second prong of our reliability efforts, our neighborhood initiative, we believe it is important to know whether any of the Priority Feeders are the feeders which serve the Most Susceptible Neighborhoods in the District. Beginning in the 2012 Consolidated Report, we require that Pepco identify the neighborhoods served by any Priority Feeders…

(F) Neighborhoods served by Repeat Priority Feeders[56]

Response: See Repeat Priority Feeder discussion.

(G) Neighborhoods served by equipment subject to failure data rate analysis[57]

Response: See Failure Data Rate Analysis discussion.

(H) Updated list of Most Susceptible Neighborhoods for Calendar Year 2011[58]

Response: See Neighborhood Item H, Most Susceptible Neighborhoods update below.

(I) Neighborhood information to be included in 2012 Consolidated Report[59]

Response: This information was included in the 2012 Consolidated Report as specified above.

(J) Directive to identify neighborhoods affected by changed plans[60]

Response: See discussion for Neighborhood Items A, B, C, and D below.

(K) Directive to provide information on neighborhoods[61]

Response: See discussion for Neighborhood Items E, F, G, H, and I.

---

[56] Order No. 16623 states the following at paragraph 46:

> *…and any Repeat Priority Feeder (those in the ACAP program). (Footnote: In identifying neighborhoods, Pepco should use the methodology it used for defining and selecting neighborhoods in its May 20, 2011 submission to the Commission, or provide an explanation of why that methodology was not used. See F.C. Nos. 766, 982 and 991, Response of the Potomac Electric Power Company to Order No. 16347, May 20, 2011, Attachment 2.)...*

[57] Order No. 16623 states the following at paragraph 46:

> *…Further, we require that Pepco identify the neighborhoods served by any equipment subject to the failure data rate analysis proposed by Pepco at the October 18, 2011 PIWG meeting for inclusion in the 2012 Consolidated Report. (Footnote: See October 18, 2011 PIWG Meeting Minutes at 1.)…*

[58] Order No. 16623 states the following at paragraph 46:

> *We also require Pepco to update its list of Most Susceptible Neighborhoods to identify the neighborhood in each Ward experiencing the most frequent non-major outages in Calendar Year 2011.*

[59] Order No. 16623 states the following at paragraph 46:

> *…This information should be included in the 2012 Consolidated Report.*

[60] Order No. 16623 states the following at paragraph 55:

> *55. Pepco is DIRECTED to identify neighborhoods affected by changed plans consistent with paragraph 35;*

[61] Order No. 16623 states the following at paragraph 60:

> *60. Pepco is DIRECTED to provide information on neighborhoods consistent with paragraph 46;*

Neighborhood Item A.

Neighborhoods with Increased Load Growth

Pepco forecasts load by substation using identified PNB load to develop short term forecasts and uses trends plus knowledge of future planned development to develop a long term forecast for each substation in the Pepco system.

There are areas where Pepco anticipates above average load growth and these include the Mt. Vernon Square/Convention Center neighborhood (R.L.A.[62] (N.E.) assessment neighborhood), NoMa (R.L.A. (N.E.) assessment neighborhood), the Washington Navy Yard/Southwest (R.L.A. (S.W.) assessment neighborhood) neighborhood and the area around St. Elizabeth's Hospital.

Mt. Vernon Square/Convention Center and NoMa

Pepco added one new transformer to the existing Florida Avenue substation in 2014 and is planning to add capacity to the existing Northeast substation by adding a new substation transformer in 2016. These measures will address load growth in the Mt. Vernon Square/Convention Center (Old City 2 assessment neighborhood) and NoMa neighborhoods. Pepco is planning to build a new substation near the area of Mt. Vernon Square in 2020 to address load growth in the NoMa (R.L.A. (N.E.) assessment neighborhood) and the Mt. Vernon Triangle (Old City 2 assessment neighborhood) areas.

Washington Navy Yard/Southwest

Pepco is planning the proposed Waterfront substation to be built in 2017 in the Buzzard Point (Old City 1 assessment neighborhood) area to address load growth in the Washington Navy Yard and Southwest (R.L.A. (S.W.) assessment neighborhood) neighborhoods.

---

[62] Redevelopment Land Agency.

St. Elizabeth's Hospital

Pepco is planning to add shunt reactors at its Alabama Avenue substation in 2015 that will increase existing substation capacity to serve load in the St. Elizabeth's Hospital area.

Columbia Heights

Pepco has installed a fourth transformer at Florida Avenue Sub. 10 in 2014 to increase capacity at that substation. Pepco is also planning to rebuild the Harvard 13 kV substation in 2021, increasing its capacity from 46.5 MVA to ultimately 210 MVA.

Neighborhood Items B, C, D.

Neighborhoods with Decreased Planned Spending on 4 kV to 13 kV Conversions

The neighborhoods served by Anacostia Sub. 8 (Anacostia and Randle Heights) will see less planned spending on conversions in 2015 because most of the next phase of conversion work has been moved to the DC PLUG initiative. This is because much of the 4 kV load in the next phase is to be converted to Feeder 15177 which has been identified as a feeder to be undergrounded in year two of the DC PLUG initiative. The 4 kV conversion work will be done in conjunction with the undergrounding of Feeder 15177, scheduled to be completed in the 2016-2017 timeframe. Randle Heights is identified as one of the most susceptible neighborhoods in 2014, but Anacostia has not been previously identified as a Most Susceptible Neighborhood.

The neighborhoods served by the Harrison 4 kV substation (Friendship Heights and Chevy Chase) will see less money spent on 4 kV conversions in 2015 because that project should be completed in the first half of the year. The neighborhoods served by the Anacostia 4 kV substation (Anacostia, Barry Farm, and Buena Vista) will see reduced spend on 4 kV conversions in 2015, but will benefit later as several of the 4 kV lines will be converted to a new underground feeder as part of the DC PLUG initiative. The neighborhoods served by the North Capitol 4 kV substation (Manor Park, Fort Totten, and Petworth) will see somewhat less spending on 4 kV conversions in 2015 as the next phase of conversions begins and resources are marshalled for that area.

Neighborhood Item F. [63]

Table 2.4-G lists the feeders that have appeared more than once on the 2% Priority Feeder list, the years they appeared, and the neighborhoods they serve.

[63] In Order No. 15941 issued on August 18, 2010, the Commission stated at paragraphs 13 and 16, the following:

13. *Beginning with the 2011 Consolidated Report, Pepco shall identify any feeders that have appeared more than once on the Priority Feeder List, by year from the first Priority Feeder List in 2002, so that it shall be apparent how many times each feeder has appeared on the Priority Feeder List…*
16. *Pepco IS DIRECTED to identify in its 2011 and successive Consolidated Reports, each feeder that has appeared more than once on the Priority Feeder List.*

	Feeder	Years Appeared on Priority Feeder List Since 2002	Neighborhoods
1	27	2007, 2009	Brookland, Columbia Heights, Ledroit Park

Table 2.4-G

<u>Neighborhood Item H.</u>

Most Susceptible Neighborhoods By Ward With Most Frequent Non-Major Outages In 2014

Most Susceptible Neighborhood Analysis

Pepco was directed to provide analysis regarding the neighborhoods in each District Ward which were most susceptible to outages as determined by outage data. In defining neighborhoods, as well as the capability of providing reliability measures at the neighborhood level, Pepco took the approach of determining the poorest performing feeder in each ward and identifying the neighborhood(s) served by that feeder. The feeder performance evaluation period is from October 1, 2013, to September 30, 2014, and is exclusive of major service outages.

The first analysis consists of determining the feeder in each ward that had the highest number of total customer interruptions (CI) during the evaluation period. As such, the selected feeders would represent the highest contributors to system SAIFI in their respective wards. Pepco refers to this characteristic of feeder performance as "contribution to SAIFI", denoting the impact a single feeder has on the overall performance of a given group of feeders—in this case, the District of Columbia electric distribution system. See Table 2.4-H1 below for the analysis by SAIFI contribution.

In addition, Pepco was directed to provide analysis using customer minutes of interruption (CMI) to identify the poorest performing feeder in each ward and identifying the neighborhood(s) served by that feeder. Pepco refers to this selection criteria as "contribution to SAIDI". As additionally ordered by the Commission for this analysis, Pepco has included scheduled or planned outages when computing CMI. However, it should be noted that planned outages on a feeder are generally taken in order to improve the reliability of the feeder. Such outages are typically planned for employee safety reasons or when no practical energized alternative exists. Pepco therefore cautions that the inclusion of planned outages in such analyses could have the effect of causing a feeder to be selected in subsequent analysis simply due to its efforts to remediate the initial condition. See Table 2.4-H2 below for the analysis by SAIDI contribution.

Table 2.4-H2

From the analyses above, contribution to SAIFI and contribution to SAIDI (including planned outages) combined yielded 12 unique feeders. Of the 12 feeders, 11 have had recent reliability work done or have been scheduled for corrective action as part of the 2015 REP. See summary below: [64]

- Feeders 76, 211 and 15945 are part of the 2015 Priority Feeder program;
- Feeder 15204R was part of the 2014 REP Feeder Improvement program;
- Feeders 14136, 15021, 15130, 15166, 15199 and 14717 were part of the 2014 Priority Feeder program;
- Feeder 14014 was part of the 2013 Priority Feeder program with corrective actions completed by the 4th quarter of 2014; and
- Feeder 15764 was not part of any program. However, its current reliability performance does not indicate the need for corrective actions. Pepco will continue to monitor its performance.

[64] Feeder Nos. 14136, 14014, 15130, and 15166 have all been selected to be placed underground as part of the DC PLUG initiative.

2.4.4 EQUIPMENT FAILURE RATES[65]

Pepco continues improvements to the quality of outage data. Outage data records are screened at multiple check points for accuracy. Control Center personnel review outage data daily for accuracy and make necessary edits to reflect actual circumstances. Asset Management staff performs several validation screens monthly to catch other data entry errors. Reliability Engineering staff periodically review outage data and field crew comments as part of reliability improvement programs and when questionable data is encountered and works with Control Center staff to resolve remaining issues.

Analysis of Top Three Equipment Failure Modes[66]

This information identifies and analyzes the top three equipment failure modes in the District of Columbia. In addition, it identifies feeders for corrective actions to remediate these failures in the future based on root cause determination where appropriate.

For the period October 2013 through September 2014 inclusive of MEDs, the District of Columbia experienced 1,108 events attributed to equipment failures resulting in customer outages. In comparison to the previous 12-month period, the number of customers impacted decreased by 0.5%, resulting in an improvement in SAIFI, SAIDI and CAIDI by 1%, 18% and 14%, respectively. Similarly, the customer minutes of interruption also decreased by 18%.

For purposes of this analysis, the following definitions are established.

[65] Order No. 16975 states the following at paragraphs 95 and 118:

85. *Decision: In its Comments, OPC identifies several instances in which outage data is inconsistent or erroneous. Pepco itself has identified several areas in which it can improve outage data quality. In an effort to ensure that the Commission and OPC is receiving accurate outage data, the Commission requires Pepco to report in its 2013 Consolidated Report on its efforts to improve the collection and accuracy of information regarding outages.*

114. *Pepco is DIRECTED to report on outage data quality improvement consistent with paragraph [95] herein.*

[66] In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. *…(5)…If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.*

- Events – number of outage events
- CI – number of customers interrupted
- CMI – Customer minutes of interruption
- SAIFI – System Average Interruption Frequency Index
- SAIDI – System Average Interruption Duration Index
- CAIDI – Customer Average Interruption Duration Index

Table 2.4-I1 illustrates the aggregate impact of outages attributed to equipment failure and compares 2014 to 2013 results.

	12 Months Ending	Events	CI	CMI	Indices		
					SAIFI	**SAIDI**	**CAIDI**
Total Primary and Secondary Equipment	**Sep. 2014**	1108	94,741	15,181,349	0.363	60.61	167
	Sep. 2013	917	95,206	18,490,398	0.367	71.21	194

Table 2.4-I1 – Equipment Failure Rates

Replacement of Oil-Filled Switches in Pepco's 4kV System[67]

Pepco determined in 2012 that it would no longer install new 4kV oil-filled switches on its underground 4kV system. Since that time, Pepco has engaged in opportunistic replacement of oil-filled switches, replacing them with alternative devices whenever equipment condition or other relevant factors warrant removal.

[67] This section is intended to respond to the Commission's directive to " include information describing whether, in 2014, it conducted an investigation into programmatic replacement of oil-filled switches in its 4 kV system and, if such an investigation was conducted, the results of that investigation." *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 367 (February 27, 2015).

Table 2.4-I2 details the reliability impacts of equipment categories tracked by Pepco.

Table 2.4-I2 – Event Detail for Equipment Failures[68]

Based on the number of customers out, as shown above in highlighted rows, the top three classes of equipment failures contributing to SAIFI are cable, connection and joint failures, contributing to 63% of total customers impacted and to 63.7% total Customer Minutes of Interruptions due to equipment failures.

Cable Failure Analysis

Based on MED Inclusive OMS data, the District of Columbia experienced 400 outage causing cable failures during the period of analysis, which affected 32,443 customers contributing to 34% of the total customers affected due to equipment failure.

Months Ending	Mode of Failure: Cable Failure					
	Events	**Pct.**	**CI**	**Pct.**	**CMI**	**Pct.**
Sep. 2014	400	36%	32,443	34%	6,491,710	41%
Sep. 2013	281	31%	33,643	35%	8,141,970	44%

Table 2.4-J1 – Cable Failure Rates

Analysis of these 400 cable failure events as reported by OMS revealed that 53% of the customers impacted by cable failure can be attributed to 21 events, which affected 16 feeders. Out of the 16 feeders, 11 feeders have been identified as being part of an REP program. See summary below:

- Feeders 82, 117, 14017, 15085, 15170 and 15945 were selected as part of the 2015 Priority Feeder Program in the District of Columbia;
- Feeders 212, 14005 and 15130 were part of various programs in REP for 2014. Pepco expects reliability work done on these feeders will improve their performance in 2015;
- Feeders 309, 14731, 14786, 15206 and 15702 performance indices are either within or below the system average. No further actions are required at this time;
- Feeder 86 is part of Harvard conversion for 2016; and
- Feeder 14008 will be investigated further for possible addition to comprehensive work under REP for 2015.

Table 2.4-J2 – Event Detail for Cable Failures

Feeder	Substation	Neighborhood(s)	Date	CI	Cause	UG Miles	%UG	Cable Type	Comments

Connection Failure Analysis

Based on MED Inclusive OMS data, the District of Columbia experienced 194 connection related outages for the period of October 2013 through September 2014. These events affected 18,477 customers, contributing to 20% of the total customers affected due to equipment failure.

Months Ending	Mode of Failure: Connection					
	Events	**Pct.**	**CI**	**Pct.**	**CMI**	**Pct.**
Sep. 2014	194	18%	18,477	20%	1,898,590	12%
Sep. 2013	158	17%	15,113	16%	1,442,009	8%

Table 2.4-K1 – Connection Failure Rates

Analysis of these events as reported by OMS revealed that 68% of the customers impacted by connection failures can be attributed to six events on six feeders. All six events occurred on the main trunk of the circuit.

Below is the summary and breakdown of these events:

- Two events were attributed to breaker operation, affecting a total of 3,012 customers on Feeders 14132 and 15199;
- One event was attributed to wire down, where faulty connections were found to be the root cause. This event affected a total of 1,981 customers on Feeder15707;
- One event was attributed to burned bypass on the ACR. Crew opened feeder to make final repairs. This even affected 1380 customers on feeder 15172; and
- Two events were attributed to a connections failure while crews were working on feeder 15166 and 14717. This event affected a total of 6,153 customers.

Table 2.4-K2 – Event Detail for Connection Failures

Feeder	Substation	Neighborhood(s)	Date	CI	Cause	Device
15166	Alabama ave 136	Bolling Air Force Base, Randle Heights, Congress Heights, St Elizabeths Hospital	10/8/2013	1818	Outrugger broke causing feeder to trip. Feeder was on MM	BRKR804368-754459-2_15166
14132	Van ness 129	American University, Cleveland Park, Glover Archbold Parkway, Glover Park, Spring Valley, Wesley Heights	5/6/2014	1111	Faulty connection on URD pole cause Pothead to burn tripping feeder	BRKR777403-420913-1_14132

15172	Alabama ave 136	Barry Farms, Randle Heights, St Elizabeths Hospital	6/18/2014	745	Connection at ACR by-passe burned	Pole #804371-7531
15707	Benning a23013 7	Deanwood	6/22/2014	1981	Wire down due to faulty connection.	RCLR819389-190470_15707
14717	Benning a23013 7	DC Stadium, Deanwood, Lily Ponds	7/15/2014	4335	Tap burned while feeder was on MM. Feeder was tie to 15707	BRKR813387-876596-22_14717

Based on the above table, three out of the six feeders identified have recently had reliability work done or are on schedule as part of the Reliability Enhancement Plan for 2015.

See summary below:

- Feeders 14717, 15707 and 15199 were part of the 2014 REP work plan in the District of Columbia. As such Pepco believes the reliability of these feeders should improve during 2015; and
- Feeders 15166, 14132 and 15172 were addressed at the time of the event and their 2013-2014 performances indicate that these were isolated incidents and no further actions are needed at this time.

Joint Failure Analysis

According to OMS, for the period of October 2013 through September 2014, including MEDs, the District of Columbia experienced 31 events due to transformer failures. These events affected 8,792 customers contributing to 9% of the total customers affected due to equipment failure.

Months Ending	Mode of Failuer: Joint					
	Events	Pct.	CI	Pct.	CMI	Pct.
Sep. 2014	31	2.8%	8,792	9.3%	1,692,031	10.7%
Sep. 2013	13	1.4%	1,628	1.9%	238,777	1.5%

Table 2.4-L1 – Joint Failure Rates

Analysis of these events indicated that 61% of customers impacted by joint failures can be attributed to five events on five different feeders. For two of these events affecting 3,568 customers, the responding field crews found it necessary to open the feeders' breakers at the substation prior to initiating any work on the damaged feeder. It is important to note that opening the breaker to make repairs is generally done as a safety precaution and to comply with safety regulations.

Table 2.4-L2 – Event Detail for Joint Failures

Feeder	Substation		Neighborhood(s)	Date	CI	Cause	Device (s)
14722	Harvard13	13	Columbia Heights, Mt Pleasant	12/21/2013	1526	Joint failure at subway switch. Crew opened breaker to make permanent repairs	SSW790398-757866-4_14722

15021	Ft slocum	190	Brightwood, Chillum, Petworth, Shepherd Park	5/8/2014	2042	UG cable to pothead joint failed. Crew opened breaker to isolate fault.	LBSW792410-110580_15021
14146	Van ness	129	Garfield Massachusetts Avenue Heights, Observatory Circle, Rock Creek Park 1, Woodley	6/11/2014	572	ML joint failure	BRKR777403-420913-28_14146

Order No. 16975 states the following at paragraphs 68 and 109:

68. ***Decision:*** *Pepco is directed to report on efforts to reduce equipment failure in the 2013 Consolidated Report and in future Consolidated Reports.*

109. Pepco is ***DIRECTED*** *to report on its efforts to reduce equipment failure consistent with paragraph 68 herein;*

Analysis of effort to reduce equipment failure rates

The analysis of the top three causes of equipment failure outages in the District of Columbia shows the impacts of ongoing efforts to improve Pepco's overall system and the effectiveness of numerous programs currently in progress as part of Pepco's Reliability Enhancement Plan. As shown in the detail above, most of the issues that contributed to the top three equipment failure modes during the evaluation period have been or are scheduled to be addressed in various elements of the REP.

Historical data on SAIFI over the last 3 years shows evidence of improvement, as shown on Figure 2.4-B.

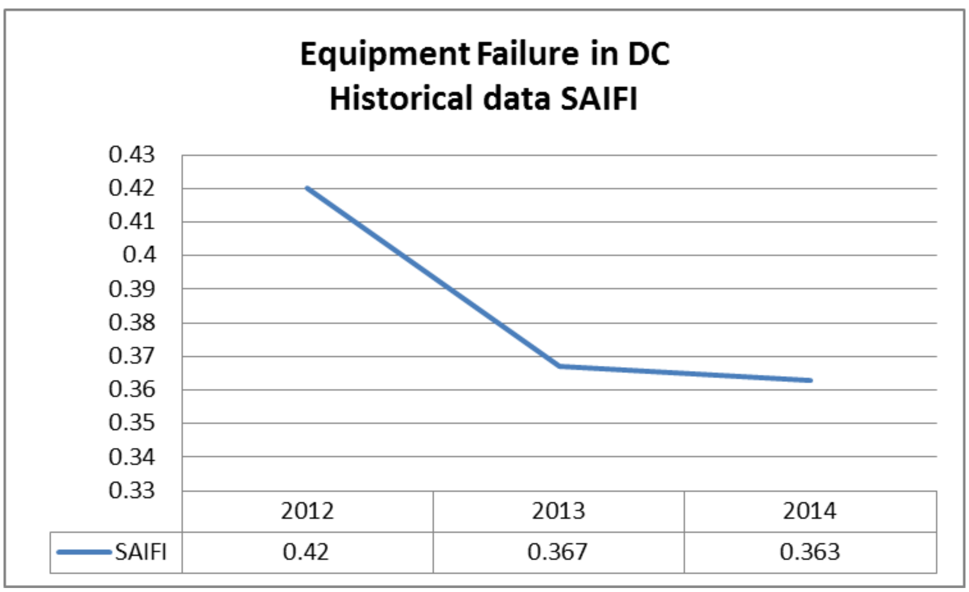

Figure 2.4-B

Improvements in the overall impact of equipment failures bear testament to the effectiveness of the REP in identifying and remediating the most impactful equipment failure modes, ideally those which contribute to the majority of customer outages.

As noted in the above analysis, cable failure remains the largest contributor to customer outages caused by equipment failure. From this analysis it was identified that one-fourth of those failures had a catastrophic effect on underground to overhead terminations or transitions. Also, it was identified that cable failure at the get-away pole on feeder 84 had a cascading that affected feeders 117 and 133.

Furthermore, analysis of connection and joint failure revealed three other events associated with failures at or near termination points from underground to overhead affecting 5,054 customers. As a result, these feeders have been referred to the failure analysis team for further analysis to determine if there is a pattern or trend that could result in potential failures or if these are isolated events.

2.4.5 OUTAGE CAUSES

Interruptions to electric service can be caused by a range of occurrences, such as downed trees or limbs on power lines; high winds and lightning; heavy rain, snow, or ice; animals on equipment or power lines; traffic accidents that damage poles and equipment; underground construction accidents; and equipment failures.

The eight main outage causes in the OMS are:

- Animal – Outage caused by contact between Birds, Squirrels, Snakes and Other small animals and the distribution system;
- Equipment Failure - Includes Equipment Failures Only;
- Equipment Hit - Includes Cable Cuts, Motor Vehicle Hits and Foreign Contact;
- Others - Includes Employee, Fire, Load Shedding, Source Lost, Vandalism, Voltage;
- Overload - Includes Overloading only;
- Tree - Includes Outside ROW- Limb, Outside ROW-Down, Inside ROW-Limb, and Inside ROW-Down;
- Unknown - Includes Unknown Only indicates that the field responder did not know the cause of the outage; and
- Weather - Includes Flood, Ice, Lightning, Wind.

The following table displays the outage cause options from which crews select when entering data into the Advantex Mobile application at the time of restoration. Through the Advantex Mobile NMS (Network Management System) completion window, crews have the ability to enter the event restoration information through drop down menus that are represented in the following table as well as any additional information through a free form text field. The outage cause selections are later classified into the categories above for reporting purposes. The detailed outage causes are maintained to assist in analysis of not only the cause of the outage but also the corrective actions necessary to reduce future outages.

An explanation of the selection categories from the drop-down menus follows Table 2.4-M below.

Table 2.4-M

- **Non PHI** - If the event is not caused by Pepco equipment or if it is impossible to complete the request (e.g. bad address) crews must select one item from the Non-PHI list box of the MDS restoration screen indicating the circumstances, such as other utility, customer equipment, APGE (advise party to get electrician). If a selection is made from this list, the crew can complete and close ticket without further information. If no selection is made, then the event is on Pepco equipment and additional information is needed to complete the record.
- **Weather** - Crew must select from the list the observed weather conditions at the time of the outage.
- **Class** - Crew must select one item from the drop-down list describing the construction type.
- **Device** - Crew must select the clearing device.
- **Action** - Crew selects the action taken to restore the event/outage.
- **Cause/problem** - Crew must select the cause of the event. A ticket cannot be closed without a cause selection if the event was on Pepco equipment.
- **Equipment Failure** - Crew must enter information about the failed device related to the event if equipment failure is the cause / problem selected.
- **Phase** - Selection box for the phase(s) impacted by the event/outage.
- **Manhole** - Selection box for items describing the contents of a manhole.
- **Follow-up Area -** For an event that needs additional work but does not require immediate attention, a crew may select a follow-up area. For example, in the case of a URD cable failure where all load is restored through a common tie, the event would have a follow-up selection.

The most common causes of power outages are equipment failures and vegetation-related. High winds, heavy rain or snow and ice can cause trees or branches to topple and tear down power lines. Tree limbs brushing or resting on the lines cause short circuits and blown fuses. Please note, as shown in Table 2.4-M, there are several different equipment types that fall under the “Equipment Failure” category. One such type is fuse-related outages. The job of the fuse is to protect equipment. If a fuse blows, it is not an equipment failure but rather the fuse is performing its designed function. As a result, there are fewer actual “Equipment Failures” than are captured by the OMS.

If a non-Pepco construction crew digs a foot or two in the wrong direction, damage to an underground power line could cause an instant disruption of electric service, or could cause damage that may not result in a power outage until days, weeks or months later.

Vehicles that damage utility poles or equipment can also cause power outages. Small animals, like squirrels, sometimes chew into lines or come into contact with a piece of equipment and an energized line, causing a fault and subsequent interruption of electric service.

An event classified as "Unknown" indicates that the field responder did not know the cause of the outage and this classification is used most frequently where a service interruption results from the operation of a protective device such as a fuse or recloser. These devices protect the electric distribution system from damage by sensing fault current on a particular circuit and activating a break in the flow of current. Typically, if there is no discernable damage to the circuit and the cause of the fault is not evident in the vicinity of the protective device that was activated, the device will be replaced or reset and the circuit re-energized. If the device holds (no fault current is detected), the field responder may report “Equipment Failure” or "Unknown" as a cause and move on to the next trouble call assigned. The operation of these protective devices are not equipment failures because the fuse or recloser is operating correctly when it opens to isolate a fault further down the line. Occasionally, the field responder may find a probable cause some distance from the protective device involved (such as a tree branch on the ground underneath the overhead lines), but, for the most part, crews are focused on restoration of service rather than full investigation of the cause of any interruption (where this is not immediately evident).

Table 2.4-N1/N2 contains District of Columbia outage cause data for calendar year 2014. Note, there were no Major Service Outages in 2014. Table 2.4-N3 presents calendar year 2014 District of Columbia equipment failure statistics exclusive of Major Service Outages.

Table 2.4-N2

2.4.6 VM BUDGET, TREE-RELATED OUTAGES[69] [70]

Table 2.4-O1 shows District of Columbia distribution tree trimming expenses (not including poles, substation mowing, or storm-related tree trimming) and budgets. Provided are actual and budgeted amounts for 2007-2014, the 2015 budget, and the preliminary 2016 and 2017 budgets.

Pepco's VM program includes increased trimming above all three-phase and single-phase lines. For three-phase lines it also includes the removal (with permission) of any limbs identified by Pepco Arborist planners that have a probability of breaking and falling into the conductors.

[69] In Order No. 16623 at paragraphs 37 and 56, the Commission ordered the following:

37. Decision: …We require Pepco to explain why it has decreased its budget for tree trimming over the last seven years, if tree trimming is the most important factor impacting customers suffering from power outages. Pepco should include that explanation in the 2012 Consolidated Report.

56. Pepco is DIRECTED to provide an explanation of its budget for tree trimming consistent with paragraph 37.

[70] Order No. 16975 states the following at paragraphs 43 and 99:

43. Decision: The Commission finds Pepco's explanation of its budget variance for the single year 2011 insufficient to explain budget variances that totaled 26.9% below budget for five of the last six years. Therefore, the Commission requires Pepco to explain the budget variances that have occurred from 2006-2011 in its 2013 Consolidated Report. Additionally, we agree with Staff Recommendation #3 and require Pepco to include an explanation of any budget variance in its vegetation management expenditures and its EIVM expenditures in future years' Consolidated Reports. We are extremely concerned about the explanation provided in the Consolidated Report for why vegetation management expenditures were below budget in five of the last six years. Pepco stated that "while actual expenditures were below budget, work was completed consistent with planning.*" This is an inadequate explanation for a repeated failure to spend budgeted amounts on tree-trimming – arguably, the "most important factor impacting customers suffering from power outages." We therefore require Pepco to expand upon its explanation. If Pepco means that, through efficiencies, all the work intended to be accomplished in the budget was actually accomplished for less, then we direct Pepco to document what was intended to be included in the budget and what efficiencies were achieved so that the budgeted work was accomplished at a lower cost. The Commission also requires Pepco to explain what impact these efficiencies had on the budget process in subsequent years. If Pepco's statement about planning has some other meaning, we direct Pepco to provide it and to show what "planning" was involved, by whom and when. We also expect a precise and detailed explanation of why such planning would result in expenditures consistently, and significantly, below the budgeted amounts for a number of years. Further, we agree with OPC's suggestion that Pepco explain why its program does not include increased trimming above the three phase tap line or the single tap lines. Pepco is directed to provide this information in the 2013 Consolidated Report.*

99. Pepco is DIRECTED to provide an explanation of budget variances for its own vegetation management work as directed in paragraph 43 herein;

Explanation of Variance in Pepco D.C. O&M Tree Trimming Costs

In both 2013 and 2014, annual O&M actual spending for VM was in excess of the annual budgets. Table 2.4-O1 shows that the 2014 actual Pepco D.C. O&M tree trimming costs were approximately $2.16 million, compared to a budgeted amount of approximately $2.11 million. The variance between budgeted and actual costs for Pepco D.C. O&M tree trimming was $51,036 (or approximately 2%).

Pepco District of Columbia O & M Tree Trimming Costs

	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016

Notes:
1. Excludes pole inspections, substation mowing costs

Table 2.4-O1

Yearly Data on Tree Trimming & Tree-Related Outages

In accordance with Order No. 15621,[71] presented in the following tables, is Pepco's "yearly data on vegetation management by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports." The first set of tables lists the feeders that were worked in 2014, sorted by feeder. These tables include the date that vegetation management was completed on the feeder as well as the wards that the feeder serves. The second set of tables lists the outages coded as tree-related in 2014, also sorted by feeder, allowing for a comparison between the two sets of tables. It is possible that additional outages may have been caused by trees but with causes coded as weather or unknown if fallen trees or limbs were not found at the site.

[71] In Order No. 15621 at paragraph 5, the Commission ordered the following:

> *5. Pepco shall file within the Company's annual Consolidated Reports to the Commission, yearly data on tree trimming by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports beginning with the Company's 2010 Consolidated Report.*

Table 2.4-P2 (continued)

2.4.7 ELECTRICITY QUALITY OF SERVICE STANDARDS (EQSS)

The Commission introduced the EQSS to establish standards and requirements for ensuring that electric utilities operating in the District of Columbia meet an adequate level of quality and reliability in the electric service provided to District residents. On February 29, 2008, the Commission issued a Notice of Final Rulemaking (NOFR) on the EQSS. The EQSS are now adopted as Chapter 36, Electricity Quality of Service Standards in Title 15 of the District of Columbia Municipal Regulations. Subsequently on July 25, 2008, the Commission issued a NOFR on Compliance Reporting. Pepco and all electricity suppliers within the District of Columbia were directed to collect EQSS data on a monthly basis and retain the reporting data for seven (7) years. Further, quarterly submissions, containing monthly data, are to be filed with the Commission on April 30, July 30, October 30 and January 30 for the prior three (3) months respectively. Specific Consolidated Report requirements from the EQSS portion of the D.C.M.R. are listed below.

3602.6 Progress on current corrective action plans [on customer calls answered] shall be included in the utility's annual Consolidated Report.

3602.7 The utility shall report the actual call center performance during the reporting period in the annual Consolidated Report of the following year.

3602.12 Progress on any current corrective action plans [on call abandonment rates] will be included in the utility's annual Consolidated Report.

3602.13 The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3602.14 The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.

3602.21 Progress on any current corrective action plans [on new residential service installation requests] will be included in the utility's annual Consolidated Report.

3602.22 The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3603.5 The utility shall report on the progress of the corrective action plan [on repeat least performing feeders] in the Annual Consolidated Report submitted to the Commission.

3603.8 The utility shall report on the number and percentage of non-major service outages that extend beyond the twenty-four (24) hour standard and the reasons each such outage extended beyond the twenty-four (24) hour standard.

3603.9 The report drafted pursuant to Section 3603.8 shall be included in the annual Consolidated Report on reliability data.

3603.16 The utility shall report on the progress of the corrective action plan [on SAIFI, SAIDI and CAIDI benchmarks] in the annual Consolidated Report submitted to the Commission.

3603.17 The utility shall also, per the orders of the Commission, continue current requirements of reporting annual reliability indices of SAIFI, SAIDI and CAIDI (with and without major events) in the annual Consolidated Report of the following year.

Electricity Quality of Service Standards Results

January – December 2014 Aggregate Totals

3601	Reporting Requirements for Service Outages, Incidents and Power Quality Complaints						
Standards			2014 Aggregate Totals				
Section	Standard	Measure	Total # of Events	% Compliant (w/measure)	Corrective Action	Due Date	Status
3601.2/ 3601.6	Report major and non-major service outages by telephone and e-mail within one (1) hour after the utility has determined that a major service outage occurred or after the utility becomes aware of the incident.	Report by telephone and e-mail **within one (1) hour.**	378	99%	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 29, 2014; July 30, 2014; October 30, 2014; and January 30, 2015.		
3601.3/ 3601.8	Each telephone and e-mail report on major and non-major outages should contain a) the location, b) Wards affected, c) # of customers out of service, d) cause of the outage, e) the estimated repair time, and, for major outages, f) notification of progress to major outage status.	Each 3601.3 report must contain **(a) - (f)**, each 3601.8 report must contain **(a) - (e)**.	378	99% (Except for ward data)	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 29, 2014; July 30, 2014; October 30, 2014; and January 30, 2015.		
3601.4	Report periodically (frequency to be determined by the Commission's Office of Engineering) regarding the status of the major service outage.	**TBD**	NA	NA			

3601	Reporting Requirements for Service Outages, Incidents and Power Quality Complaints						
Standards			2014 Aggregate Totals				
Section	Standard	Measure	Total # of Events	% Compliant (w/measure)	Corrective Action	Due Date	Status
3601.5	Specific restoration information, including restoration times, shall be provided to District customers by customer service representatives and the automated voice response unit.	**TBD**	NA	NA			
3601.9/ 3601.11	Report by telephone all manhole incidents (smoking manholes, manhole fires, manhole explosions) and all incidents that result in the loss of human life and/or personal injury requiring hospitalization within thirty (30) minutes upon receiving notice of the incident.	Report **within 30 minutes** of receiving notice of incident.	77	96%	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 29, 2014; July 30, 2014; October 30, 2014; and January 30, 2015.		
3601.10/ 3601.12	Telephone and e-mail reporting of incidents to include: a/b) location/description of the incident, b/c) Ward, c/d) customers and/or persons affected, d/e) cause of incident, e) estimated repair and/or restoration time (for manhole incidents), and f) steps utility will take to provide assistance (for personal injury incidents).	**Each 3601.10 report must contain (a) - (e)**, each 3601.12 report must contain **(a) - (f)**.	77	96% (Except for ward data)	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 29, 2014; July 30, 2014; October 30, 2014; and January 30, 2015.		

3601	Reporting Requirements for Service Outages, Incidents and Power Quality Complaints						
Standards			2014 Aggregate Totals				
Section	Standard	Measure	Total # of Events	% Compliant (w/measure)	Corrective Action	Due Date	Status
3601.13/ 3601.15	Written reports concerning non-major service outages and/or manhole incidents shall be submitted to OE and OPC within five (5) days from the date of the event occurrence. Written reports on the loss of human life/personal injury shall be submitted within five (5) days of receiving notice of the incident.	Submit 3601.13 report **within 5 days of event,** and 3601.15 report **within 5 days of receiving notice.**	455	100%			
3601.14/ 3601.16	At a minimum: each written report on non-major service outages and/or manhole incidents shall state, a) description, b) location, c) Wards, d) time of the outage, e) repair and restoration times, f) duration of outage(s) in hrs/min., g) total # of customers, h) total # of manholes, i) classification of the manhole incident(s); each written report on loss of human life and/or personal injury shall state, a) description, b) location, c) Ward, d) exact time, e) total # of customers, f) assistance steps, g) time it took assistance to arrive, h) steps to prevent reoccurrence.	Each 3601.14 report must contain **(a) - (i)**, each 3601.16 report must contain **(a) - (h)**.	455	100%			
3601.17	Provide a detailed report on non-major service outages, manhole incidents, and/or incidents that result in the loss of human life or personal injury to the Productivity Improvement Working Group (PIWG) every quarter.	Submit all applicable reports to the PIWG **every quarter**.	4	100%

3rd Qtr. Aggregate				
	3601.9/3601.11	19	17	Total number of Events reduced by 2 due to above. Percent compliant changed from 85% to 82%
	3601.10/3601.12	19	17	Total number of Events reduced by 1 due to above. Percent compliant changed from 85% to 82%
	3601.13/3601.15	146	144	Total number of Events reduced by 2 due to above.
	3601.14/3601.16	146	144	Total number of Events reduced by 2 due to above.

New Residential Service Installation Requests

In 2014, Pepco completed 99% (306 of 307) of the new residential service installation requests received for the District of Columbia in accordance with Section 3602.14 of the EQSS as stated below.

> *The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.*

As a result of not achieving 100% for this standard for 2014, in accordance with Section 3602.21 in the EQSS, Pepco is required to report on the progress of any current correction action plans in the Company's annual Consolidated Report. As reported in Pepco's May 15, 2014 filing in FC Nos. 982 and 1002, corrective action includes addressing data entry issues with the responsible employee(s).

Quarters	Percentage of New Residential Service Connections Made in Accordance with Section 3602.14 of EQSS	
	CY 2013	CY 2014
1st	100%	99%
2nd	98%	100%
3rd	96%	100%
4th	100%	100%

Table 2.4-Q

Non-Major Outages, Restoration Completion Within 24 Hours

In accordance with Section 3603.8 in the EQSS, Pepco is to include in the Consolidated Report the number and percentage of non-major customer outages that extend beyond the 24 hour standard and the causes for these extended service outages. A Major Service Outage in the District of Columbia, as defined in Section 3699.1, Definitions, of the EQSS states, "*customer interruption occurrences and durations during time periods when 10,000 or more of the electric utility's District of Columbia customers are without service and the restoration effort due to this major service outage takes more than 24 hours.*" Tables 2.4-R and 2.4-S provide the required information.

For 2014, there were 11 (out of 378) non-major outages (3%) that extended beyond 24 hours.

Percentage of Non-Major Outages that Extended Beyond 24 Hours

Total number of Non-Major Outages extending beyond 24 hours	11
Total number of Non-Major Outages: January 1 - December 31, 2014	378
Percentage of Non-Major Outages extending beyond 24 hours	3%

Table 2.4-R

Report Sequence Number	Outage Sequence Number	Manhole Sequence Number*	Month	Day of Outage	OH or UG	Outage Cause/ Incident Description	Location	Quadrant	Ward	Time of Outage/ Incident	Actual Restoration Time	Duration of Outage Hours	Duration of Outage / min	Max No. of Cust. Affected	Reason for Outage Exceeding 24 Hours to Restore	Feeder No.
21	52		February	13	UG	Equipment failure/Secondary service cable failure/ Replaced service cable	1300 Michigan Avenu	NE	5	1559	2114 (2/14)	29	15	1	The extended outage on feeder 14007 was due to the cold temperatures', snow and ice from 2/12/14 through 2/14/14. At 15:59 on 2/13/14 a customer reported no lights. At 17:05 on 2/13/14 the lead line mechanic reported a dead leg inside the meter and the service is fed underground. The underground crews replaced the service cable and all load was restored at 21:14 on 2/14/14.	14007
21	53		February	13	UG	Equipment failure/Customer had partial service/ Crew found neutral off in manhole/Permanent repairs made	300 block of 17th Stre	SE	6	1740	2300 (2/14)	29	20	1	The extended outage on feeder 208 was due to the cold temperatures', snow and ice from 2/12/14 through 2/14/14. At 17:40 on 2/13/14 a customer reported partial service. The UG Crew found a neutral off in the manhole. Permanent repairs were made by splicing the neutral. The customer's load was restored at 23:00 on 2/14/14.	208
44	94		March	21	UG	Equipment failure/Secondary cable fault/Feeder tripped/On 3-22-14 at 0015 hrs. Underground completed temporary repairs/At 0305 hrs. received reports of partial current/Second fault located/Replaced cable/All load restored	16th Street and Newton Street, NW	NW	1	1847	0549 (3/23)	35	2	337	The extended outage on feeder 86 was due to multiple faults on the feeder. At 18:47 on March 21, 2014 feeder 86 tripped. At 20:32 on March 21 the UG Crew Located a fault in the cable joint and start preparations for the repair. On March 22, 2014 at 00:15 the crew completed temporary repairs to feeder 86 and restored load. At 0305 reports of partial current were received. CR& T located the second fault at 13:05. The UG Crew started repairs of second fault at 15:00 on March 22, 2014. Two sections of cable were removed . There were problems removing second section of cable. On March 23, 2014 the second section of cable was installed and splicing completed at 05:00. All load was restored at 05:49 on March 23, 2014.	86
57	118		April	22	UG	Dig in/Cable and conduit damaged/Blown fuse/Temporary repairs made/Referred to Conduit Department to repair duct/Load restored	4th and College Streets, NW	NW	1	1525	2029 (23)	29	4	3	4-22-14 A report of a cable cut due to contractors working E/O 4th and College Streets, NW. The Pepco crew responded at 18:00 hrs. The crew isolated the cable cut and made temporary repairs, the crew assumed they restored all load. Their were no reports of partial service. The parties involved were not aware of a 150 E fuse was blown until 4-23-14 at 08:30 hrs While inspecting job for permanent repairs. The Crew re[placed the fuse and all load was restored at 15:02 hrs.	14004
61	130		April	30	UG	Equipment failure/Partial service/Secondary service failed/Replaced secondary service/All load restored(Note: could not get access to neighbor's yard to locate problem)	2600 block of Sherman Avenue, NW	NW	1	1156	2100 (5/1)	33	4	1	This was a complaint dispatched to the trouble truck on 4/30. The crew found a pipe bus with no access, the house was under renovation with no occupants this was referred to Service crew in the morning on 5/1. The Burns box (connection point) was blocked by construction debris. Once access was established, the service duct was found broken down and conduit was needed to repair the duct line, the General shops was also needed to cut wooded planks installed as a porch. This was all very time consuming.	4729

63	135		May	1		Equipment failure/transformer failed/Replaced transformer	600 block of Monroe Street, NE	NE	5	905	1943 (5/2)	34	38	1	On 5/1/14 a Pepco employee was sent to investigate a partial current @ 625 Monroe St. N.E. There are 4 subsurface transformers @ that location feeding 4 different switchboards. The transformer in question 800399-673864 a 750 kva subsurface transformer on feeder 14200 had blown 2 fuses in the previous couple of days. The Underground Department decided to have CR&T meager the service. They identified 1 set of 500 service cable that would not meager. We hooked the remaining 6 sets up and re-energized and blew the fuse again. Removed the secondaries and fuse blew again. We replaced the 750 kva transformer restoring, all load. This transformer was installed last year this also, happened after the last major rain storm.	14200
97	225		July	3	OH	Vegetation/Tree limb/Wire down/Fuse blown/Reinstalled wire/Replaced fuse	3500 Block of Overlook lane, NW	NW	3	1635	1954 (7/4)	27	19	7	Due to the outages cause by the storm on July 3, 2014, Pepco was not able to assign a crew to this location until the following day. The OH crew found an 85a line fuse blown because of the primary wire down between poles due to a tree limb. The crew reinstalled the wire and replaced the fuse restoring the load at 19:54 hours on July 4, 2014.	64
97	227		July	3	OH	Vegetation/Tree limb/Wire down/Reinstalled wire	4200 block of 52nd Street, NW	NW	3	1626	1649 (7/4)	24	23	11	Due to the outages cause by the storm on July 3, 2014, Pepco was not able to assign a crew to this location until the following day. The OH crew found several spans of primary wire down between poles due to a tree limbs. The crew reinstalled the wire, restoring the load at 16:49 hours on July 4, 2014.	144
97	236		July	3	OH	Vegetation/Tree limb/Wire down/Permanent repairs made	16th Street and Tuckerman Street, NW	NW	4	1646	1739 (7/4)	24	53	8	Due to the outages cause by the storm on July 3, 2014, Pepco was not able to assign a crew to this location until the following day. The OH crew found the secondary bus and the primary wire down between poles due to a tree limb. The crew made permanent repairs restoring the load at 17:39 hours on July 4, 2014.	15021
98	246		July	4	UG	Equipment failure/Trans closure failure/Cable failure/Fuse blown/Isolated trans closure and cable fault/Closed tie/Replaced fuse/All load restored	Wisconsin Avenue and Rodman Street, NW	NW	3	2035	0303 (7/6)	30	28	196	The extended outage on feeder 14136 was due to a cable faults on the feeder. The crew arrived at 12:15 am on July 15,2014 isolated the fault and closed the tie restoring load. The UG crew reported that the porcelain insulator in trransclouser fell apart while replacing fuse. The transcoluser was replaced at 12:59 on July 5, 2014. The fuse was replaced and closed blowing the fuse due to another cable fault. The fault was isolated the fuse replaced, restoring the load at 03:03 on July 6, 2014.	14136
	329	DC14-68	Septembe	22	UG	Equipment failure/A fuse box and two oil switches damaged when concrete collapsed into the vault /Feeders tripped/Permanent repairs made/load restored	1700 block of East C	NE	6	1922	0301 (9/24)	31	39	5	On September 22, 2014 at 19:22 Feeder 14804 and14154 tripped. At 19:32 the DCFD reported an explosion in the 1700 block of East Capitol Street, NE. At 20:22 MO arrived on location and reported that the manhole had caved in. Upon arrival the UG crew reported that two oil switches were blown off the wall with slabs of concrete and exposed cable in the manhole. Permanent repairs were made and at 01:39 on September 24, 2014 the VLF testing was performed on the feeder. At 03:01 on September 24, 2014 the feeder passed the VLF testing. At this time the feeder was closed, restoring all load.	14145, 14804

Table 2.4-S (con't): 2014 Non-Major Outages Extending Beyond 24 Hours

PART 3: 2014 MANHOLE EVENT REPORT

PART 3: 2014 MANHOLE EVENT REPORT[72]

Part 3 of the Consolidated Report includes manhole event information, underground failure analysis results, detail tracking trends in reportable events based on manhole cover type, and Pepco's cable splice records for 2014. The appendices provide detail regarding manhole events, Pepco's manhole inspection program, and Pepco's Network Accuracy Procedure implementation.

[72] In Order No. 16091 issued on December 10, 2010, the Commission stated at paragraphs 56, 59, 65, and 66 the following:

56. Decision. Pepco has agreed to make the recommended changes in the 2011 Consolidated Report with the exception of data on failure rates. We require that the members of the PIWG discuss the need for and feasibility of providing data on failure rates in future Consolidated Reports and include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

59. Decision. We adopt the Staff's recommendation and require Pepco to: (1) combine the Manhole Events portion of the failure analysis report with Part 3 of the Consolidated Report; (2) include data in the 2011 Consolidated Report that separates 4 kV primary failures from 13 kV primary failures; (3) include data in the 2011 Consolidated Report that separates 4 kV from 13 kV manhole events; (4) include trend analyses for "Use of Slotted Manhole Covers;" and (5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable. If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

65. Pepco IS DIRECTED to include a discussion of failure data rates in the agenda for the Productivity Improvement Working Group, consistent with Paragraphs 56 and 59 of this Order; and

66. Pepco IS DIRECTED to include additional Manhole Event data in the 2011 Consolidated Report, consistent with Paragraph 59 of this Order.

In Order No. 15152 paragraphs 76 and 66, the Commission ordered the following:

76. PEPCO is DIRECTED to include as part of the 2009 Consolidated Report a proposed plan for significantly reducing manhole events consistent with paragraph 66 of this Order…

SECTION 3.1 – 2014 MANHOLE EVENT INTRODUCTION

Pepco herein submits its annual Manhole Event Report for 2014 in accordance with Order Nos. 11716, 13812, 15620 and 16091.

Summary of 2014 Manhole Events

During 2014, there were a total of 77 reportable manhole events in the District of Columbia. Of these 77 manhole events, 59 were classified as Smoking Manholes (S), 13 were classified as Manhole Explosions (E), and 5 were classified as Manhole Fires (F). Sixty-six of the 77 events occurred on the 13 kV system. Of these, 49 were classified as Smoking Manholes (S), 12 were classified as Manhole Explosions (E) and 5 were classified as Fires (F). Of the ten events occurring on the 4 kV system, ten were classified as Smoking Manholes (S) and one was classified as a Manhole Explosion (E). Appendix 3A is a list of the 2014 manhole events, categorized and described as directed in Order Nos. 11716, 15620 and 16091.

SECTION 3.2 – UNDERGROUND FAILURE ANALYSIS

Order No. 17074 Requirement

Order No. 17074 states the following at paragraphs 38 and 40:

38. *The Order further noted OPC's statement that according to Pepco, its replacement program would screen all feeders by collecting the number of underground faults experienced by each feeder in the last ten years and feeders with five or more faults ("5-in1-10") would be further analyzed for replacement. [Footnote: See F.C. 766-ACR-12, Order No. 16975, paragraph 75.] …Thus, we direct Pepco to report on the results of its screening program along with Pepco's recommendations for further analysis and replacement in the ACR starting with 2013.*

40. *… Some progress should have been made in the development of a tracking mechanism for PILC actual replacement and Pepco should be able to report on the actualization of its strategy with data that will help the Commission to better understand Pepco's future plans for PILC replacement and examine the results of its PILC Replacement Strategy. Thus, the Company is required to report on the actualization of its PILC Replacement Strategy in the ACR and to include in the report the information identified in Recommendations 8(c), (d) and (e). If the requested information is not available, Pepco shall provide a reasonable substitute that will allow the Commission to assess the progress that Pepco has made and intends to make in the implementation of its PILC Replacement Strategy for the ten-year period from 2012 to 2021.*

Pepco Response – Corrective Actions

Pepco is currently in the process of analyzing available data of the underground electric system faults in the District of Columbia over the ten-year period from December 2004 through December 2014. Feeders with at least five faults within 10 years were identified for further analysis. From that list of feeders, those that are already being addressed as part of Pepco's Reliability Enhancement Plan and/or other strategies—or programs that would address these issues on the feeders—were removed to avoid duplication of efforts.

In 2014, five feeders were selected through this process as potential candidates for targeted replacement. Preliminary evaluations of these five feeders yielded approximately 13,200 feet of PILC for possible replacement. Further field investigation revealed that approximately 5,000 feet of PILC have already been replaced with solid dielectric cable EPR or flat strap. See Table 1 for details.

Table 1: PILC replacement Status.

Year	Feeder ID	Location		Cable Length		Status	Est. Completion date	Comments
		Ward	Streets	Planned (ft)	Actual (ft)			
13	14150	3	Rodman St, Wisc Ave	4,204	5,375	In Construction	6/1/2015	DSO will not allow outage until weather conditions improve

14	15755	6	3rd and I Sts	1600-5000	-	Closed	-	Entire Feeder is EPR cable.

In Pepco's 2001 "Alternative Design Proposal to Pepco's 15kV Paper Insulated Lead Covered Power Cables (PILC)" study, Pepco estimated there were 1,109 miles of primary lead cables on the Pepco system in the District of Columbia. Given the current configuration of the

District of Columbia underground system, which includes varied duct and manhole sizes, it is not possible know how many of those miles are non-replaceable. Reconfiguring the manholes and ducts would allow most of Pepco's PILC cable to be replaceable, albeit at significant cost and time. As stated in Pepco's PILC Replacement Strategy, in line with most other electric utilities and with industry best practice, Pepco has not committed to replacing a fixed number of miles of PILC each year and has not identified a year by which full replacement of primary PILC would be expected. Instead, Pepco is seeking opportunistic replacement based on conditions, which it expects to be a more cost-effective replacement strategy.

Consequently, although Pepco cannot provide an estimate of the number of miles of PILC that will be replaced by EPR for the 10 year period from 2012 through 2021, Pepco can show progress in the actualization of its PILC replacement strategy, as demonstrated in the following table.

Years	***PILC Replaced Footage***	***PILC Replaced Mileage***

Underground (UG)Failure Analysis

The results of Pepco's annual UG failure analyses are presented below, in compliance with Order No. 12735 paragraph 138. [73]

In analyzing the performance of the Pepco UG system, it is necessary to distinguish three different measures of system performance:

- Equipment Failures
- Outages
- Reportable Events (RE)

An RE is a reported explosion, fire, or smoke in a manhole. Some Pepco equipment failures may result in customer outages, REs or both. However, not all Pepco equipment failures result in an outage and/or an RE. This is due to the redundancy of some components of the system, especially on secondary networks. In fact, for the underground secondary networks, most equipment failures do not result in customer outages because each network is fed by multiple primary feeders, and each customer can be fed from multiple transformers and secondary mains, making them less susceptible to outages. Further, some underground outages or events are not initiated by equipment failures, but are in fact caused by accidents, such as dig-ins by excavation contractors, failures of non-Pepco equipment, such as District of Columbia owned streetlight cables or gas company equipment.

There are three types of manhole reportable events:

- Explosions
- Fires
- Smoking

Of these three types, from 2010– 2014 smoking manhole events account for 58% - 77% of all manhole events experienced in the District. See Figure 3.1.

[73] In Order No. 12735, paragraph 138, the Commission ordered the following:
138.Pepco shall file a report that summarizes the results of the failure analyses conducted for the calendar year 2002, 30 days from the issuance date of this Report and Order, and subsequently, to file an annual report on the results of the failure analysis group to the PIWG;

	2010	2011	2012	2013	2014
All Events	111	84	50	56	77
13kV Smoking	71	50	25	34	49
4kV Smoking	11	9	4	3	10
% Smoking	74%	70%	58%	66%	77%

Figure 3.1: Manhole Events - Smoking (2010-2014)

For the same time period, manhole explosions account for 17% - 36% and manhole fires account for 4% - 6% respectively. See Figures 3.2 and 3.3.

	2010	2011	2012	2013	2014
All Events	111	84	50	56	77
13kV Explosions	25	21	17	13	12
4kV Explosions	0	1	1	4	1
% Explosions	23%	26%	36%	34%	17%

Figure 3.2: Manhole Events - Explosions (2010-2014)

	2010	2011	2012	2013	2014
All Events	111	84	50	56	77
13kV Fires	4	2	1	0	5
4kV Fires	0	1	2	0	0
% Fires	4%	4%	6%	0%	6%

Figure 3.3: Manhole Events - Fires (2010-2014)

Since 2008, the majority of the manhole events experienced in the District have occurred on Pepco's secondary equipment. See Figure 3.4.[74]

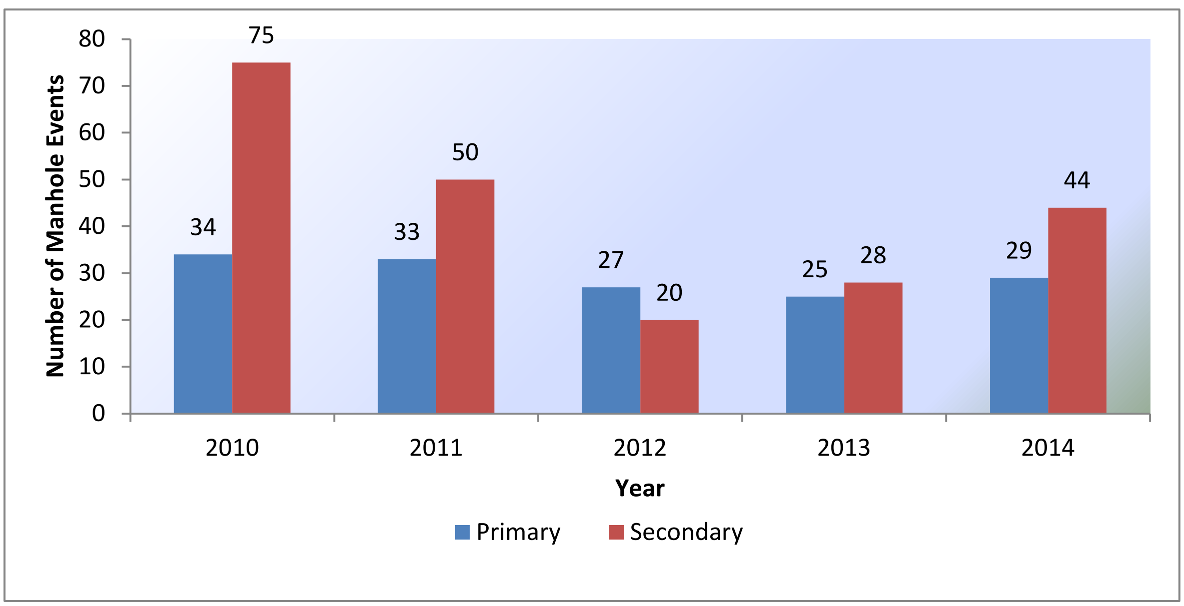

Figure 3.4: Manhole Events by Type of Equipment (2010-2014)

[74] Note: Non-Pepco equipment failures are not included in the following annual totals, and 2010 data has been corrected (Miscellaneous events in 2010 were mislabeled as primary).

As in previous years, most of the smoking manholes occurred on the secondary system, while most manhole explosions occurred on primary equipment. See Figure 3.5.

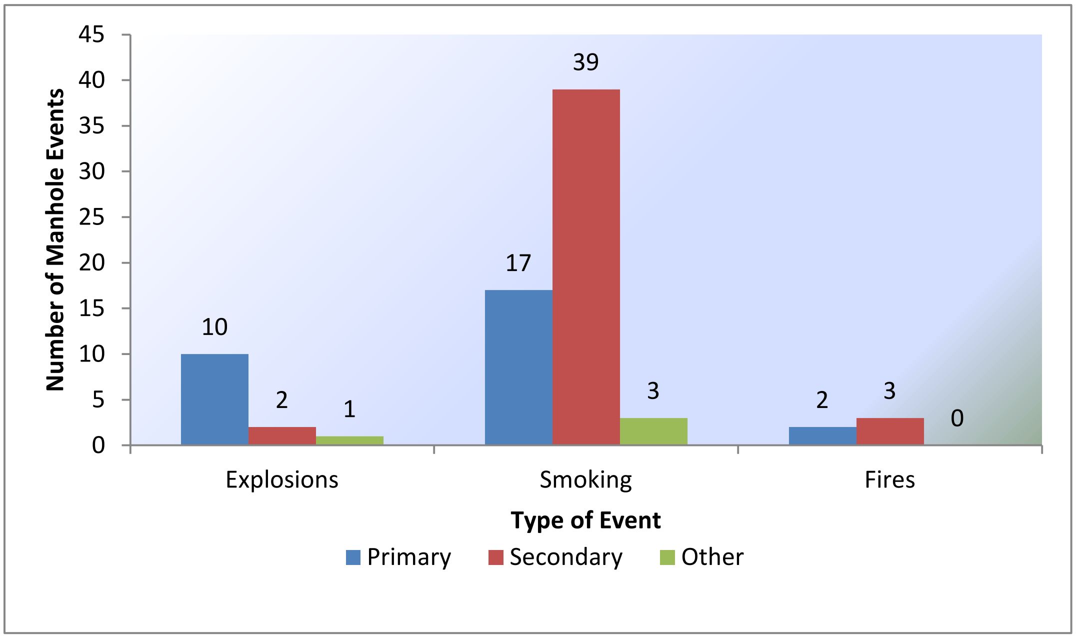

Figure 3.5: Manhole Events by Type and Equipment (2014)

Slotted manhole covers are designed to minimize the frequency and impact of manhole events by allowing gas and smoke to vent from manholes in the event of an underground failure. This provides an early warning and prevents build-up of gases to potentially explosive proportions; thereby allowing energy to disperse more easily should an event occur. The tradeoff when installing slotted covers is that they allow more water and street run-off contaminants to enter into the manhole than solid covers. From 2010 through 2014, most of the reportable events occurring in manholes equipped with a slotted cover involved secondary equipment and were manhole smoking events. See Figure 3-6 and Figure 3-7.

	2010	2011	2012	2013	2014
Solid Primary	26	24	18	21	20
Solid Secondary	41	28	9	15	24
Slotted Primary	2	4	1	0	9
Slotted Secondary	29	20	5	10	18
Grated Primary	6	5	8	4	0
Grated Secondary	5	2	6	3	2

Figure 3.6: Manhole Events by Type, Equipment, and Manhole Cover (2010-2014)

	2010	2011	2012	2013	2014
Slotted Smoking	29	23	6	10	17
Slotted Fire	0	1	0	0	4
Slotted Explosions	2	0	0	0	7

Figure 3.7: Slotted Manhole Events by Type (2010-2014)

By design, primary cable is more insulated than secondary cable. Whereas primary cable and its accessories are designed to their voltage rating and are shielded, secondary cable and its accessories are not shielded. As a result of less physical protection, secondary cable and its accessories are more likely to fail due to a breach in the insulation. Since 2010, the leading cause of manhole reportable events in the District is insulation-related, such as insulation deterioration. See Figures 3.8 through 3.12.

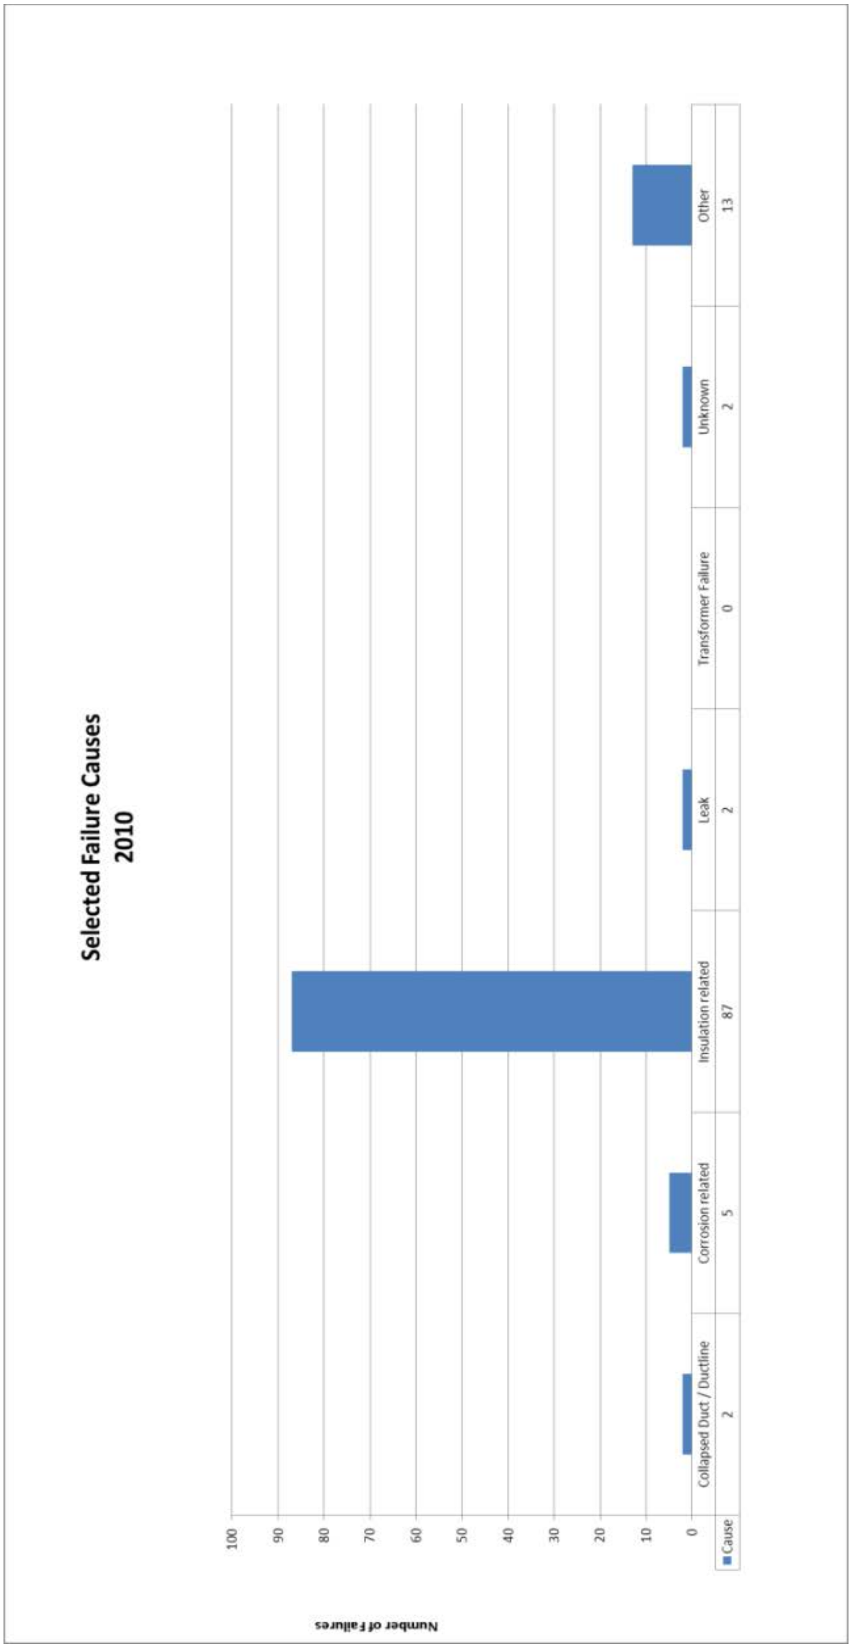

Figure 3.8 Selected Failure Causes (2010)

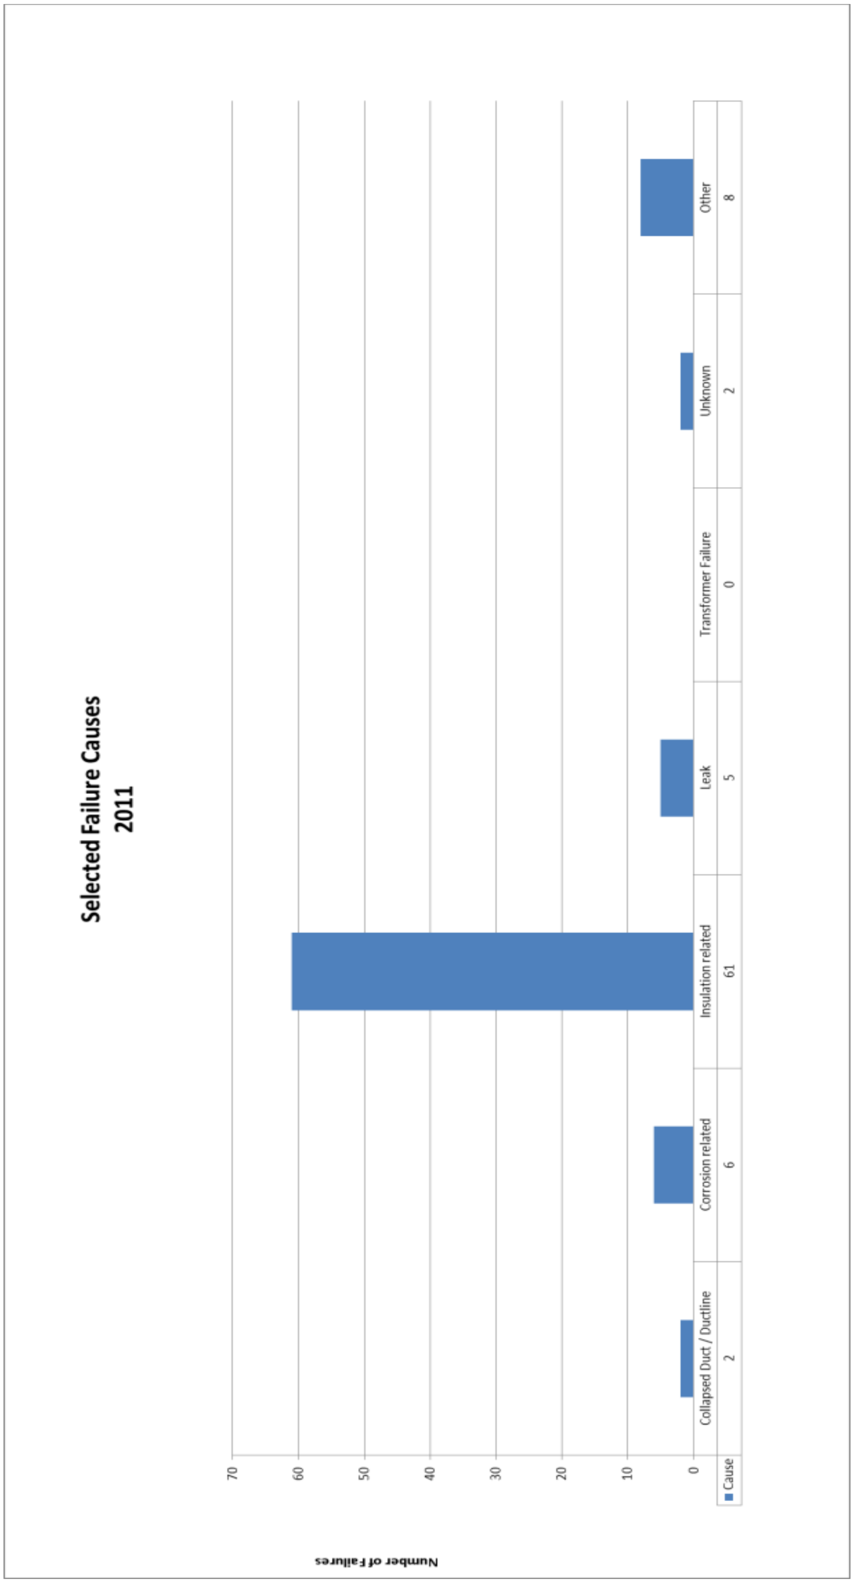

Figure 3.9: Selected Failure Causes (2011)

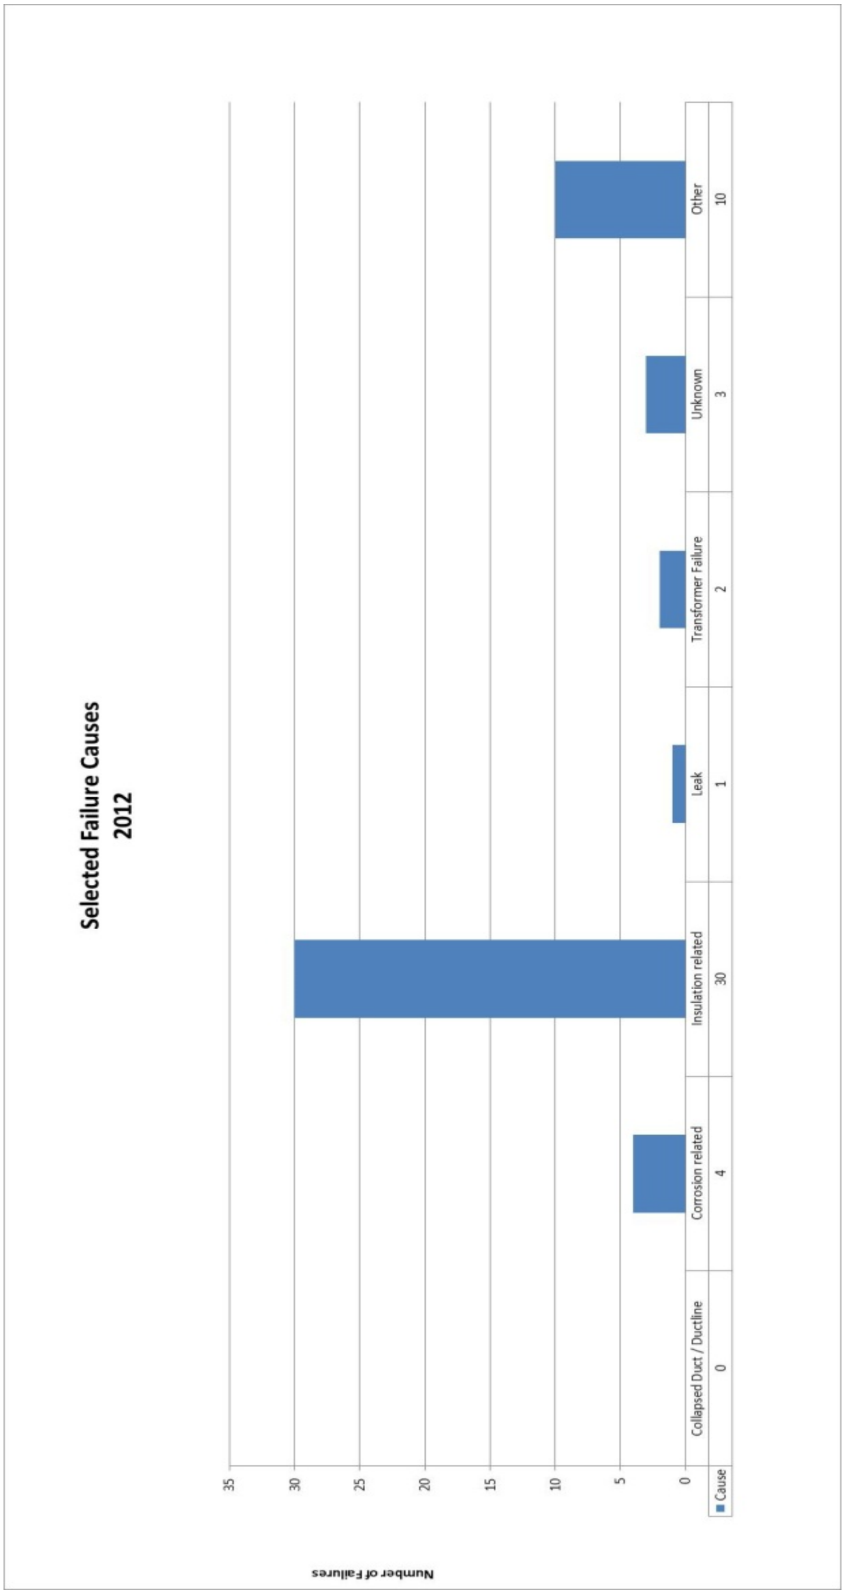

Figure 3.10: Selected Failure Causes (2012)

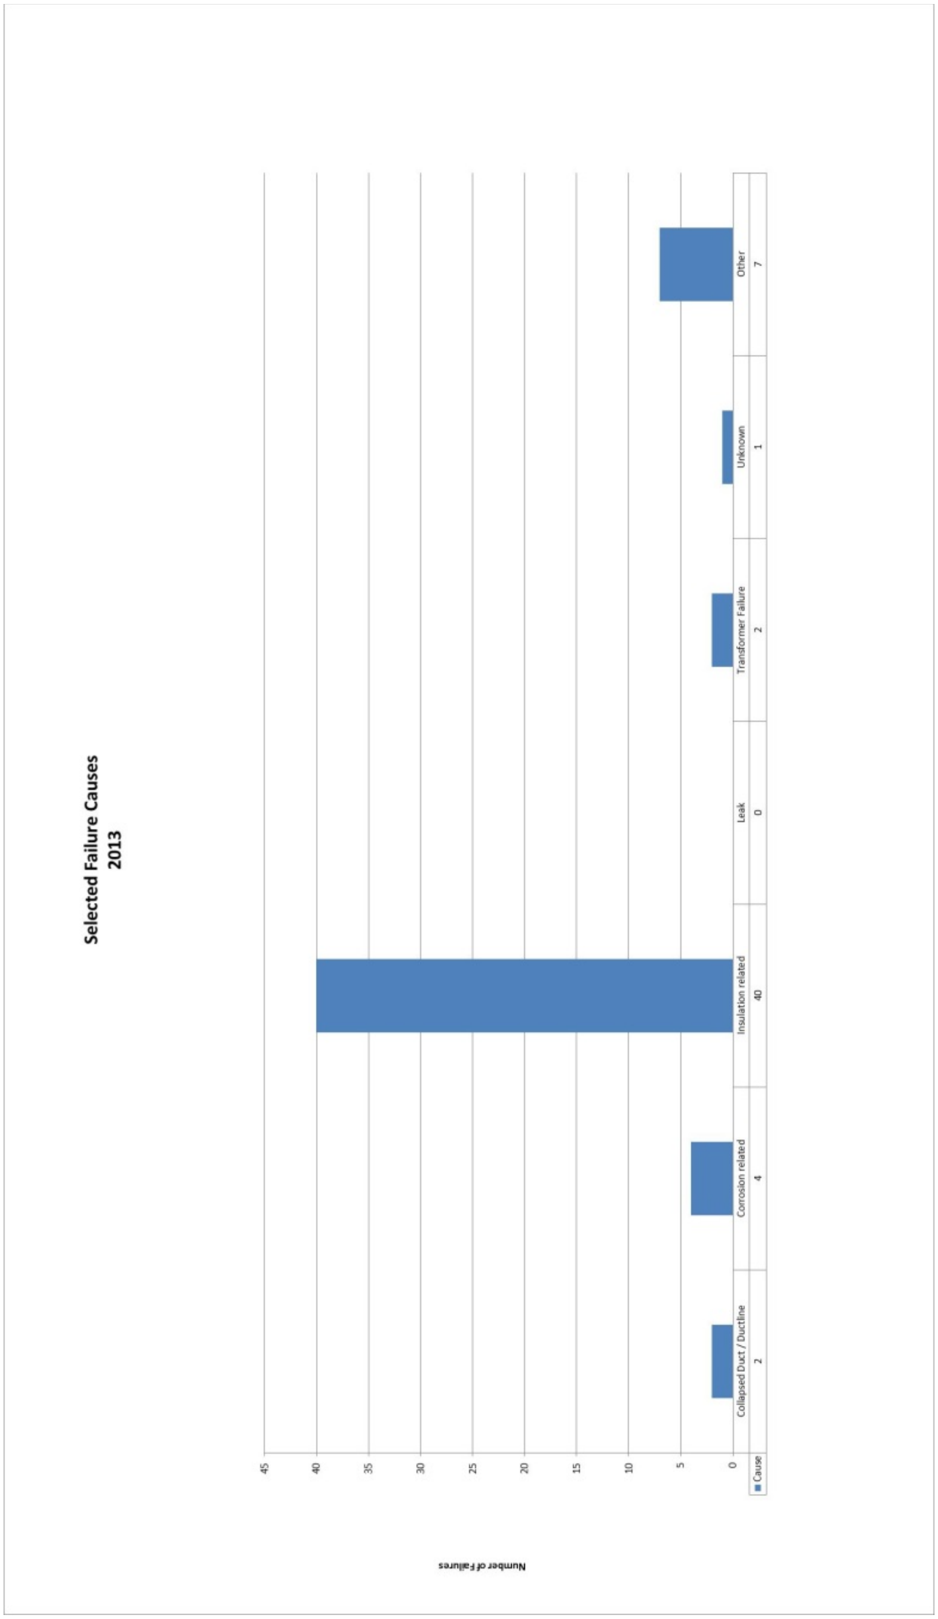

Figure 3.11: Selected Failure Causes (2013)

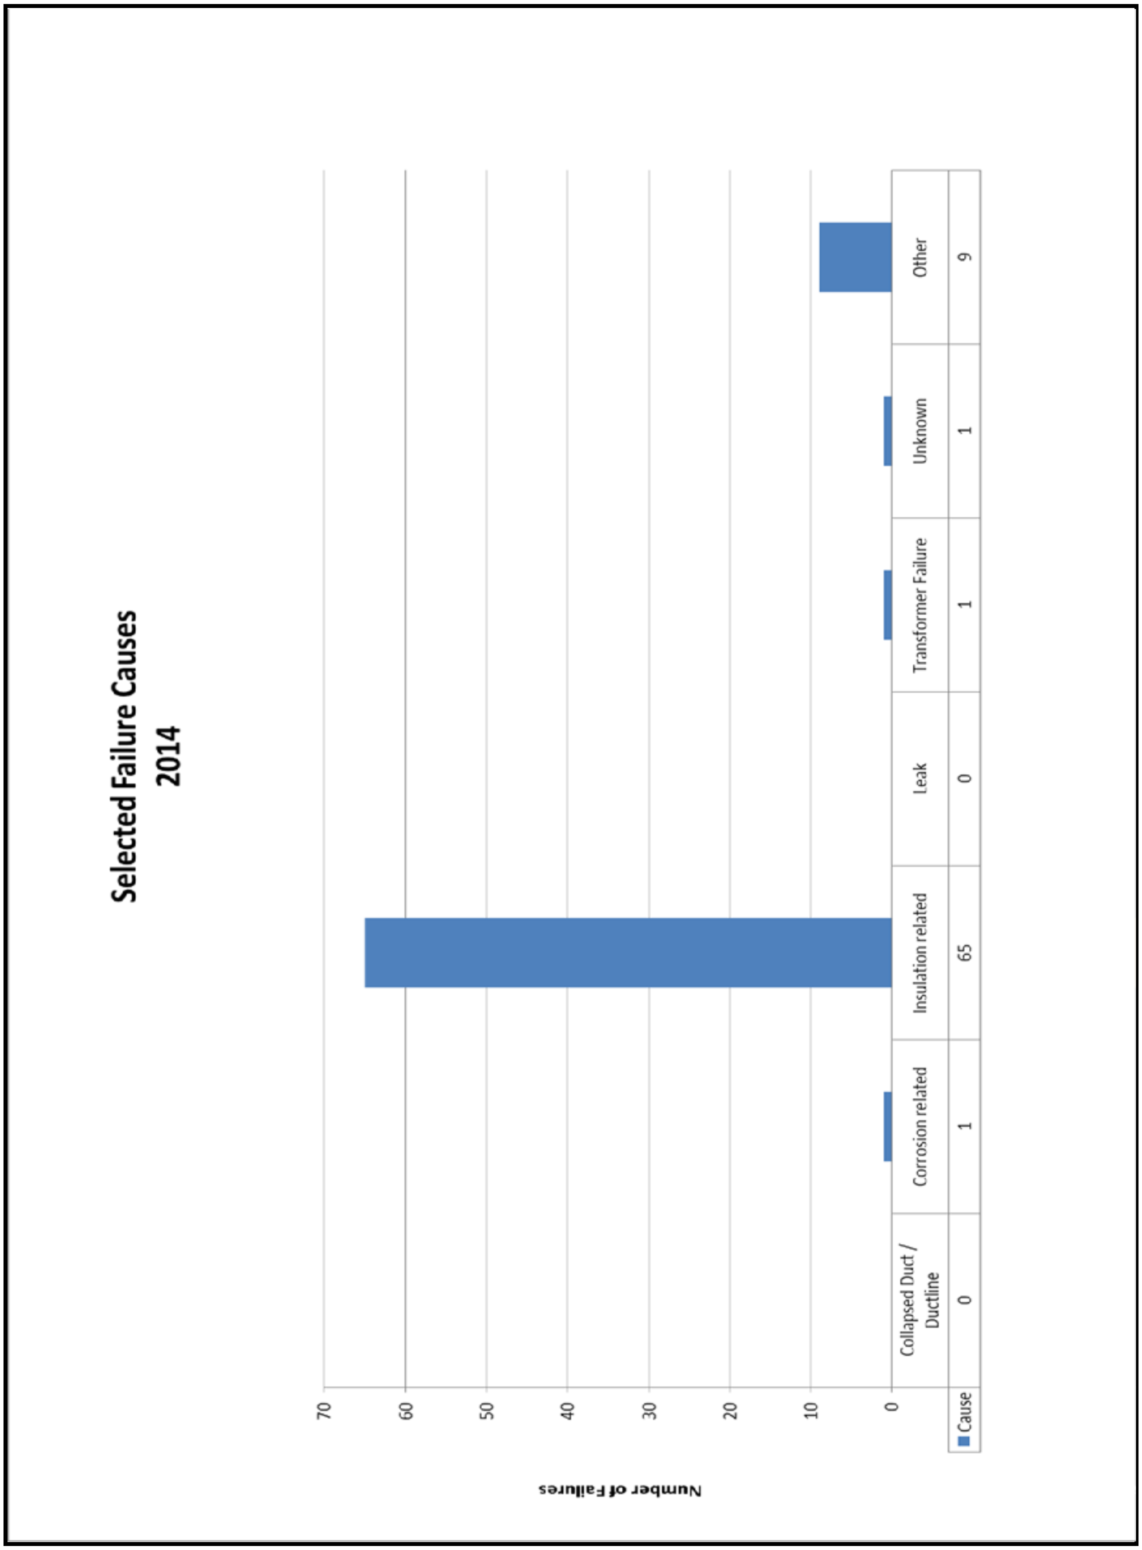

Figure 3.12: Selected Failure Causes (2014)

The type of insulation related to cable and joint failures resulting in a reportable event for secondary equipment does not provide a discernible trend in reportable events caused by Rubber Lead (RL), Rubber Neoprene (RN), or other insulation types (Figure 3.13). RL secondary cable is an outdated technology and has not been installed on the system for more than twenty years. It is not possible to trend future reportable events associated with this cable type.

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
RL	31	10	16	17	18	23	16	7	9	10

Other	0	3	4	7	2	2	3	1	2	4

Figure 3.13: Insulation Type of Secondary REs (2005-2014)

PILC is the predominant primary cable on the Pepco underground system. Consequently, most primary cable reportable events involve PILC cable (Figure 3.14).

	2006	2007	2008	2009	2010	2011	2012	2013	2014
PILC	15	28	22	26	23	24	17	13	22

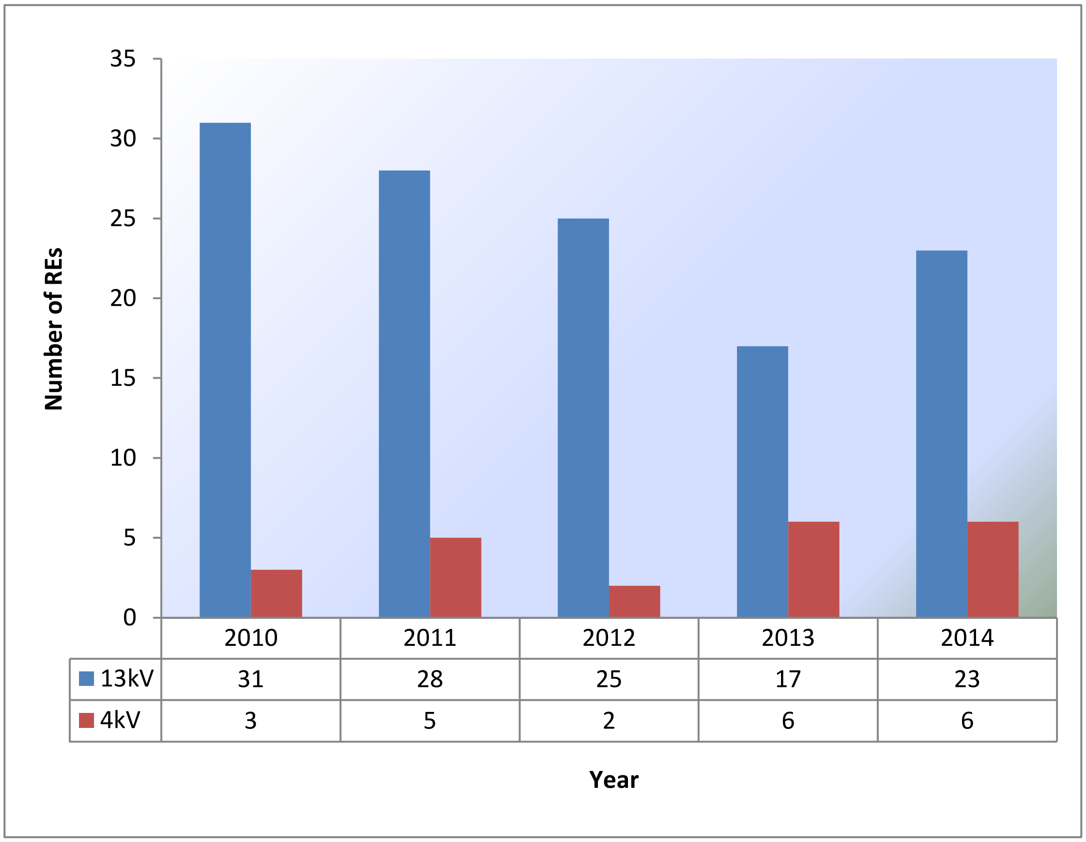
Other	1	0	1	1	3	0	2	1	0

Year

Figure 3.14: Insulation Type of Primary REs (2005-2014)

The majority of reportable events involving primary equipment occur on 13 kV feeders (Figure 3.15). 4 kV is a vintage technology and the majority of Pepco's underground system is 13 kV.



<u>Figure 3.15: Voltage Class of Primary REs (2010-2014)</u>

In addition, moisture plays a major role in the deterioration of both primary and secondary cable insulation. When a significant amount of precipitation is received in the District, moisture and contaminants from the street, such as motor oil, lawn chemicals, etc., enter into the manholes and affect cable insulation. Additionally, snow/ice melt chemicals ingress after a storm can also penetrate cable insulation and lead to failure. While moisture affects all cable insulation, since secondary cable is not as robust or of the same design as primary cable, secondary cable is inherently more likely to fail under adverse weather conditions. A comparison of Figures 3.16 and 3.17 suggests that total moisture accumulation affects the number of reportable events.

Month

Figure 3.17: Total Precipitation in Inches by Month (2010-2014)

The number of reportable events for the month of February decreased from 27 in 2010 to 6, 4, and 2 in 20011, 2012, and 2013, respectively. However, in 2014 the RE was slightly increased to 7. This suggests a correlation can be attributed to the more than 34" of snow received in February 2010 and the below-average snowfall in 2011, 2012 and 2013. In 2014 the total precipitation was almost double the amount in each of 2011, 2012 or 2013. There was a significant increase in the number of reportable events in March of 2014, which is likely attributable to 13.63" of precipitation received during the preceding three month.

Year	Reportable Events (REs)	Total Failures
2008	69	284
2009	82	271
2010	111	275
2011	84	268
2012	50	210
2013	56	196
2014	77	196

Table 3.1: Reportable Events and Underground Failures

The Failure Analysis Section will continue to perform failure analysis for all manhole incidents in the District in order to determine trends and remediation activities.

Underground Failures in the District of Columbia

Reportable manhole events reported for 2014 increased by 38% (56 to 77) as compared with 2013. Reportable events may be considered a subset of underground (UG) equipment failures, and are comprised of equipment failures for which there is a significant visual result (smoke, flames, cover displaced). Among UG equipment failures, the most frequent involve cable. As shown in Table 3-2, in 2014 primary joint and miscellaneous equipment failures decreased by a significant amount compared to 2012 and 2013.

An analysis of underground failures for the months of January through December for the years 2010 through 2014 respectively for the 4 kV and 13 kV primary and secondary systems was conducted. The results are presented in Table 3-2 and Figure 3-18. The failures were grouped into six types – primary cable failures in the manhole, primary cable failures in duct, primary splice failures, secondary single phase and secondary three phase cable and splice failures, and underground equipment failures. Pepco continues to seek ways to improve and minimize reportable events.

Year	Primary							Secondary		Total
	13kV Cable in Manhole	13kV Cable in Duct	13kV Splice	4kV Cable in Manhole	4kV Cable in Duct	4kV Splice	Misc. Equipment	Secondary Single Φ	Secondary Three Φ

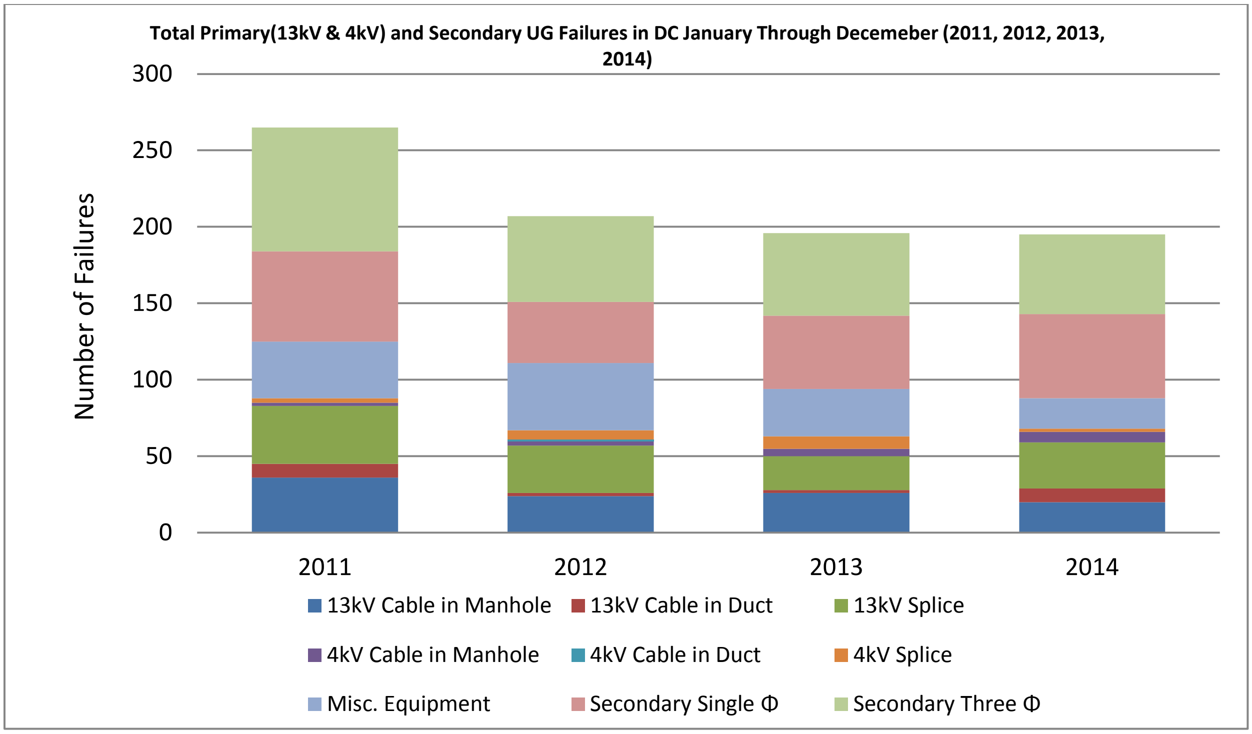

Figure 3.18: UG Failures in the District

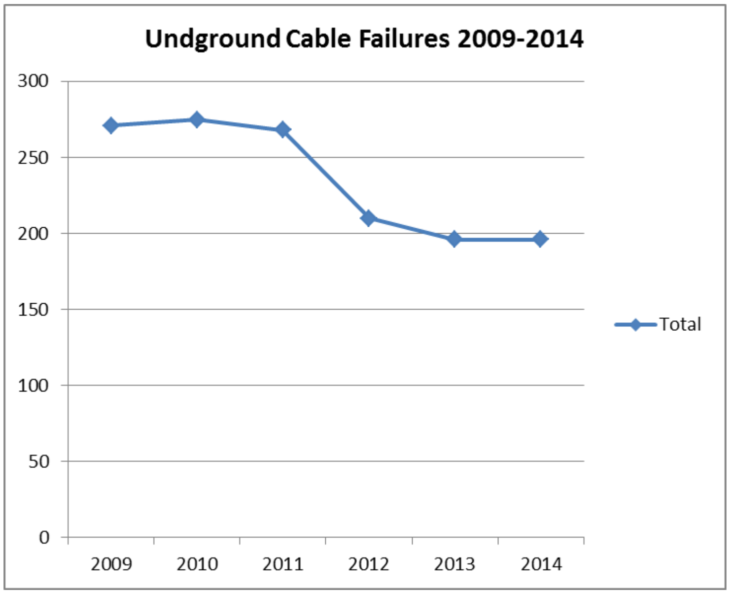
Analysis of Underground Cable Failures in 2014[75]

Underground cable failures are identified according to six different types: primary cable failures in the manhole, primary cable failures in duct, primary splice failures, secondary single phase and secondary three phase cable and splice failures, and underground equipment failures. As reflected in Table 3.2, Figure 3.18, and the following table, Pepco's system has experienced fewer manhole events annually 2009-2013, and the number of 2014 events remained equal to 2013.



Description of AMI Equipment Failures[76]

There are two categories of "AMI Equipment" that make up Pepco's AMI network: the AMI meters themselves, and AMI communication equipment. Pepco is not a communications company, and therefore uses meter manufacturing companies to maintain its AMI equipment. This equipment is covered by contractual relationships to minimize Pepco's risk in the event of defective products.

Pepco AMI meters were purchased from the meter manufacturers General Electric and Landis+Gyr. Pepco AMI meters come with a five year warranty from the date of delivery. All

[75] This section responds to the Commission's direction for Pepco to "include in its 2015 Annual Consolidated Report an analysis of its underground cable failures occurring in the District during 2014." *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 327 (February 27, 2015).

[76] This section responds to the Commission's direction for Pepco to "include in its 2015 Annual Consolidated Report information describing the number of AMI equipment failures occurring in 2013 and 2014, and how any such failures are being addressed." *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 327 (February 27, 2015).

meters removed from the field are evaluated in the Pepco meter shop and suspect meters are returned to the meter manufacturer for warranty repair and/or replacement. Pepco is in the post deployment phase of evaluating and shipping suspect meters back to the meter manufacturers for repair. Pepco has returned or is in the process of returning approximately 3,700 meters to the meter manufacturers for root cause analysis. The overall return rate to the meter manufacturers is approximately 0.44% (less than 1%) of the in-service meter population.

There were less than nine AMI equipment failures in 2014. AMI communication equipment consists of only three equipment types. These equipment types are radios (Access Points and Repeaters) and Battery Backup units. Each installation or assembly consists of one radio and one battery backup unit with associated cables and hardware. The assemblies are replaced as a unit when a failure is suspected. The removed equipment is returned to the manufacturer for repair or replacement as all AMI equipment comes with a five year warranty. AMI communication equipment replacement was considered part of the pilot project in 2013 and was not tracked separately.

Slotted Manhole Covers [77]

New Slotted Manhole Cover Program Locations

In its 2013 Consolidated Report, Pepco discussed its criteria for selecting areas for installation of slotted manhole covers. This included areas with high load growth and potential business development. The list below provides the locations of slotted manhole covers that were installed in 2014.

Slotted Manhole Cover Installations for 2014

Date	Address	Quantity	Ward
11/28/2014	U Street (Shaw)	1	1
8/16/2014	Columbia Heights	1	1
7/21/2014	Petworth	1	1
5/9/2014	Columbia Heights	2	1
5/22/2014	Logan Circle	1	2
8/6/2014	Petworth	1	4
10/9/2014	U Street (Shaw)	1	1
7/2/2014	Shaw	1	6

Figure 3.19: Slotted Manhole Cover Installation Locations[78]

[77] Order No. 16975 states the following at paragraphs 74 and 111:

85. *Decision: …We agree with the Staff that a manhole replacement program that concluded in 2004 may no longer be appropriate, given business development in new areas of the District. We therefore require Pepco to reexamine the criteria used to select locations for the installation of slotted manhole covers and to report on this reexamination in the 2013 Consolidated Report.*

114. *Pepco is DIRECTED to revisit criteria used to select locations for installing slotted manhole covers consistent with paragraph 74 herein;*

[78] This table has been modified to include District of Columbia ward and neighborhood data in response to the Commission's directive to:

> [I]nclude in its 2015 Annual Consolidated Report information on the Table describing current slotted manhole cover installations (shown as Figure 3.19 in the 2014 Annual Consolidated Report) that identifies the Ward and District neighborhood where each newly reported slotted manhole cover was installed.

In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 364 (February 27, 2015).

Historical Slotted Manhole Cover Program[79]

Pepco installed grated manhole covers over single and three-phase transformer installations, and network transformer installations in roadways and sidewalks. Their purpose is to assist in the dissipation of heat from the transformers. To explore the potential of an expanded application of vented manhole covers to non-transformer locations, Pepco contracted the Electric Power Research Institute (EPRI) to simulate manhole explosions. The simulations were specifically designed to test the effectiveness of solid, slotted and grated manhole covers in minimizing displacement of covers under fault conditions. The test data showed that the installation of slotted covers minimizes the frequency and impact of manhole events in three main ways:

- Energy released may escape through the slotted cover without lifting or displacing it;
- Smoke can provide an early warning of cable faults, thus preventing more serious events from occurring; or
- Explosions or fires may be avoided by the dissipation of combustible gases.

Based on these findings, Pepco installed custom-designed, slotted manhole covers in high volume pedestrian traffic areas of the District of Columbia where the low voltage alternating current network exists. The installation of slotted manhole covers has enhanced public safety while minimizing potential damage to underground electric facilities. The installation program was concluded in 2004 with an overall total of 7,880 slotted manhole covers having been installed.

In Order No. 14093, the Commission approved Pepco's proposal to suspend further slotted manhole installations provided the Company submit an analysis of manhole events and failure rates associated with slotted covers, including recommended actions for 2008 by October 27, 2007, and continue to monitor debris accumulation in manholes with slotted covers. Pepco filed its analysis on August 21, 2007. Pepco realizes that the openings in the covers, while allowing gases to vent, also allow rain, snow, dirt, debris and chemicals into manholes. As a result, Pepco continues to monitor debris accumulation in manholes with slotted covers. Of the 77 reportable manhole events that occurred in the District of Columbia in 2014, 27 involved

[79] In Order No. 16091 issued on December 10, 2010, the Commission stated among other things, at paragraph 59, the following:

59. …(4) include trend analyses for "Use of Slotted Manhole Covers;"

manholes fitted with slotted covers.[80] Twenty of these involved smoke being detected coming from the manhole slots, allowing them to be quickly identified and remedied, and seven involved explosions. Over the five-year period from 2010 through 2014, there were 378 reportable manhole events. Of these, 98 (26%) occurred in manholes with slotted covers. See Figure 3.20.

	2010	2011	2012	2013	2014
All Events	111	84	50	56	77
Slotted	31	24	6	10	27
% Slotted	28%	29%	12%	18%	35%

Figure 3.20: Manhole Events Involving Slotted Covers

[80] One additional event did not involve Pepco facilities.

Cable Splice or Joint Records[81]

Quality of workmanship is also being monitored as part of Pepco's program to reduce underground failures. Pepco repair crews complete a "Splice Manifest" report which records, among other things, the location, date, type of splice, the splicer's name and the foreman's name. Table 3.3 contains information from the "Splice Manifest" report for 2014 maintenance work performed. The splicer and foreman names have been redacted from the table.

[81] In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:
59. *…(5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable.*

Table 3.3 (continued): 2014 Splice Data (District of Columbia)

Appendix 3A: 2014 Manhole Events[82] [83]

82 In Order No. 11716 ordering paragraph 3, the Commission ordered the following:

3. PEPCO shall file an annual report on the previous calendar year's manhole incidents;

83 Order No. 16975 states the following at paragraphs 72 and 110:

72. Decision: We accept the Staff's recommendation and require Pepco to include grid numbers and Siemens' inspection dates on manhole event reports. Each year over 200 manholes are selected through stratified sampling criteria and inspected by Siemens. Including grid numbers and inspection dates will help to identify manhole events traced to the manholes recently inspected, manholes located along Pepco's Priority Feeders, and manholes with and adjacent to recent manhole events. This will enhance independent/third party validation and quality assurance of the manhole inspection program.

110. Pepco is DIRECTED to provide grid numbers consistent with paragraph 72 herein;

As required by Order 16975, the grid numbers and Siemens' inspection dates have been included in the Manhole Event data reported below.

New Manhole Event Information

At the December 13, 2011 and February 16, 2012 PIWG meetings, it was decided that the following types of additional information related to manhole events would be included in future Consolidated Reports. The following categories of information have been included in this year's Consolidated Report.

- Incident Date
- Work Order/Request #
- Address
- Grid Number
- Feeder Number
- Manhole cover type (solid, slotted, roadway, round, sidewalk)
- Manhole Condition (clean, water below cable, water above cable, debris above cable)
- Voltage class (600V, 4kV, 13kV, 34kV, 69kV)
- Type of equipment (transformer, protector, cable, switch, straight joint, branch joint, trifurcating joint, transition joint, other)
- Equipment description: details specifics of the equipment such as size, insulation, phases, type of joint
- Repair description: details repair work
- A description of the failure mode (not previously recorded)
- A determination if the failure is a repeating event at this location (not previously recorded)

Pepco undertook a substantial database conversion during 2012 to make these additions to enhance summary reporting and analysis. The duration of the repair effort, which was outstanding in the database conversion effort as of the 2013 Consolidated Report, is now included within the database.

The listing of 2014 Manhole Events is provided in the following table.

2014 MANHOLE EVENT REPORT - DISTRICT OF COLUMBIA

Appendix 3B: 2014 Manhole Inspection Program[84]

[84] In Order No. 11716, the Commission stated the following:

PEPCO is hereby directed to include the following information in its [manhole inspection] reports beginning in July 2000:

1. *The general location of the manholes inspected, including the street or streets where the manholes are located and the blocks bounding the street, e.g., M Street, NW, between 23rd and 28th streets;*
2. *The number of manholes inspected in the month, broken down as to the number of manholes containing primary cables only, both primary and secondary cables, and secondary cables only;*
3. *The number of primary cable problems found;*
4. *The number of secondary cable problems found;*
5. *The type of cable problems found in each manhole, categorized as to the physical degradation or damage of the cable, overheating, overloading, damaged splice and deteriorated cable or splice due to age;*
6. *The number of manholes with problems;*
7. *The corrective actions taken for each cable and manhole problem found; and*
8. *Other general condition of the manhole such as whether it contained water, oil, grease, debris, and whether the manhole cover and the manhole are in good mechanical condition.*

APPENDIX 3B - MANHOLE INSPECTION PROGRAM (MIP)

Pepco began development of its manhole inspection program in 1999. By the end of 2006, Pepco had performed a total of approximately 79,295 inspections, completing Phase I. Phase II of the Company's Manhole Inspection Program began in 2007 and was completed in the first quarter of 2013 with a total of approximately 69,670 inspections. Phase III of the manhole inspection program is currently underway. 11,554 manholes were inspected in 2013, approximately 9,054 of which constitute Phase III inspections. In 2014, 11,533 manholes were inspected as part of the Phase III.

In contrast to the reported inspection totals in previous reports, Pepco now reports a Phase II inspection total of 69,670 manholes. A recent investigation of unique manhole inspections undertaken by the Public Service Commission's technical audit revealed that the querying method Pepco historically used to identify unique inspections in the tracking database contained an error. Pepco historically used an estimated population of approximately 60,000 manholes in the District of Columbia in reporting, although the number of manholes containing distribution facilities, and therefore included in the manhole inspection program, is slightly lower. For technical reasons, transmission manholes are inspected through a different program. However, the Company believes the total number of manholes in the District was presented as the population to be inspected as part of the manhole inspection program. Since duplicate inspections are inherent in the design of the program, the possibility of this error was not evident. The Company has since corrected the database querying issue.

Manhole inspections represent a significant undertaking that involve the visual assessment of the underground manholes and vaults and the equipment contained in them, taking load readings of low voltage cables and reviewing the integrity of cable splices. Supervisory personnel review records and corrective actions are identified and tracked. Data obtained during the inspections can be used to ascertain whether the secondary cables are overloaded, or are likely to be overloaded under peak load conditions using appropriate de-rating factors and factors to simulate peak conditions. Inspections are also designed to identify load variations between phases which could indicate possible imbalanced conditions. By identifying such instances and taking appropriate actions, Pepco hopes to further improve the reliability of its system.

Pepco's Manhole Inspection Program (MIP) inspection priority scheme consists of four remediation time frames ranging from immediately to within five days, to 18 months as shown below. The four-priority remediation scheme, in place since October 2001, was renumbered at the beginning of 2004 from 0-3 to 1-4 to coincide with other Company maintenance activities.

Inspection Priority Definitions

- **Priority 1 (Urgent):** Corrective action required immediately, or within 5 days: Perform repairs immediately or within 5 days where the identified deficiencies have caused outages, or present imminent risk of causing outages, or serious safety or environmental risk.
  - Cable smoking
  - Joint smoking
  - Insulation damage – Bare Conductor
  - Burnout visible
  - Loading greater than 140% of rating
  - Heating greater than 200° F
  - Elevated Gas Readings Reported to Gas Company

- **Priority 2:** Corrective action required within 6 months of inspection
  - Insulation damage
  - Loading between 120% and 140% of rating
  - Heating between 175° F and 200° F
  - Open limiters

  Assess cable leak, joint swelling, joint leaking, deformed joint, and neutral corroded condition information to determine Priority 2 or 3.

- **Priority 3:** Corrective action required within 12 months of inspection
  - Braided cable
  - Loading between 100% and 120% of rating
  - Heating between 150° F and 175° F

  Assess upright support condition information to determine Priority 3 or 4.

- **Priority 4:** Corrective action required within 18 months of inspection
  - Re-racking primary cables and secondary cables
  - Cables not secured
  - Structural repairs
  - Retag feeders and buses

- **Non-Reportable Referrals:**
  - Water
  - Debris
  - Cracked wall
  - Other

Current Program Status

During 2014, the MIP has identified the following remediation Priorities:

	Priorities Count	Percentage of CY 2014 Priorities
Priority Code 1	215	11.8%
Priority Code 2	146	8%
Priority Code 3	53	2.9%
Priority Code 4	1406	77.2%

Inspectors are conducting more comprehensive and thorough inspections which have resulted in a substantial increase in Priorities found. In 2014, approximately 15% of the manholes inspected revealed potential areas of concern that have been, or are in the process of being addressed. Figure 3.2-B1 provides a graphical representation of the number of manholes and the percentage of overall inspections with priority conditions during Phase III.

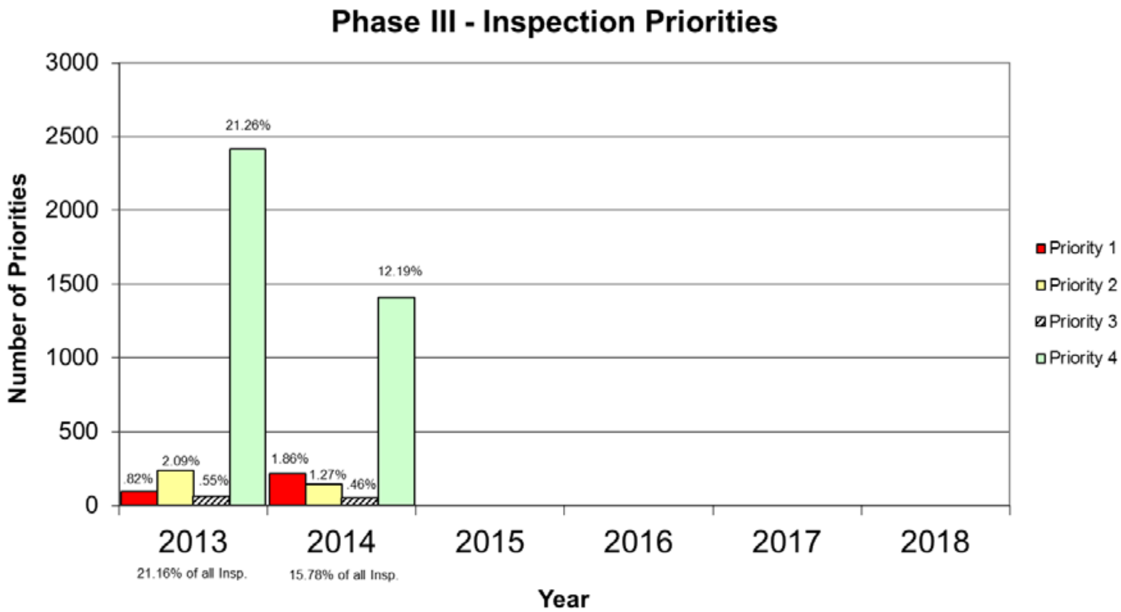

Figure 3.2-B1: Manhole Inspection Priorities – Phase III

With the implementation of the Manhole Inspection Quality Control (QC) Program, inspection Priorities have increased from 155 in 2006 to 1,301 in 2007 to 2,719 in 2008 to 2,450 in 2009, 1,515 in 2010, 1,271 in 2011, 2,856 in 2012 and 2809 in 2013. In 2014, there were 1,820 Priorities. The decrease in 2014 compared to 2013 prior was primarily due to the decrease in Priority 4 conditions detected. Priority 4 conditions which include re-racking cables, securing cables, needing structural repairs and retagging feeders and buses, account for over 82% (3,822 of 4,629) of all Priority conditions found during Phase III. A Priority 4 condition which is required to be remediated with 18 months of the inspection is not considered an imminent risk but has been recommended for remediation by the Commission Staff's consultant (Siemens) in FC No. 991.

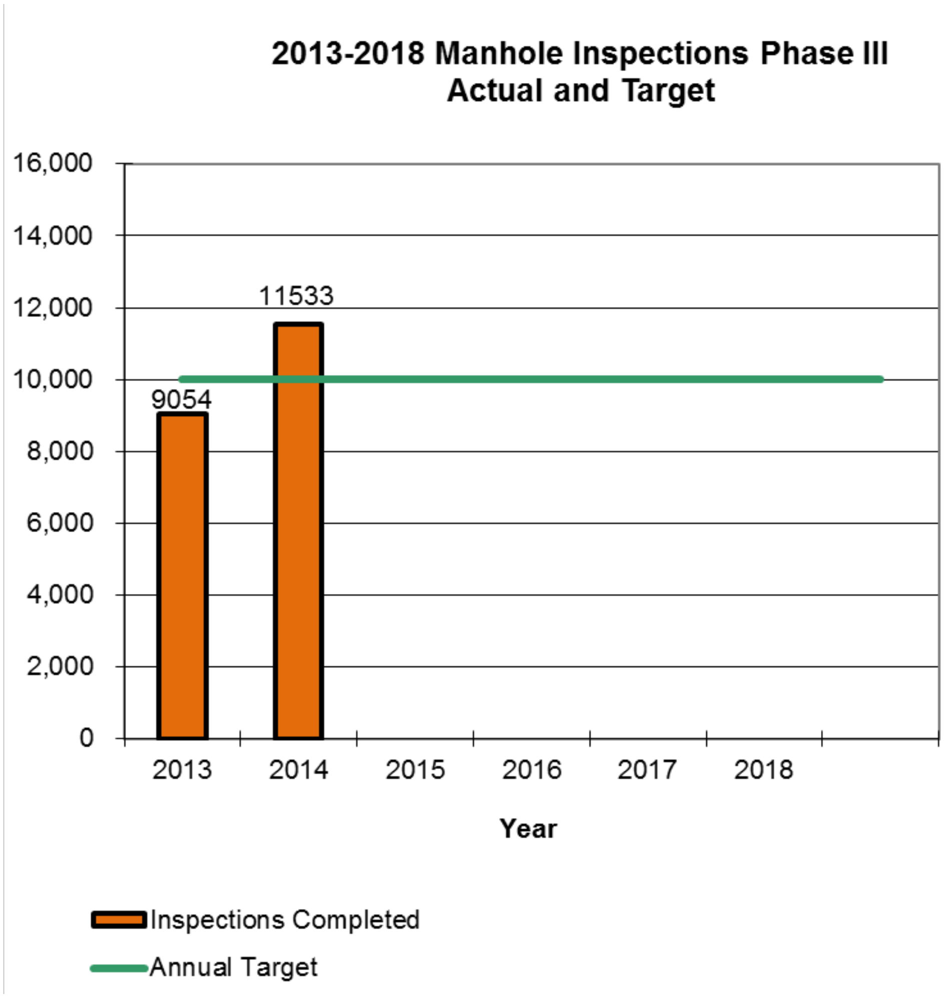

Figure 3.2-B2-A: Manhole Inspections Completed – Phase III

Inspection Plan - Phase III

Implementation of Phase III includes:

- Manholes will be inspected using Pepco's underground department's geographical-based work plan, which designates that all manholes within a specific sub-boundary of the city be inspected during specified timeframes.
- 2013 Inspections: Central Business District's Western Quadrant, 2013 Priority Feeders, Adams Morgan and Shaw Community. Total Phase III inspections planned for 2013; 10,000. 9,054 Phase III inspections completed. Including Phase II inspections, 11,554 inspections were completed in 2013.

- 2014 Inspections: Farragut Square area, North Center Quadrant of Business District, 2014 Priority Feeders, and sections of the Mt. Pleasant area and other dense population areas. Total inspections planned for 2014: 10,000. Total inspections completed in 2014: 11,533.
- Planned 2015 Inspections: Mt. Pleasant area, 2015 Priority Feeders, Columbia Heights area, areas within the Central Business District and other dense population areas. Total inspections planned for 2015: 10,000.
- Planned 2016 Inspections: Vicinity of Substation 2 Tenth and Eleventh Streets, O and P Streets, NW, Feeders 15204 and 15206; (2) 2016 Priority Feeders; (3) Central Business District; and (4) Vicinity of Architect of the Capitol Service Area Substations 18 and 161 SE/NE.
- Planned 2017 Inspections: (1) Georgetown (2) 2011 priority Feeders (3) Vicinity of H Street NE corridor and 14th St, NW corridor (4) Southern 12th St, NW corridor.
- Planned 2018 Inspections: (1) Ward 7, East of Anacostia River between Eastern Ave and Southern Ave, North East to South East; (2) Ward 3, Mass Ave & Western Ave East to Nebraska Ave, North East to Fessenden St.; (3) Ward 4, 14th & Peabody East along Missouri Ave to Eastern Ave.
- Manhole inspections will be performed in the same manner as in Phase I with the exclusion of inventorying the duct banks, as the initial duct bank inventory occurred during Phase I of the Program. Validation of recorded inventory will continue to occur. Thus, the time savings associated with not having to re-inventory the duct bank is estimated to be minimal and does not translate readily into dollar savings as the time saved does not allow for another inspection to be performed.
- A monthly count of manhole inspections will be generated via an appropriate electronic database.

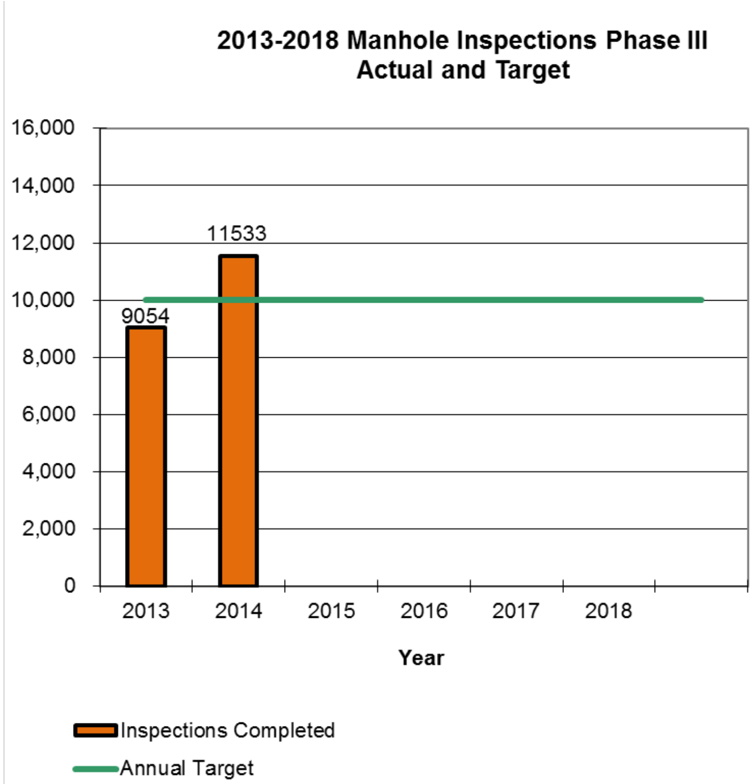

Figure 3.2-B2-B: Manhole Inspections Completed – Phase III

Quality Control Program

The Commission's technical consultant, Siemens, conducted 215 manhole inspections between July and September 2007. The results of Siemens' inspections as compared to Pepco's inspections raised concerns regarding the quality assurance and reliability of Pepco's inspection program. As a result of Siemens' findings, the Company initiated a Quality Control (QC) Program. Effective August 27, 2007, Pepco instituted a QC Program for its Manhole Inspection Program to minimize internal data inconsistencies. The QC Program uses a statistically valid sampling plan based upon Military Standard 105E. Since on average Pepco inspects 2,500 manholes per quarter, the lot size parameter used is "1201 to 3200" with an Acceptable Quality Level ("AQL")[85] equal to 2.5%.

[85] It is common to use an AQL of 1% for major defects, and 2.5% for minor defects. Values of AQL that are 10% or less are suitable for percent nonconforming or nonconformities per 100 items. Values of AQL over 10% are only suitable for nonconformities per 100 items. Source: www.sqconline.com

Utilizing the "Double" sampling procedure, Pepco will re-inspect 80 manholes per quarter. If the number of non-conforming items is three (3) or less, the lot is accepted. However, if the number of non-conforming items is seven (7) or more, the entire lot will be rejected and all manholes for the quarter will be reinspected.

If the number of non-conforming items is between four (4) and six (6) inclusive, 80 additional manholes will be reinspected. If the total number of non-conforming items (sum of nonconforming items in both samples) is eight (8) or less, the lot is accepted. However, if the total number of non-conforming items is nine (9) or more, the entire lot will be rejected and all manholes for the quarter will be reinspected. See Figure 3.2B-3.

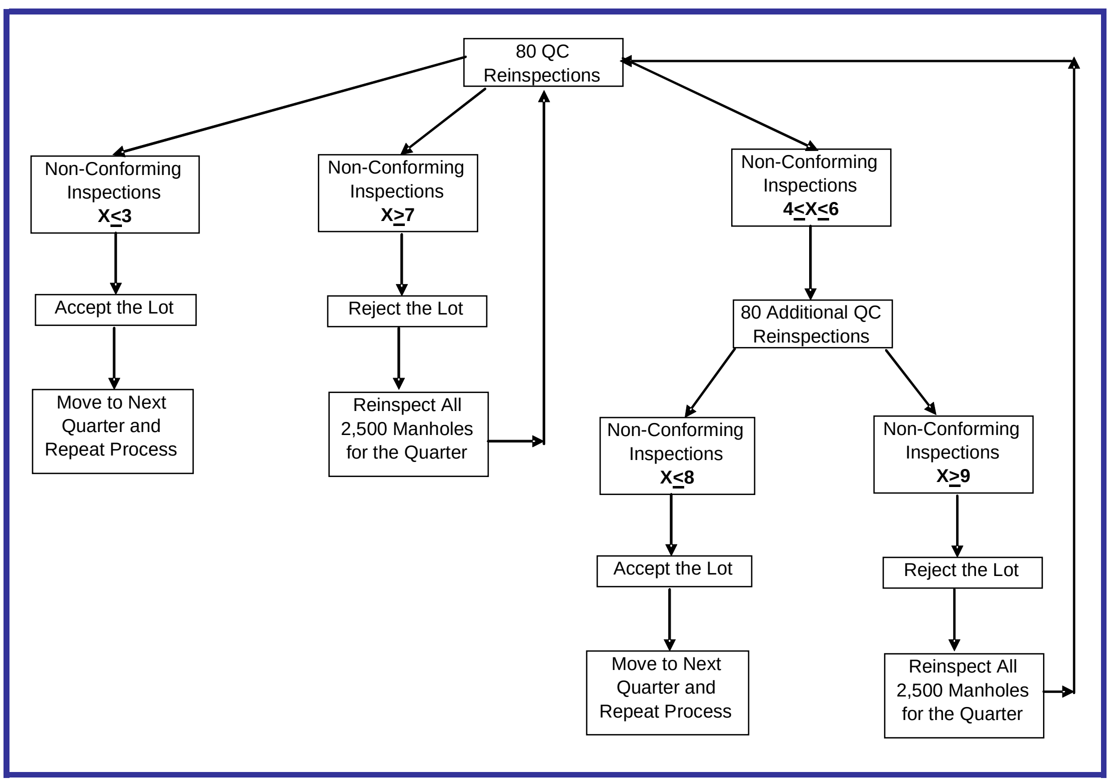

Figure 3.2-B3: QC Program Process Diagram

The QC Program became effective beginning with the third quarter 2007 manhole inspection results. Based on statistical sampling, Military Standard 105E with an Acceptable Quality Level

("AQL") equal to 2.5%, Pepco's quarterly QC inspections have been accepted since the third quarter of 2007. Specifics for the 2014 QC Program results are as follows:

2014 QC Program Results

	Result
1st Qtr. 2014	Accepted: No Failures
2nd Qtr. 2014	Accepted: (1) Cover Type
3rd Qtr. 2014	Accepted: No Failures
4th Qtr. 2014	Accepted: (1) Cover Type

The following criteria must be satisfied in order for the manhole inspection to be considered acceptable.

- The reportable conditions recorded must be consistent with those found during re-inspection. If a reportable condition has been remedied prior to the re-inspection, the QC inspection will consist of verifying the repair.

- The inspection record must contain (1) grid number location and (2) cover type. Both of these fields must be accurate.

Other items that should be accurate and included on the inspection form but are not grounds for rejecting the inspection include the (1) inspector's name, (2) date of inspection, (3) gas percentage reading, (4) cover size, (5) manhole size and (6) manhole type. If one of these items is either inaccurate or missing from the inspection form, the inspector responsible will be notified and discussions on performance improvements will be conducted.

Although Pepco is pleased with the 2014 results, the Company is fully aware that the success of the QC Program can only be measured over sustained periods of time. As such, Pepco is committed to the QC Program to ensure the accuracy, reliability and thoroughness of its manhole inspection program.

The results of the QC Program are presented quarterly during the PIWG meetings along with quarterly manhole inspection data.

Appendix 3C: Network Accuracy Procedure Report[86]

[86] In Order No. 16709 paragraphs 9 and 10, the Commission ordered the following:

9. *The Commission is satisfied that Pepco has developed a reasonable plan to ensure that its underground cables are adequately sized for existing and future loads. However, we do want to monitor Pepco's diligence in performance and the results of implementation of its network modeling, GIS updates, and timely network technology improvements going forward. We, therefore, direct the Company to file periodic reports to keep the Commission and interested parties apprised of the status of several ongoing projects as follows:*
   a. *Pepco is directed to provide a detailed status report on those eight networks that are currently undergoing analysis under the Company's Network Accuracy Procedure including the corrective actions that were identified by December 2011. This report on the eight networks should be added to the Company's 2012 Consolidated Report or filed as a Supplement to the 2012 Consolidated Report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report; and*
   b. *Pepco is directed to file a detailed status report on the results of its modeling and analysis and the implementation of its remedial actions on all of its remaining networks under its Network Accuracy Procedure. This report on the remaining networks should also be added to the 2012 Consolidated Report (or filed as a Supplement to the 2012 report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report) with updates in each subsequent year's report. The status report on those remaining networks shall include corrective actions that have been scheduled and those that have been completed.*

   THEREFORE, IT IS ORDERED THAT:

10. *Pepco shall comply with the directives set forth in paragraph 9 herein.*

Network Accuracy Procedure Report

Order No. 16975 Requirement

Order No. 16975 states the following at paragraphs 56 and 104:

56. ***Decision:*** *In Order No. 16709, the Commission required Pepco to file reports on the status of projects designed to assure that network groups are adequately sized for existing and future loads. The Staff found insufficiencies in the report filed by Pepco on May 11, 2012 and sought additional information and clarification about the models used in the Network Accuracy Procedure. Pepco answered Staff's questions in its August 9, 2012 Response. The Commission accepts the information provided by Pepco as responsive to the questions posed by the Staff. With regard to the additional information requested by OPC, we direct Pepco to provide the following in its 2013 Consolidated Report:*

a. A description of how Automatic Metering Infrastructure data will be used in the Easy Power model;

b. If AMI data is not used in the Easy Power model, an explanation as to why this data is not used;

c. A description of how voltage readings from AMI meters may or may not be used to validate the results of the Easy Power model;

d. A description of how data from network monitors may or may not be used to validate the results of the easy power model; and

e. A report on efforts to validate secondary cable sizes for the network models.

104. Pepco is ***DIRECTED*** *to provide information on its Easypower model and AMI consistent with paragraph 56 herein;*

Pepco Response

Below are Pepco's responses.

a. Starting in Fall 2014 AMI data is used in the Company's Easypower network studies. AMI loads along with previously existing interval meter loads are downloaded, aggregated to the appropriate bus hole locations that serve each customer and imported into the Easypower model. Since most all load data available is interval demand data, the need to convert monthly energy usage into hourly demand is mostly eliminated. Profiled demand based on energy usage data is used in the small number of instances where AMI data is not available for particular customers for the analyzed historical time period. Having interval demand data for most all customers improves the accuracy of the EasyPower model as Pepco has seen smaller discrepancies between summed customer load data and measured loads for many networks analyzed As of 2015, Pepco is converting its process to allow AMI data to be aggregated to bus holes and imported into EasyPower.

b. AMI data is being used.

c. Voltage readings from AMI will be used to validate base case voltages that arise from power flow analysis. AMI metering voltage reading data will also assist Pepco in its investigations of voltage irregularities that are found through power flow analysis or reported by a Pepco customer. Pepco is currently developing a process to download and store voltage information from AMI meters.

d. The Network RMS has the ability to capture transformer loads and voltages, which can be used to validate the same parameters derived in the power flow analysis. Available RMS data has been examined to confirm that the Easypower model is accurate.

e. As part of Pepco's design criteria for adding new load above 25 kW to the LVAC secondary grid, secondary cable sizes in the vicinity of the proposed new load are inspected in the field to confirm the secondary cable sizes and number as indicated in the EasyPower model. In addition, Pepco will be using manhole inspection data to supplement field inspection.

Order No. 16709 Requirement

Commission Order No. 16709 states the following at paragraphs 9 and 10:

9. *The Commission is satisfied that Pepco has developed a reasonable plan to ensure that its underground cables are adequately sized for existing and future loads. However, we do want to monitor Pepco's diligence in performance and the results of improvements going forward. We, therefore, direct the Company to file periodic reports to keep the Commission and interested parties apprised of the status of several ongoing projects as follows:*

   (a) Pepco is directed to provide a detailed status report on those eight networks that are currently undergoing analysis under the Company's Network Accuracy Procedure including the corrective actions that were to be identified by December 2011. This report on the eight networks should be added to the Company's 2012 Consolidated Report or filed as a Supplement to the 2012 Consolidated Report if the 2012 Report has already been filed or if it is too late to include it for publication in the 2012 Report; and

   (b) Pepco is directed to file a detailed status report on the results of its modeling and analysis and the implementation of its remedial actions on all of its remaining networks under its Network Accuracy Procedure. This report on the remaining networks should also be added to the 2012 Consolidated Report (or filed as a Supplement to the 2012 Consolidated Report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report) with updates in each subsequent year's report. The status report on those remaining networks shall include corrective actions that have been scheduled and those that have been completed.

10. *Pepco shall comply with the directives set forth in paragraph 9 herein.*

Pepco Network Accuracy Procedure Implementation Status Report

Commission Order No. 16709 directed Pepco to report on the implementation status of the Network Accuracy Procedure, which was developed in response to the May 31, 2011 Benning Northwest Network outage.

This update addresses application of the Network Accuracy Procedure to the 24 highest-loaded networks in the District of Columbia. It reports the results of the modeling and analysis and the implementation status of the resulting corrective actions. This update also addresses the implementation status of the Network Accuracy Procedure for Pepco's remaining networks.

I. Detailed Status Report on the Analysis of the Highest-Loaded Networks, in Accordance with the Network Accuracy Procedure.

The Network Accuracy Procedure calls for Pepco engineers to complete the fourteen steps described below:[87]

1. Conduct an evaluation of field work orders undertaken in the last two years to ensure that they were accurately modeled, since the last update was conducted two years ago.
2. Create GIS/GWD prints – Highlight in and mark any discrepancies found. Verify feeder designation and cable size.
3. Create legacy Microstation prints for each of the feeders in a particular network. Mark any cable size discrepancies found during the review of the legacy documents on the printed GIS feeder map and the spreadsheet form.
4. Easypower model – Compare GIS with Easypower and note if there are any discrepancies on existing networks, feeder designation, and size of cable on the GIS feeder map and spreadsheet.
5. For points on the feeder where Easypower model shows a larger cable size than GIS and at the critical points along the feeder where a lateral is tapped that serves multiple transformers, obtain the latest manhole inspection report from eFinity, Maximo, or hard copy. Document the cable size in each direction out of the manhole. If review of manhole data verifies cable size, update Easypower and GIS records. If cable size cannot be verified, a field inspection may be necessary.
6. Highlight any transformer discrepancies and send to the respective area Engineering Supervisor to determine required transformer size and verify actual transformer size.
7. For missing cable sizes – review Microstation feeder maps, document information on worksheet to update GIS; verify with field inspection where appropriate when actual cable size cannot be determined from office records.
8. Use Easypower records to update GIS when Easypower shows smaller size cables.
9. Before sending any discrepancies to the field crews Engineering will develop a documented plan for manhole verification to be performed.
10. Pepco Engineering or manhole inspection crews to perform field investigation at critical junctions and manholes designated through office record inspection process.

[87] The Network Accuracy Procedure was filed as Attachment 1 to the Company's Final Report: Analysis of Benning Northwest Network Shutdown, filed in Formal Case No. 1062 on August 29, 2011.

11. Findings from field investigation and office record investigation provided to the GIS and Drafting Services Group for GIS system update.
12. Engineering to perform network modeling (i.e., re-run Easypower Model) upon any new information captured to evaluate the impact of the changes on network system performance.
13. Perform all necessary corrective action within the timeframe for making corrective actions. Determine if the design team and construction team need to be involved to make the corrections.
14. Complete report by documenting all key steps with necessary back-ups for each particular network investigated and corrective action taken.

In accordance with this procedure, Pepco's highest-loaded networks were analyzed as outlined below.

Eight Highest-Loaded Networks

The analysis work associated with the Network Accuracy Procedure for the eight highest-loaded networks was reported in Pepco's May 11, 2012 filing in response to Order No. 16709.

Eight Second-Highest Loaded Networks

The analysis work associated with the Network Accuracy Procedure for the eight second-highest-loaded networks was reported in Pepco's May 2013 filing in response to Order No. 16709.

Eight Third-Highest-Loaded Networks

The analysis work associated with the Network Accuracy Procedure for the eight third-highest-loaded networks was reported in Pepco's February 2014 filing in response to Order No. 16709.

Eight Fourth-Highest-Loaded Networks

The analysis work associated with the Network Accuracy Procedure for the eight fourth-highest loaded networks followed the same pattern as the analysis work for the 24 highest-loaded networks. In 2014, for the eight fourth-highest loaded networks, Pepco Engineering evaluated the field work orders completed over the last two years and updated GIS/GWD and/or the Easypower model as needed. For each network group, an engineer compared the legacy Microstation feeder map and the current GIS/GWD feeder map and noted any discrepancies on the GIS/GWD feeder map. Where discrepancies were found, the manhole inspection data was checked as another source of verification.

At the same time as office records were being checked, engineers identified key manholes at critical junctions for field investigations. These critical junctions were generally at manholes where the feeder branched off to supply a lateral. Field investigations of these manholes were coordinated and completed by designers and field crews. Any discrepancies found in the office records that were not confirmed through the critical manhole inspections were also investigated through field inspections. All office records (GIS and EasyPower model) were updated with field data as necessary. In cases where the EasyPower model was updated with a smaller conductor size than previously existed in the model, a power flow analysis was performed and the results were analyzed to determine if the smaller conductor size created a potential overload condition in the model. Since no potential overload conditions were identified, no work orders needed to be generated for corrective actions.

Continuing with the lessons learned from the Benning Network failure, the Company's network design standards were revised so that engineers are to heavy-up stretches of smaller-sized cable that are positioned between stretches of larger-sized cable on either end when encountered in the course of performing design work. Pepco management added the directive that responsible engineers are to look for instances of smaller-sized cable positioned between stretches of larger-sized cables in the course of conducting office record investigations as part of the Network Accuracy Procedure implementation. Since no such instances were found, no work orders needed to be issued to heavy-up the smaller cable.

<u>Corrective Action Status</u>

Eight Fourth-Highest-Load Network Groups

As mentioned above, no corrective actions were identified or issued for the eight fourth-highest loaded networks, as no overloads were found in the EasyPower analysis; none were required to heavy-up cables to comply with the new design standard either. The following tables detail that no designs were needed after construction field verification; only GIS and EasyPower changes were needed. Once changes were made in EasyPower, no overloads were identified.

Table 3C-8 (cont'd)

II. Status Report of the Analysis of the Remaining District of Columbia Networks, in Accordance with the Network Accuracy Procedure.

Pepco has begun the verification process on the next eight highest-loaded networks using office records (Microstation feeder maps, GIS/GWD, and Easypower model) in accordance with the Network Accuracy Procedure. The office record inspections for the next eight highest-loaded networks and updates to GIS/GWD and EasyPower model are to be completed by June 1, 2015. The necessary field inspections will be completed and corrective actions will be identified by November 1, 2015. The time frame for completing the corrective actions for the next eight highest-loaded feeders will be determined once the corrective actions are identified.

The next eight network groups selected for investigation are:

1. Harvard Sub, 13 Spot Network
2. L Street Sub. 21 South Network
3. Harrison Sub. 38 North Network
4. Van Ness Sub. 129 Connecticut Ave. North Network
5. 12th and Irving Sub. 133 East Network
6. ”I” St. Sub. 197 East Network
7. Van Ness Sub. 129 Wisconsin Ave. South
8. Buzzard Point Sta. B Southeast Network

SECTION 4.2 – TECHNICAL TERMS AND DIAGRAMS

This section contains definitions, explanations and diagrams used in discussing electric system operations, design characteristics, and performance.

Alternating Current (AC)
A current, which reverses at regularly recurring intervals of time and that has alternately positive and negative values.

Ampere
The "ampere" is the basic unit of current equal to the flow of one coulomb of charge passing a point in one second. It is also the amount of current that is allowed to flow when a difference of potential of one volt is applied to a resistance of one ohm.

Ampere-hour
The flow of current per hour. Ten ampere-hours is equal to the flow of 10 amperes for a period of one hour or the flow of one ampere for ten hours.

Arrester
A device that provides an alternate path for surge currents caused by over-voltage resulting from lightning or switching surges.

Battery
Two or more cells electrically connected for producing electric energy. A device that transforms chemical energy into electric energy.

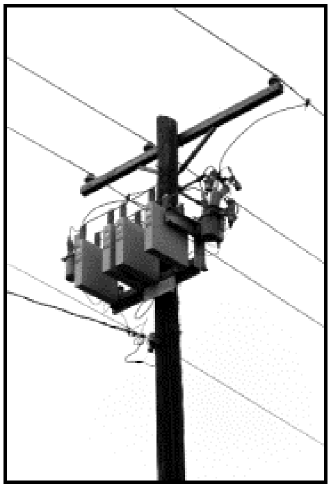
Cable Joint
A connection between two or more separate lengths of cable with the conductors in one length connected individually to conductors in other lengths and with the protecting sheaths so connected as to extend protection over the joint.

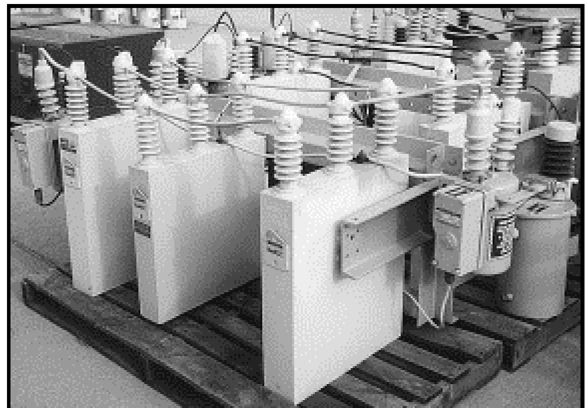
Cable Rack
A device usually secured to the wall of a manhole, cable raceway, or building to provide support for cables.

Cable Splice
See Cable Joint

CAIDI (Customer Average Interruption Duration Index)
Represents the average time required to restore service to the average customer per sustained interruption. Mathematically equal to SAIDI divided by SAIFI.

Capacitor
An electrical device for storing a charge of electricity and returning it to the line. It is used to balance the inductance of a circuit, since its action is opposite in phase to that of inductive apparatus; it throws the current ahead of the electromotive force in phase. It is made of alternate plates of tinfoil and insulating material. The size of plates and the thickness of insulating material determine the capacity for holding electric charge. Capacity is measured, practically, in micro-farads, millionths of a farad.





Capacitors

Circuit
A conductor or system of conductors through which an electric current is intended to flow.

Circuit Breaker
A device designed to open and close a circuit by non-automatic overload of current without damage to itself when properly applied within its rating.

Conductor
A material that allows the flow of electricity; a metal wire, in the center of an electrical cable, through which current flows.

Conduit
A pipe, most often made of polyvinyl chloride, used for the installation of cables underground.

CPI (Composite Performance Index)
A distribution feeder performance measuring index created by combining 4 industry standard reliability indicators. The indicators used in CPI are Number of Interruptions (NI), Number of Customer Hours of Interruption (CHI), System Average Interruption Frequency (SAIF) and System Average Interruption Duration (SAID).

Cycle
One complete set of positive and negative values of an alternating current.

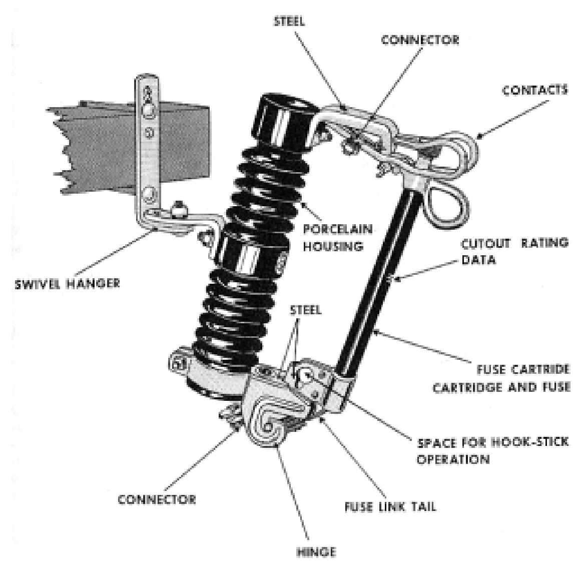
Duct
A single enclosed runway for conductors or cables.

Duct Bank
An arrangement of conduit providing one or more continuous ducts between two points.

Efficiency
The ratio of the useful output to the input of energy, power, quantity of electricity, etc.

Fault Current
A current that flows from one conductor to ground or to another conductor owing to an abnormal connection (including an arc) between the two. Note: A fault current flowing to ground may be called a ground fault current.

Fuse
An electrical safety device consisting of, or including, a wire or strip of fusible metal that melts and interrupts the circuit when the current exceeds a particular amperage.



Fuse Cutout
A device that is used to de-energize and re-energize components. A fuse cutout contains a fuse, which protects the line and components from the effect of overloads and faults.

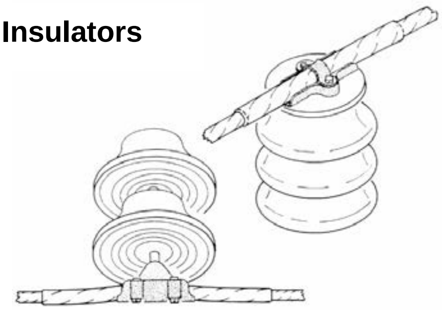
Fuse Element
The part of a fuse that melts and interrupts the circuit when excessive current flow occurs.

Ground
A conducting connection, whether intentional or accidental, by which an electric circuit or equipment is connected to the earth or to some conducting body that serves in place of the earth.

Inductance
The process that produces a voltage due to interaction of a conductor, a magnetic field, and relative motion between them.

Insulator
A material that offers a great deal of resistance to electron flow.

Insulators

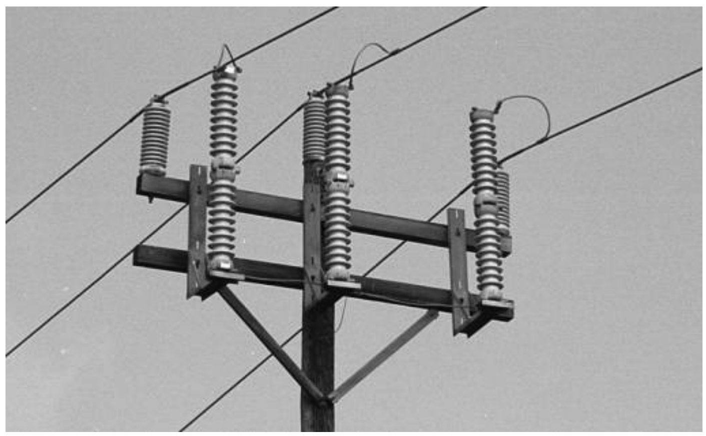


Kilowatt-Ampere (kVA)
The unit of apparent power in alternating current circuits as distinguished from kilowatts which represent true power.

Kilowatt (kW)
A unit of electric power equal to one thousand watts.

Kilowatt-hour (kWh)
The work performed by one kilowatt of electric power during one hour.

Lightning Arrester
A device that has the property of reducing the voltage of a surge applied to its terminals by the surge current to ground. It is capable of interrupting follow current if present and restores itself to original operating conditions.



Load Factor
The ratio of the average load over a designated period of time to the peak load occurring in that period.

Low Voltage (LV)
600 volts and lower.

Manhole
A subsurface chamber, large enough for a man to enter, in the route of one or more conduit runs and affording facilities for placing and maintaining in the runs, conductors, cables, and any associated apparatus.

Megawatt (MW)
One million watts.

Network
An aggregation of interconnected conductors consisting of feeders, mains, and services.

Overload
A load greater than the rated load of an electrical device.

Paper-Insulated Lead Cable (PILC)
A primary cable designed with paper insulation wrapped around a shielded conductor and covered with a flexible lead covering.

Phase
The relative time of change in values of current or electromotive force. Values that change exactly together are in phase. Difference in phases is expressed in degrees, a complete cycle or double reversal being taken as 360 deg. A 180-deg phase difference is complete opposition in phase.

Polychlorinated Biphenyls (PCB)
A toxic environmental contaminant requiring special handling and disposal in accordance with US Environmental Protection Agency Regulations. No longer used in transformers.

Pothead
A device used to protect the connection between a URD and an overhead system. A pothead also provides a termination for the URD cable insulation.

Power
The rate of doing work or the rate of expending energy. The unit of electrical power is the watt. Power is calculated by multiplying current time voltage.

Power Factor (pf)
The ratio of the actual power of an alternating current as measured by a wattmeter, to the apparent power, as indicated by ammeter and voltmeter reading. The power factor of an inductor, capacitor or insulator is an expression of their losses. The ratio of total watts to the total root-mean-square (RMS) volt-amperes. It is a mathematical term whose value is less than or equal to unity, or one. This term is used to show the relationship between volt-amperes (which is the basis for rating transformers, generators, etc.) and watts which is the measure of usable power delivered. A low power factor results in a lower usable power delivery or consumption for a given value of electric current than would result with a high power factor. The result of a low power factor is higher losses through the wires, cables, and other electrical apparatus.

$$pf = \frac{\sum Watts}{\sum RMS\ VoltsxAmperes}$$

Preassembled Aerial Cable (PAC)
Preassembled Aerial Cable (PAC) is an installation of three single underground cables triplexed together and installed on the overhead distribution system in heavily wooded areas. Each of the three conductors is a fully insulated cable grouped together in a package that is supported by a metallic messenger. The installation is more robust than tree wire and has the ability to withstand falling tree limbs.

Primary Circuit
The higher voltage circuit in a URD system that carries power to the transformers.

Protective Relay
A relay whose function is to detect conditions of an abnormal or dangerous nature and to initiate appropriate control circuit action.

Reactive Power
The product of voltage and the out-of-phase component of alternating current, generally measured in kilovars (kVAR). Reactive power decreases the substation's ability to deliver real power and increases system losses.

Reactor
A device, the primary purpose of which is to introduce reactance into a circuit.

230 kV Reactor

Real Power
The rate, generally measured in kilowatts (kW), of generating, transferring, or using energy. The power which serves the customers' end-use electrical devices and the power for which the customer is metered.

Relay
An electric device that is designed to interpret input conditions in a prescribed manner and, after specified conditions are met, to respond to cause contact operation or similar abrupt change in associated electric control circuits.

Remote Terminal Unit (RTU)
A device that controls substation equipment.

SAIDI (System Average Interruption Duration Index)
Average time customers are interrupted. Mathematically equal to the sum of Customer Interruption Hours divided by Total Number of Customers Served.

SAIFI (System Average Interruption Frequency Index)
Average frequency of sustained interruptions per customer. Mathematically equal to the sum of Number of Customer Interruptions divided by Total Number of Customers Served.

SCADA (Supervisory Control and Data Acquisition) System
A system that allows dispatchers to monitor and control substation equipment from a central location; also provides documentation for record keeping.

Secondary
Referring to the energy output side of transformers or the conditions (voltages) usually encountered at this location.

Short-Circuit
An abnormal connection of relatively low resistance, whether made accidentally or intentionally, between two points of different potential in a circuit.

Splice
A joint used for connecting in series, two lengths of conductor or cable.

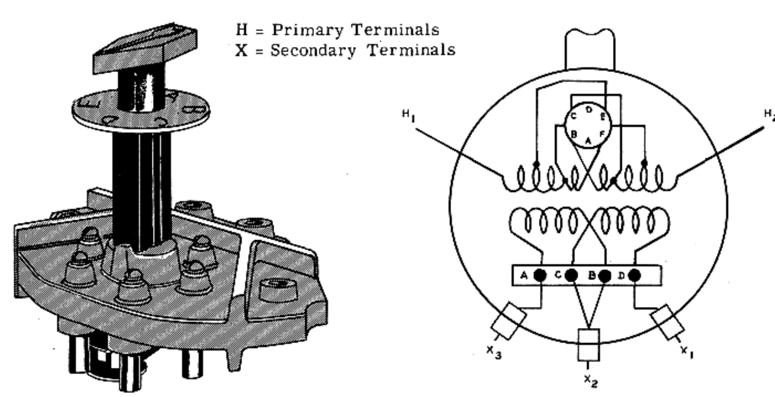
Substation
An assemblage of equipment for purposes other than generation or utilization, through which electric energy in bulk is passed for the purpose of switching or modifying its characteristics. Note: A substation is of such size or complexity that it incorporates one or more buses, a multiplicity of circuit breakers, and usually is either the sole receiving point of commonly more than one supply circuit, or it sectionalizes the transmission circuits passing through it by means of circuit breakers.

Mobile Substation

Switchgear
A general term covering switching and interrupting devices and their combination with associated control, metering, protective, and regulating devices, also assemblies of these devices with associated interconnections, accessories, enclosures, and supporting structures, used primarily in connection with the generating, transmission, distribution and conversion of electric power.

Tap
Connections that allow a transformer's turns ratio to be adjusted by adding turns to or subtracting turns from the transformer's primary or secondary winding. A connection brought out of a winding at some point between its extremities to permit changing the voltage or current ratio (general). An intermediate point in an electric circuit where a connection may be made.

A Tap Changer is Used to Adjust the Turns Ratio of a Transformer



No Load Tap Changer

Typical Internal Wiring of Transformer with Tap Changer

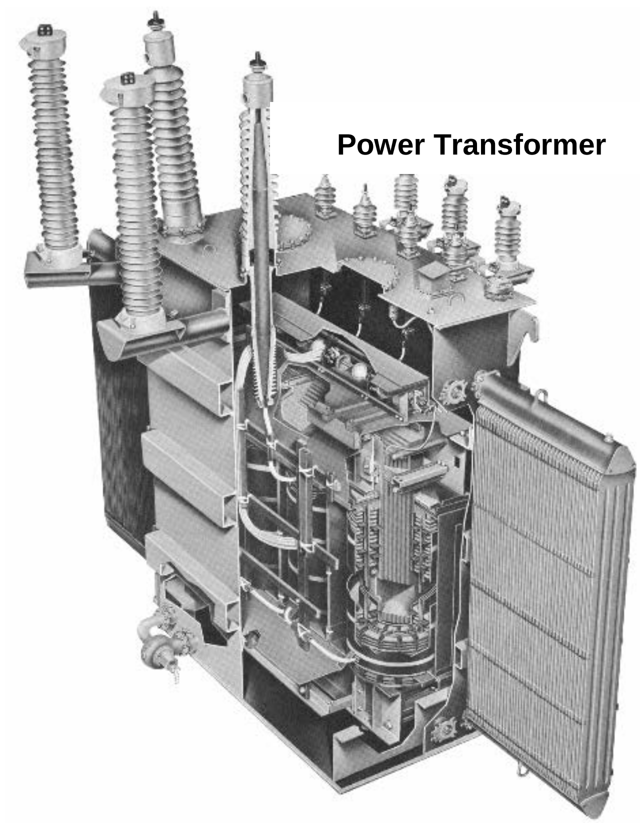
Tap Changer
A device for changing the turns ratio of a transformer.

Telemetering
Transmission of intelligence such as meter readings over a fairly long distance, usually from stations to the dispatcher's office, by direct wire or carrier current.

Three-Phase Circuit
A combination of circuits energized by alternating voltages that differ in phase by one-third, that is, 120 degrees.

Three-Wire System
A system of electric supply comprising three conductors, one of which, known as the neutral wire, is maintained at a potential midway between the potential of the other two, referred to as the outer conductors. There are two distinct voltages of supply, one being twice the other.

Transformer
A component used to change AC voltage to meet specific requirements. A device consisting of a winding with tap or taps, or two or more coupled windings, with or without a magnetic core, for introducing mutual coupling between electric circuits.



Transmission Line
A line used for electric-power transmission.

URD System
A local distribution system designed primarily to be buried in the ground and to serve residential customers.

VAR
Reactive volt-amperes.

Volt
Unit of measure for voltage. One volt is defined as the voltage necessary to drive a current of one ampere through a resistance of one ohm.

Voltage
Electric potential or potential difference expressed in volts.

Watt
Unit of measure for electric power, equal to the amount of power produced when one volt causes one ampere of current to flow.

Watt-hour

Basic unit used to measure electrical energy. Watt-hours are determined by multiplying power by time. One watt-hour is the amount of energy used when one watt of power is delivered to an electrical device for one hour.

SECTION 4.3 – SELECTED COMMISSION ORDERS

COMPREHENSIVE PLAN

System Planning

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. The Commission requested that the Company provide a Comprehensive Plan detailing proposed changes to the electric system for the purposes of meeting load growth or maintaining system reliability. On pages 143-144 of the hearing transcript, Pepco's witness Mr. Gausman explained the nature of the Company's existing plans for the distribution and transmission systems:

> *We have plans for each of our substations in D.C., and in each of those plans we address the needs for that location, what the growth forecast is, what type of construction is going to be needed for expansion in the distribution system in each of those locations… Now when you go up to the transmission level or the substation supply level, there you have a plan that is addressing a larger area of the town because you're looking at the whole capacity of the system.*

The Company expanded its responses to the Commission's requests in the first filed Comprehensive Plan. Since that date, the Company's Comprehensive Plans have been expanded based on several Commission directives. The report that follows either expands upon the discussion in the initial hearings requesting the Consolidated Report or responds to subsequent Commission directives as cited below.

The following section of the report addresses system plans based on forecasted load growth.

In Order No. 12804 paragraph 53 B, the Commission stated the following:

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO:*
>
> *(b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report;*

Load Forecasting

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, the following topics were discussed, as cited on pages 141-144 of the hearing transcript:

- *Comprehensive long-term planning on the underground system*
- *Pepco's 10-year construction plans*
- *Distribution load growth forecasts by substation*
- *Transmission/substation supply load growth forecasts*

In order No. 12735 issued on May 16, 2003 the Commission stated at paragraph 139, the following:

139. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

(a) Customer growth projections by District of Columbia wards (including historical comparisons);

(b) Load growth projections encompassing commercial and residential development by District of Columbia wards (including historical comparisons);

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

In Order No. 12804 paragraph 53, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(a) Provide the projected zonal and projected default (i.e., SOS) load data for the District of Columbia to the PIWG on a quarterly basis as well as in the 2004 and subsequent PIPs;…

Power Factors

In Order No. 10133, the Commission directed Pepco to include performance factors relating to the transmission and distribution (T&D) system in future PIPs.

"PEPCO…was directed to…provide in future PIP reports forecasts of plant performance factors which are based on analyses of both the projected performance and the prior year's actual performance"(page 10, Section B).

"…the Commission finds it entirely appropriate to include performance measures for PEPCO's transmission and distribution in the mix of issues examined by the PIWG and reported in the PIP"(page 12, third paragraph).

By way of compliance with the above requirements, in the September 1993 PIWG Meeting, Pepco proposed reporting performance data on its 13 kV distribution substation power factors.

Substation

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (page 266 of the hearing transcript):

> *But what we were talking about here yesterday was that the comprehensive plan would include… any rebuilt substations you might have; any new substations you might have…*

Distribution

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (pages 266-267 of the hearing transcript):

> *But what we were talking about here yesterday was that the comprehensive plan would include… anything that you might envision to account for distribution load growth…*

In Order No. 12735 issued on May 16, 2003, the Commission stated the following at paragraphs 74 and 135:

74. During the November 2001 hearings the Commission requested that PEPCO submit a comprehensive plan to include a current assessment of, and future plans for, its underground distribution and network facilities.[179] The Commission requested the plan as a tool to evaluate PEPCO's planning methodology and to assess PEPCO's ability to anticipate and respond to changing conditions in its underground distribution system…

135. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

> *(c) Listing of underground distribution projects, such as the Adams-Morgan neighborhood project (including budgets, time schedules, and expected benefits) by secondary vs. primary system by District of Columbia wards affected, but not specific locations;*

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Technology

In Order No. 12804 paragraph 53 E, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

SCADA

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 313 of the hearing transcript, Commissioner Meyers stated the following:

We're going to ask Pepco to please include a section on reporting and monitoring in the comprehensive plan… And just as a quick for instance of this real-time systems control and data acquisition system, SCADA, what could it do? Give me a for instance there.

DA

In Order No. 12804 paragraph 53 E, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

OMS

In Order No. 13422 on the 2004 Consolidated Report, paragraph 66, the Commission stated the following:

66. The 2004 Consolidated Report: Productivity Improvement Plan and Comprehensive Plan is hereby APPROVED, provided that PEPCO:

(a) Report in the 2005 Consolidated Report, due February 15, 2005, on the corrective actions taken to fix the OMS;…

CIS

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 503 of the hearing transcript, Commissioner Meyers stated the following:

> *You've been a leader in CADS all along, computer assisted data systems. There's some discussion here about various other types of reporting and monitoring systems…*

Power Delivery Information Systems Projects

In Order No. 12735, paragraph 139, the Commission stated the following:

> *PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:…*
>
> *(d) Listing of power delivery information system projects with implementation schedules, annual costs, and milestones;*
>
> *(e) Listing of new technology investigations with decisions, annual costs, and implementation schedules;*
>
> *…The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.*

Equipment Standards

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 149 of the hearing transcript, Commissioner Meyers stated that the Comprehensive Plan should include:

> *…not only [the 10-year underground construction budget and 4 kV to 13 kV conversion], but… incorporating standards of what you want this to look like…*

Equipment Inspections

In Order No. 16091, paragraphs 46 and 63, the Commission stated the following:

> *46. Decision. … we shall require that Pepco provide a list of the types of equipment for which a "run to failure" method applies and those for which a preventive method applies. (Footnote: If other maintenance methods are used, Pepco shall describe them as well.) The Commission requires that Pepco provide an explanation of why different maintenance methods apply*

to different types of equipment. We also require a description of the "test procedures" that Pepco uses to assess the performance and remaining life of the equipment. (Footnote: See Pepco comments at 7.) Further, Pepco shall provide an estimate of the current book value of equipment maintained under each method used by Pepco. The 2011 Consolidated Report shall include this description of maintenance policies and methods.

63. Pepco IS DIRECTED to provide a description of its maintenance policies and methodologies, consistent with paragraph 46 of this Order;

Storm Readiness / ERIP

In Order No. 15152 at paragraph 71, the Commission ordered the following:

71. PEPCO is DIRECTED to prepare an action plan to reduce service restoration times and improve SAIDI and CAIDI performance, consistent with Order No. 14643 issued November 30, 2007 and herein, to be included in the 2009 Consolidated Report;

Order No. 15568 followed, requiring the following:

32. The Commission directs Pepco to report to each meeting of the PIWG on its Action Plan. That report should include a written description of the steps taken pursuant to the Plan. For example, in connection with the item that includes "Develop a process design and implement training," Pepco should describe the design and the training given to crews, including the number of employees who have availed themselves of the training. In addition, Pepco should be prepared to answer questions about the progress of the Action Plan from other members of the PIWG.

52. Pepco IS DIRECTED to report to each meeting of the PIWG on its Action Plan, consistent with Paragraph 32 of this Order;

Electricity Quality of Service Standards

Specific Consolidated Report requirements from the EQSS portion of the D.C.M.R. are listed below.

3602.6 Progress on current corrective action plans [on customer calls answered] shall be included in the utility's annual Consolidated Report.

3602.7 The utility shall report the actual call center performance during the reporting period in the annual Consolidated Report of the following year.

3602.12 Progress on any current corrective action plans [on call abandonment rates] will be included in the utility's annual Consolidated Report.

3602.13 The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3602.14 The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.

3602.21 Progress on any current corrective action plans [on new residential service installation requests] will be included in the utility's annual Consolidated Report.

3602.22 The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3603.5 The utility shall report on the progress of the corrective action plan [on repeat least performing feeders] in the Annual Consolidated Report submitted to the Commission.

3603.8 The utility shall report on the number and percentage of non-major service outages that extend beyond the twenty-four (24) hour standard and the reasons each such outage extended beyond the twenty-four (24) hour standard.

3603.9 The report drafted pursuant to Section 3603.8 shall be included in the annual Consolidated Report on reliability data.

3603.16 The utility shall report on the progress of the corrective action plan [on SAIFI, SAIDI and CAIDI benchmarks] in the annual Consolidated Report submitted to the Commission.

3603.17 The utility shall also, per the orders of the Commission, continue current requirements of reporting annual reliability indices of SAIFI, SAIDI and CAIDI (with and without major events) in the annual Consolidated Report of the following year.

Industry Comparisons

In Order No. 15568 paragraph 57, the Commission ordered the following:

57. Pepco IS DIRECTED to provide a report on the Electric Utilities Best Practices, consistent with Paragraph 50 of this Order. This report shall be included in that 2010 Consolidated Report; and shall include the best practices of the electric utility industry on improving reliability and outage restoration (from the Benchmarking Studies). Pepco shall submit a continuous improvement plan, including resourcing, specific performance targets, and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparable) utilities in the Benchmarking Studies.

Implementation of Twenty Best Practices

In Order No. 16091 paragraph 61, the Commission stated the following:

61. Pepco IS DIRECTED to include a "2011 Best Practices Report" in its 2011 Consolidated Report describing its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program, consistent with Paragraph 22 of this Order;

22. Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568. Second, as to the Staff's Recommendation that Pepco file a "Best Practices Report" from the PA Consulting's 2009 Polaris Transmission and Distribution Benchmarking Program, we agree that a report may be helpful in assuring that best practices continue to be implemented. Therefore, the

> *Commission shall require that Pepco include in its 2011 Consolidated Report a section entitled "2011 Best Practices Report" in which Pepco shall describe its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program included in the 2010 Consolidated Report as Appendix 2D. The twenty best practices selected by Pepco should be those judged to have the most impact on reliability and outage restoration performance. Pepco shall report on all its activities during 2010 to implement these best practices, including data on staffing levels, expenses and results. This requirement is separate from the requirement to produce a "Continuous Improvement Plan," as is described more fully in Section IV.A.1.f.*

PA Consulting Recommendations

In Order No. 15632 issued in these proceedings, the Commission states at paragraph 5 the following:

> *5. Pepco shall file with the Company's annual Consolidated Reports to the Commission data on the Company's measures to continue to address each of the recommendations made by PA Consulting and the effectiveness of the Company's approaches to improve CAIDI and SAIDI to at least the average of PA Consulting benchmarks. This obligation shall begin with the 2010 Consolidated Report.*

In Order No. 15568 issued October 7, 2009 in these proceedings, the Commission states at paragraph 52 the following:

> *52. Pepco IS* ***DIRECTED*** *to report to each meeting of the PIWG on its Action Plan, consistent with Paragraph 32 of this Order;*
>
> *32. The Commission directs Pepco to report to each meeting of the PIWG on its Action Plan. That report should include a written description of steps taken pursuant to the Plan. For example, in connection with the item that includes "Develop a process design and implement training." Pepco should describe the design and the training given to the crews, including the number of employees who have availed themselves of the training. In addition, Pepco should be prepared to answer questions about the progress of the Action Plan from other members of the PIWG.*

In Order No. 16091 issued in these proceedings, the Commission states at paragraph 22 the following:

22. *Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568.*

PRODUCTIVITY IMPROVEMENT PLAN

Productivity Improvement Plan

In Order No. 15152 on the 2008 Consolidated Report, paragraph 68, the Commission ordered the following:

68. The Productivity Improvement Working Group, which includes OPC, provided a reasonable definition of a productivity improvement project in 2006. Specifically, the PIWG states:

> *T&D productivity improvement projects were considered those projects that will increase T&D system efficiency by reducing losses and improve[ing] system reliability, and which may defer more costly additions to the electric system. (Footnote: F.C. No. 766, Decision on Consideration of OPC's T&D Productivity Improvement Working Group in Response to Commission Order No. 13754, filed July 6, 2006 ("2006 PIWG Report"), at 2.)*

The power serving the District's Standard Offer Service customers is now procured through a wholesale procurement process by PEPCO and, as such, productivity improvement is applicable only to transmission and distribution issues. We find the PIWG's definition of a productivity improvement project workable and adopt it here.

69. The PIWG also provided a reasonable definition of comparative cost analysis for reliability projects. The PIWG suggested that the comparative cost analysis used for reliability projects should "consist of a comparison of the cost of alternative reliability improvement solutions as well as any differences in relative reliability improvement." (Footnote: 2006 PIWG Report at 2.) …

Reliability Statistics

Page 190 of the transcript for the November 5-7, 2001 hearings documents Commissioner Cartagena as stating the following:

You testified earlier that you have a 10-year plan for updating the system or addressing whatever changes are required with regards to that. Does that 10-year plan contain reliability goals or other measurable performance objectives? In other words, are there some kinds of standards that we can look at and will give us an idea of whether the company is hitting or missing those standards and objectives with regards to its plan?

This section of the Consolidated Report addresses the Company's performance with respect to reliability standards and Electricity Quality of Service Standards.

Targeted Reliability Indices

In Order No. 12735, paragraph 139, the Commission ordered the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

(f) Targeted reliability indices (including historical comparisons); and

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Also, in paragraph 142, the Commission directed the Company to file performance indices for the District of Columbia only.

PEPCO is DIRECTED to work with the PIWG to develop target system reliability indices for the District of Columbia, only.

Vegetation Management

In Order No. 15621 at paragraph 5, the Commission ordered the following:

5. *Pepco shall file within the Company's annual Consolidated Reports to the Commission, yearly data on tree trimming by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports beginning with the Company's 2010 Consolidated Report.*

Priority Feeders & Aggressive Initiatives

The Electricity Quality of Service Standard D.C.M.R. 3603.6 states the following:

3603.6 The utility shall continue the current reporting of the worst performing (lowest two (2) percent) feeders (utility methodology) and corresponding corrective action plans, with the action taken in year 1 and the subsequent performance in year 2 in the annual Consolidated Report.

In Order No. 15152 paragraph 73, the Commission ordered the following:

73. Pepco is DIRECTED to investigate the viability of the "aggressive" initiatives for all least performing feeders, to file a progress report regarding the implementation of these initiatives where viable as part of the 2009 Consolidated Report, and to file quarterly progress reports thereafter, consistent with paragraph 62 of this Order;

In Order No. 15809 paragraph 11, the Commission ordered the following:

11. Pepco IS DIRECTED to include in its 2011 Consolidated Report a plan for development and application of "aggressive initiatives" to its underground distribution feeders;

Repeat Priority Feeders

In Order No. 15152 issued on Pepco's 2008 Consolidated Report, the Commission stated (at paragraph 72),

*72. PEPCO is **DIRECTED**, beginning with the 2009 Consolidated Report, to identify the feeders that are part of the separate annual program of corrective actions for reappearing least reliable feeders, describe the corrective actions planned for each feeder and the projected dates for completion of the corrective actions and explain whether the corrective actions improved the performance of these feeders consistent with paragraph 59 of this Order;*

In Order No. 15941 issued on August 18, 2010, the Commission stated at paragraphs 13 and 16, the following:

13. Beginning with the 2011 Consolidated Report, Pepco shall identify any feeders that have appeared more than once on the Priority Feeder List, by year from the first Priority Feeder List in 2002, so that it shall be apparent how many times each feeder has appeared on the Priority Feeder List…

16. Pepco IS DIRECTED to identify in its 2011 and successive Consolidated Reports, each feeder that has appeared more than once on the Priority Feeder List.

4 to 13 kV Conversions

These projects are a continuation of the 2011 Reliability Projects, as required by Order No. 16091 at paragraph 64 and referenced paragraphs 50 and 53:

*64. Pepco IS **DIRECTED** to provide detailed schedules and budgets for conversion projects, as well as justification for any non-minor deviations from these , consistent with Paragraphs 50 and 53 of this Order;*

50. <u>Decision.</u> We agree with the Staff recommendation and require Pepco to provide justification for any deviations from the plan schedules and annual budgets for 4 kV to 13 kV conversion projects in its Consolidated Reports, excluding minor deviations of less than 5%.

This information may be provided in the discussion of "Reliability Projects."

53. *Decision. …we have not adopted the Staff's "replace or rebuild" recommendation. However, we agree that future Consolidated Reports should contain detailed schedules and budgets for Reliability Projects, as well as justification for deviations from those schedules and budgets. We shall require Pepco to submit such schedules in future Consolidated Reports.*

Manhole Event Report

In Order No. 16091 issued on December 10, 2010, the Commission stated at paragraphs 56, 59, 65, and 66 the following:

56. *Decision. Pepco has agreed to make the recommended changes in the 2011 Consolidated Report with the exception of data on failure rates. We require that the members of the PIWG discuss the need for and feasibility of providing data on failure rates in future Consolidated Reports and include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.*

59. *Decision. We adopt the Staff's recommendation and require Pepco to: (1) combine the Manhole Events portion of the failure analysis report with Part 3 of the Consolidated Report; (2) include data in the 2011 Consolidated Report that separates 4 kV primary failures from 13 kV primary failures; (3) include data in the 2011 Consolidated Report that separates 4 kV from 13 kV manhole events; (4) include trend analyses for "Use of Slotted Manhole Covers;" and (5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable. If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.*

65. *Pepco IS DIRECTED to include a discussion of failure data rates in the agenda for the Productivity Improvement Working Group, consistent with Paragraphs 56 and 59 of this Order; and*

66. *Pepco IS DIRECTED to include additional Manhole Event data in the 2011 Consolidated Report, consistent with Paragraph 59 of this Order.*

In Order No. 15152 paragraphs 76 and 66, the Commission ordered the following:

76. *PEPCO is DIRECTED to include as part of the 2009 Consolidated Report a proposed plan for significantly reducing manhole events consistent with paragraph 66 of this Order…*

In Order No. 12735, paragraph 138, the Commission ordered the following:

Pepco shall file a report that summarizes the results of the failure analyses conducted for the calendar year 2002, 30 days from the issuance date of this Report and Order, and subsequently, to file an annual report on the results of the failure analysis group to the PIWG;

Slotted Manhole Covers

In Order No. 16091 issued on December 10, 2010, the Commission stated among other things, at paragraph 59, the following:

59. …(4) include trend analyses for "Use of Slotted Manhole Covers;"
60.

Cable Splice or Joint Database

In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. *…(5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable.*

Failure Rates

In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. …(5)…If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such *data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.*

Appendix 3A – 2011 Manhole Events and Summary of Selected Failures

In Order No. 11716 ordering paragraph 3, the Commission ordered the following:

PEPCO shall file an annual report on the previous calendar year's manhole incidents;

Appendix 3B – 2011 Manhole Inspection Program

In Order No. 11716, the Commission stated the following:

PEPCO is hereby directed to include the following information in its [manhole inspection] reports beginning in July 2000:

1. *The general location of the manholes inspected, including the street or streets where the manholes are located and the blocks bounding the street, e.g., M Street, NW, between 23rd and 28th streets;*
2. *The number of manholes inspected in the month, broken down as to the number of manholes containing primary cables only, both primary and secondary cables, and secondary cables only;*
3. *The number of primary cable problems found;*
4. *The number of secondary cable problems found;*
5. *The type of cable problems found in each manhole, categorized as to the physical degradation or damage of the cable, overheating, overloading, damaged splice and deteriorated cable or splice due to age;*
6. *The number of manholes with problems;*
7. *The corrective actions taken for each cable and manhole problem found; and*
8. *Other general condition of the manhole such as whether it contained water, oil, grease, debris, and whether the manhole cover and the manhole are in good mechanical condition.*

SECTION 4.4 – COMPOSITE PERFORMANCE INDEX[88] [89]

The Company has discontinued use of CPI to select feeders for inclusion in its 2% Priority Feeder program; however, in compliance with Order No. 16975, the Company still tracks and performs remediation work on feeders that would have been on the list using CPI selection methodology.

[88] In Order No. 15152 paragraph 74, the Commission ordered the following:

> *74. Pepco is DIRECTED to provide more detail, in the 2009 Consolidated Report, regarding how it applied the Composite Performance Index methodology in identifying the list of 2008 High Priority Feeders consistent with paragraph 65 of this Order;*
>
> *65. Although PEPCO uses the Composite Performance Index as the methodology for identifying high priority feeders, OPC asserts that it is unclear how the methodology was applied in this instance. Essentially, OPC believes that PEPCO should provide more detail on the particular inputs and variables used in the CPI process. OPC also maintains that the comparisons between PEPCO and other utilities (PSE&G Benchmarking Study, SEE study, and the Large City Reliability Survey) would be more useful if the data were "disaggregated" among those parts of the distribution system "served by underground networks, by underground radial and by overhead radial." If that data is not available, OPC believes that it would be helpful to know the percentage of each of the surveyed utilities' distribution system that is served by "these system designs." According to OPC, the disaggregated information would provide the basis for "a more thorough analysis" when comparing PEPCO's reliability performance with other utilities. Staff similarly believes that PEPCO should provide more detail on how it applied the CPI methodology and that the comparative information should be disaggregated. The Commission is of the view that the recommendations have merit and directs PEPCO to submit the additional information in the 2009 Consolidated Report.*

[89] Order No. 16975 states the following at paragraph 60:

> *60. The Commission notes that in recent PIWG meetings, Pepco has indicated its intention to change the methodology which it uses to determine Priority Feeders. A change in methodology would diminish the value of the Priority Feeder List in determining historically poorly performing feeders and would lessen our ability to track and compare the historical data. Therefore, we require Pepco to provide two Priority Feeder Lists, using both the historical (CPI) and any new methodologies in the 2013, 2014 and 2015 Consolidated Reports.*

CPI, which is unique to Pepco, has historically been used to evaluate and rank feeder performance. CPI was developed at Pepco many years ago and more recently underwent refinement by PA Consulting (formerly PHB-Hagler Bailly). The Company used CPI to track feeder performance, incorporating all appropriate variables, and to track results of improvement efforts.

CONCEPTUAL FRAMEWORK

CPI is not only calculated on basic variables (interruptions, duration, customers affected, etc.), but also on averaged or combined indices such as System Average Interruption Frequency (SAIF) and System Average Interruption Duration (SAID). In total, CPI is composed of four measurements that are applied to each feeder:

- Number of Interruptions (NI),
- Number of Customer Hours of Interruption (CHI),
- System Average Interruption Frequency (SAIF), and
- System Average Interruption Duration (SAID).

The basic concept behind CPI and the statistical model is to plot a feeder in 4 dimensions and measure its distance from the point representing the "ideal" feeder. It is a statistical effort to locate any ***outliers*** in these categories or a combination of them. It is a sort of weighted average of the 4 indicators from different angles in a space.

However, because the 4 measures are not independent of each other, it requires a linear transformation (scaling and rotating) of the original data as well as a reduction of dimensions considered relevant. To understand the dependence between indicators/measures and the reduction in dimensions, consider the case of determining the winner of a decathlon. Even though there are 10 original tests (dimensions), the winner should be the athlete that proves best in perhaps 4 underlying characteristics (principal components): velocity, strength, resistance and agility. Several tests are correlated as they address similar abilities to differing degrees:

- Velocity – short races, hurdles, broad jump, high jump, javelin, pole vault
- Strength – broad jump, high jump, javelin, pole vault, shot put, discus
- Resistance – long races, and the set of all tests together
- Agility – hurdles, pole vault, high jump

To avoid redundancy, the method to determine the winner should try to extract the scores on the 4 principal components and calculate the results based on them. In the case of CPI, the method for determining feeder performance starts with 4 variables and creates Principal Components, and mean and standard deviations for 4 variables. It then transforms the raw value of the feeder and the origin to calculate the CPI index over 3 principal components.

Figure 4.4-A illustrates the CPI concept spatially, and Figure 4.4-B explains CPI process in detail.

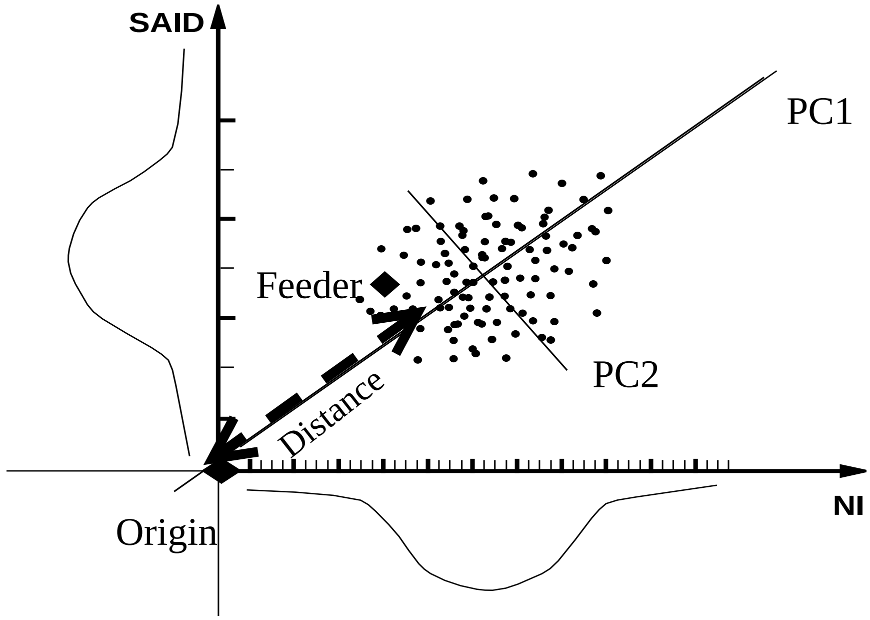


Figure 4.4-A: CPI Spatial Concept

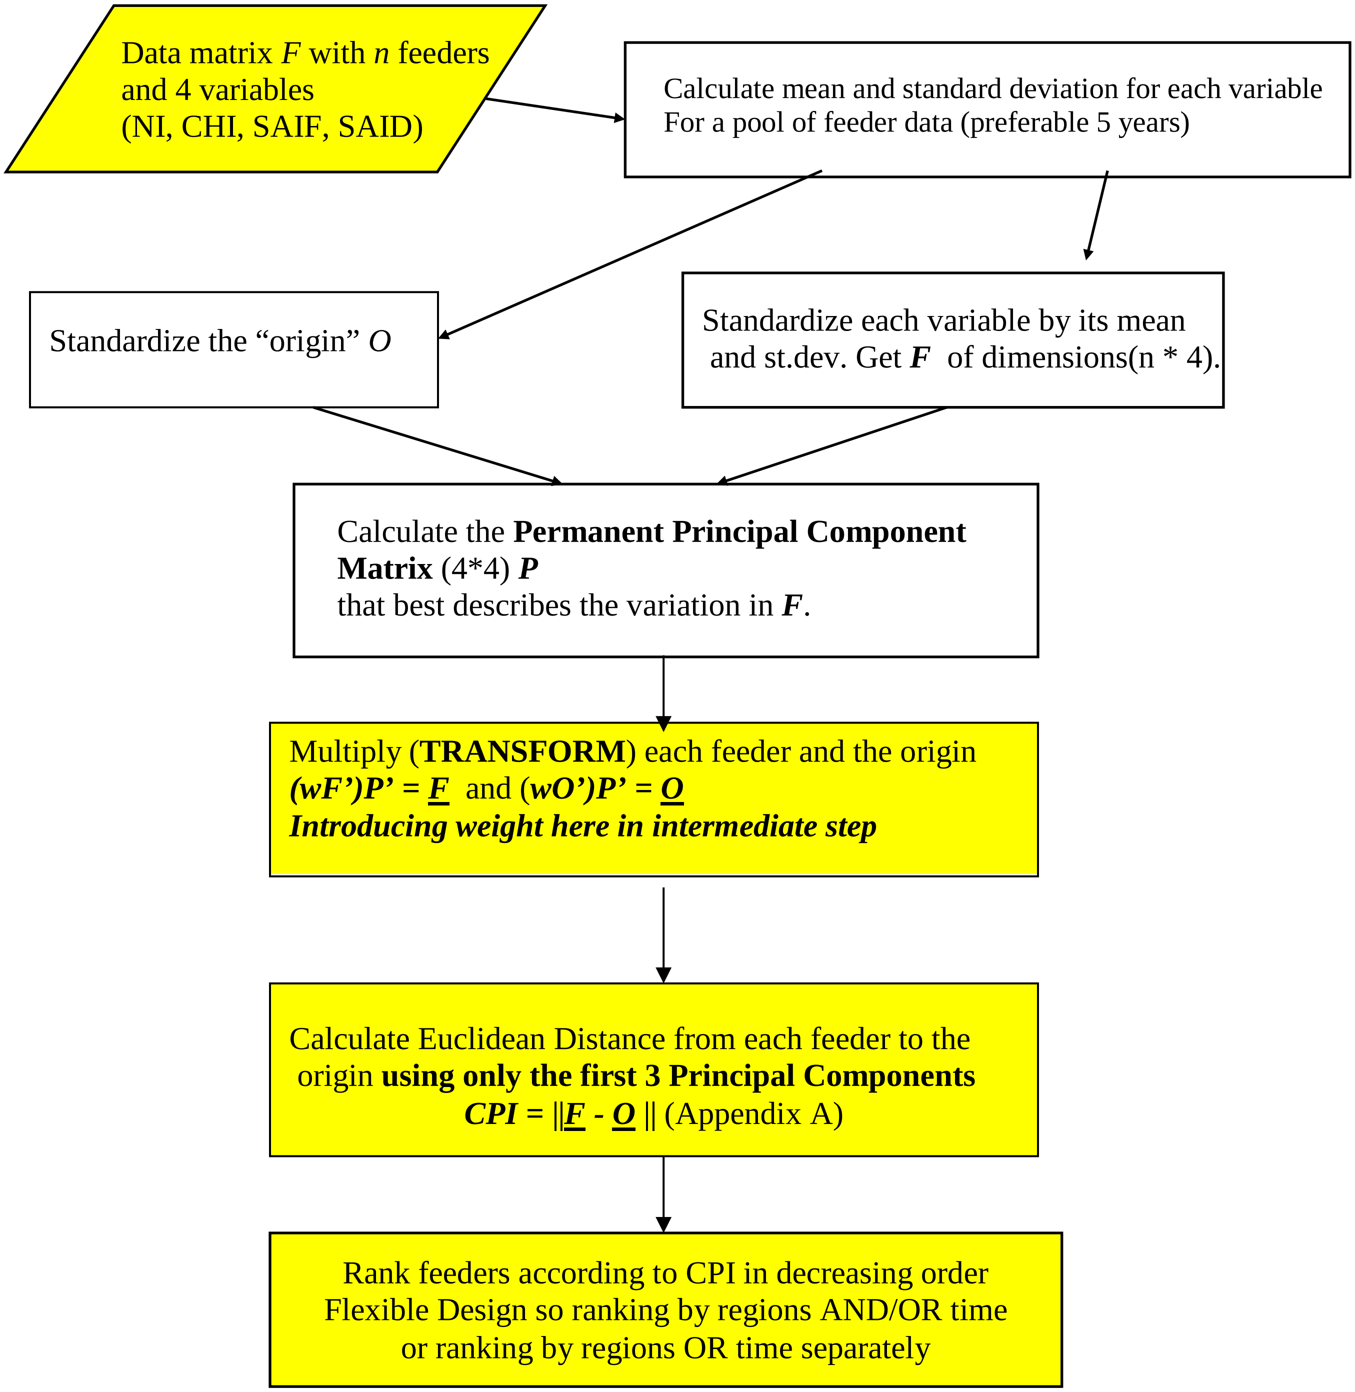
<u>DESCRIPTION OF CALCULATION PROCESS</u>

The following flow chart (Figure 4.4-B) illustrates the process for calculating the Composite Performance Index for a feeder.



<u>Figure 4.4-B -- Illustration of CPI Concept</u>

Description of Euclidean Distance to Derive CPI

Definitions

Principal Component Matrix (each row is Principal Component vector)

$$P = \begin{bmatrix} PC_1 \\ PC_2 \\ PC_3 \\ PC_4 \end{bmatrix} = \begin{bmatrix} pc_{1,NI} & pc_{1,CHI} & pc_{1,SAIF} & pc_{1,SAID} \\ pc_{2,NI} & pc_{2,CHI} & pc_{2,SAIF} & pc_{2,SAID} \\ pc_{3,NI} & pc_{3,CHI} & pc_{3,SAIF} & pc_{3,SAID} \\ pc_{4,NI} & pc_{4,CHI} & pc_{4,SAIF} & pc_{4,SAID} \end{bmatrix}$$

Original Feeder Data

$$originalFeeders = F = \begin{bmatrix} f_{1,NI} & f_{1,CHI} & f_{1,SAIF} & f_{1,SAID} \\ f_{2,NI} & . & . & . \\ . & . & . & . \\ f_{n,NI} & . & . & f_{n,SAID} \end{bmatrix}$$

Weight

$$W = \begin{bmatrix} w_{NI} & 0 & 0 & 0 \\ 0 & w_{CHI} & 0 & 0 \\ 0 & 0 & w_{SAIF} & 0 \\ 0 & 0 & 0 & w_{SAID} \end{bmatrix}$$

Standard Deviation

$$\Sigma = \begin{bmatrix} \sigma_{NI} & 0 & 0 & 0 \\ 0 & \sigma_{CHI} & 0 & 0 \\ 0 & 0 & \sigma_{SAIF} & 0 \\ 0 & 0 & 0 & \sigma_{SAID} \end{bmatrix}$$

Intermediate Calculations

$$M = \Sigma * W = \begin{bmatrix} \frac{w_{NI}}{\sigma_{NI}} & 0 & 0 & 0 \\ 0 & \frac{w_{CHI}}{\sigma_{CHI}} & 0 & 0 \\ 0 & 0 & \frac{w_{SAIF}}{\sigma_{SAIF}} & 0 \\ 0 & 0 & 0 & \frac{w_{SAID}}{\sigma_{SAID}} \end{bmatrix}$$

Transformation

$$\hat{F} = F * M * P'$$

$$\hat{F} = \begin{bmatrix} f_{1a} & f_{1b} & f_{1c} & f_{1d} \\ f_{2a} & . & . & . \\ . & . & . & . \\ f_{na} & . & . & f_{nd} \end{bmatrix}$$

Where

F is the original feeder data matrix (size n*4)

M is the intermediate calculation matrix (size 4*4)

P' is the (transposed) principal component matrix (size 4*4)

Finalization of CPI – Euclidean Distance Method

For each feeder *i* take the values for the 3 first components of row *i* in the last matrix above.

$$CPI_{f_i} = \sqrt{f_{ia}^2 + f_{ib}^2 + f_{ic}^2}$$

REP Work Plan Summary

Project Name	Project Description	Performance Metric	Miles/Feeders
Vegetation Management	Program to address vegetation, designed to maintain appropriate clearance on the system, remediate trouble spots (e.g., Priority Feeders), and remove the vegetation hazards that have the greatest impact on system reliability.	Annual tree related SAIFI/SAIDI performance for all feeders.	Number of miles pruned
Feeder Improvement	Program to address equipment, vegetation, weather, and animal-related interruptions which negatively impact reliability performance. These projects involve installing, removing, and replacing reclosers, switches, conductors, animal guards, lightning arresters and other equipment deemed necessary on the worst performing, top SAIFI contributing, and high customer interruption feeders to maintain safe operation and improve reliability.	Annual cumulative SAIFI/SAIDI performance for all feeders included within the feeder improvement as well as feeders where DA has been installed and feeders are undergrounded.	Number of feeders impacted
URD Cable Replacement and Enhancement	Program to address reliability of the underground residential infrastructure. These projects involve replacing or rejuvenating underground residential distribution (URD) cable in order to minimize URD failures.	Annual number of underground (URD) cable failures.	Number of miles replaced/ injected
Distribution Automation	Program to address system reliability by deploying technology. These projects involve installing advanced control systems across the distribution system in order to automatically identify and isolate faults in real time and restore service to customers in the unaffected parts of the system.	Annual cumulative SAIFI/SAIDI performance for all feeders included within the feeder improvement as well as feeders where DA has been installed and feeders are undergrounded.	Number of ASR schemes
Conversions **Load Growth**	Program to address increasing load demands to maintain reliability and to ensure that future demands can be met under adverse conditions. These projects involve adding or upgrading feeders in order to reliably supply new customers and support increased usage required by existing customers.	Operate substations within design loading criteria.	N/A

Conversions	UDLPRM8BC	North Capital Sub 40: Convert 4 to 13kV	This project is being recommended to initiate infrastructure upgrades to the existing 4kV system in the North Capitol Street, Kennedy Street, and New Hampshire Avenue, NW area. The proposed 4 to 13 kV conversions will be accomplished by extending and/or rearranging existing or new 13 kV distribution feeders from Fort Slocum Sub. 190 beginning in 2014. The total amount to be converted is approximately 50,600 feet.	$5,432	$0	$6,215	$637	$2,400,732	$1,851,637	$1,106,935
	UDLPRM8BG	Convert portions of Fdrs 482 & 485 to Fdrs. 15006, 15012, 15015	1/09/13 The North Capitol Sub. 40 - 4kV system is an aging, isolated area on the Pepco distribution system that is not connected to any other 4kV substations or systems. Recent substation inspections have revealed deteriorating circuit breakers that are subject to a few failures that include a relatively high number of arc shute and internal problems. The current Preventive Maintenance Program for these breakers calls for them to be overhauled every 72 months. The aging switchgear necessitates the salvage of spare parts from like equipment. In the event of a catastrophic failure at North Capitol Sub. 40, no external 4kV support is available. 4kV feeders are of mostly older construction and backed up by other North Capitol Sub. 40 feeders or through bus ties. Capacity from nearby Fort Slocum Sub. 190 is readily available for the 4kV to 13kV conversions. Customers served by these feeders experienced a total of about 155,000 customer minutes of interruption in 2010.	$0	$0	$0	$0	$0	-$25,794	$0
	UDLPRM8BQ	Harrison-Van Ness: Convert Fdr 82 to 13kv	1/09/13 Extend and/or rearrange 4kV Feeder 82 (Veazey East Sub. 90-E & Nebraska Sub. 92) and Van Ness Sub. 129 – 13kV Feeder 14135 in the vicinities of Nebraska Avenue & Connecticut Avenue, NW and Connecticut Avenue & Chesapeake Street, NW to convert approximately 0.8 MVA of load from Feeder 82 to Feeder 14135.	$0	$0	$0	$0	$0	$1,428	$0
	UDLPRM8BI	Fort Carroll Sub. 130: Convert 4-13kV Conversion (UDLPRM8BI)	Converting approximately 26,000 circuit feet of overhead; Fort Carroll Sub. 130 approximately 20,000 feet, Congress Heights Sub. 64 approximately 6,000 feet.	$0	$0	$0	$0	$3,000,000	$664,206	$2,264,493
	UDLPRM8BT	Convert 4-13 kV-Georgetown	This is the continuation of Project M34 for the Georgetown infrastructure projects and will convert the remaining 4kV load supplied from this substation. The project will identify all required underground system modifications necessary to maintain and improve distribution facilities by converting to 13kV. Area 2B is the next location identified for conversion and encompasses between P and S Sts. east of Wisconsin Avenue, NW. 50,000 ft conduit, 115,000 ft cable, 8 3-way switches, 3 13/4 kV step-down transformers, replace secondary where needed.	$3,446,593	$624,307	$4,099,951	$3,528,582	$4,804,472	$7,009,228	$5,461,506
	UDLPRM8BU	Convert 4-13 kV-12th St.	The 12th Street Sub. 126 contains oil circuit breakers that will be removed based on review of condition and reliability. Both the 13 kV/4 kV transformers are identified as suspect and in need of eventual replacement. These oil circuit breakers are no longer manufactured and the manufacturer no longer provides spare parts. The existing conduit and cables are very old and upgrades of this system are being proposed to eliminate potential reliability concerns proactively.	$3,804,429	$65,144	$4,626,708	$1,668,848	$4,781,265	$5,592,139	$4,967,804

Conversions (con't)	UDLPRM8BY	Convert 4-13 kV-Harvard	This project is being recommended to continue infrastructure upgrades to the existing 4kV system in the Upper Shaw and Harvard/Columbia Heights areas. Two 13kV Feeders extended from Florida Avenue Sub. 10 in 2011 provide capacity for portion of the conversion and allow load to be transferred to Sub. 10 from Sub. 13. Existing 13kV Feeders from Sub. 13 and new 13kV Feeders from Sub. 25 will be used to convert the remaining 4kV load starting in 2014. Total amount to be converted is approximately 60,200 feet. Customers supplied from the Harvard 4 kV substation experienced a total of 2,831,000 customer minutes of interruption in 2010.	$5,437,077	$3,294,674	$6,018,784	$4,196,062	$7,426,308	$3,120,044	$6,157,051
			Conversions Total	$12,693,531	$3,984,125	$14,751,658	$9,394,129	$22,412,777	$18,212,888	$19,957,789
Load Growth	UDLPL10S1	Sub 52 South to Sub. 52 Central LVAC Cutover	Extend the 10th St Sub. 52 Central Low Voltage AC (LVAC) Group east along H St. from between 13th & 14th Sts. to 13th St., then south along 13th St. to between G St. and H St. using approximately 600' of new conduit and 3300' of new cable to transfer load from the Sub. 52 South LVAC Group.	$0	$0	$498,792	$117,578	$1,977,694	$2,620,810	$48,784
	UDLPL10S2	Sub 52 East to Sub. 52 North LVAC Cutover	Extend the 10th St Sub. 52 North Low Voltage AC Group west along F St from between 9th & 10th Sts to 10th St using approximately 500' of new conduit and 3000' of new cable to transfer load from the Sub. 52 East Group.	$0	$0	$535,985	$179,918	$327,694	$1,741,139	$48,784
	UDLPLALB1	Extend 4-13kv Feeders from Sub 136 to DHS	Extend Feeder # 15192, 15193, 15194, &15195 cables into the St. Elizabeth's Campus from Alabama Ave substation. These feeders will provide feeder capacity to the entire complex and will support future load growth.	$910,617	$618,410	$0	$0	$0	$0	$0
	UDLPLBN1	Benning Sub 7: Extend Two 13kV UG Dist Fdrs	Extend 2 13kV Benning Sub. 7 UG feeders from Sub.7 to the Benning Road and 15th St., NE area including half loops to transfer approximately 8.0 MVA of summer 2014 load from Benning Sub. 7 Feeders 14712, 14713, 15703 & 15708. Build a conduit bank as necessary and install approximately 4,000 feet of 600 MCM cable and 4 underground 3-way switches. Feeder extension required to relieve projected overload and to provide increased feeder capacity in the area.	$9,584	$0	$1,973,043	$386,711	$267,959	$410,100	$143,536
	UDLPLFL1	Florida Ave Sub 10: Ext 69kv to New T4	Install 69kv 1500kcm pipe-type cable circuit for 2.41 miles from New Jersey Avenue Sub 161 to Florida Avenue Sub 10 to supply fourth 69/13kv transformer.	$277,580	$106,334	$4,479,381	$5,353,829	$750,000	$993,714	$0
	UDLPLFL2	Florida Ave Sub 10: New High Voltage Grp xfer from 12th & Irving	Extend a new High Voltage Group (Feeders 15771,15772,15773, 15774,15775,and 15776) from Florida Ave. Sub. 10 approximately 0.1 miles from Barry Place and Georgia Ave. NE. & .09 miles from Bryant St. and Georgia Ave. to First St. and Michigan Ave. NE.,and rearrange with 12th and Irving sub 133 west High Voltage Group Feeders 14025,14026, 14027, 14028, 14029, and 14030. Model with UDLPLFL1 & UDSPLFL1.	$5,996	$0	$2,769,684	$8,654,221	$1,161,361	$1,997,300	$0
	UDLPLIRV1	12th & Irving Sub. 133 - Transfer West H. T. Group Load to Sub. 10	Extend a new H. V. Group from Florida Ave. Sub. 10 approximately 0.1 miles from Barry Place and Georgia Ave. to Bryant St. and Georgia Ave. NE, & 0.9 miles from Bryant St. and Georgia Ave. to 1st St. and Michigan Ave. NE., and rearrange with 12th & Irving Sub. 133 West H. T. Group Feeders 14025, 14026, 14027, 14028, 14029, and 14030. Model with UDLPLFL1 & UDSPLFL1.	$0	$0	$5,396	$41,575	$400,000	$469,672	$144,037

Load Growth (con't)	UDLPLIST1	I STREET SUB 197 - EXTEND NEW 13KV FEEDER	Extend new feeder out of Sub 197 to improve reliability and to provide load transfer capabilities in the area.	$776,562	$145,369	$0	$0	$1,000,000	$0	$10,131
	UDLPLLF1	Little Falls Sub. 77 - Extend New Dist. Feeder (UDLPLLF1)	The purpose of this project is to extend one outgoing 13.8kV Distribution feeder from Little Falls Sub. 77 along Loughboro Rd., north on Dalecarlia Pkwy, south on Rockwood Pkwy until Tilden St., and north on Tilden St. until Fordham Rd. underground a total distance of about 0.9 miles. Then, extend overhead from Fordham Rd & Tilden St. north on Fordham Rd. a total distance of approximately 0.1 mile. This feeder will be used to relieve Little Falls Sub. 77 Feeder 14766. Model with Term for new Little Falls Sub. 77 feeder project.	$0	$0	$0	$0	$2,106,836	$0	$0
	UDLPLM7W	Dist Feeder Load Relief - DC	1). Balance phase loadings on Twining City Sub. 150 – 4kV Feeder 345. 2). Rearrange 12th & Irving Sub. 133 Feeders 14007, 14014, and 14015. 3). Install two 3-way switches in Harrison Sub. 38 13kV Feeders 14894 & 15930. 4). Balance I St. Sub. 197 Central LVAC group. 5). Install one (1) 300kVAr capacitor bank on Nebraska Sub. 92 – 4kV Feeder 117. 6). Rearrange capacitor banks on various 4 kV feeders to maintain voltages within required limits. 7). Install one (1) normally closed switch in Feeder 292 (Wesley Sub. 61 & MacArthur Blvd. Sub. 152). 8). Remove one (1) set of 3-175 kVA + 5% voltage regulators in Fort Slocum Sub. 190 – 13kV Feeder 15012 located on 4th Street north of Emerson Street, NW and install one (1) set of 3-250 kVA + 5% voltage regulators in Feeder 15012 in the vicinity of 4th & Buchanan Streets, NW.	$2,941,010	$2,176,822	$7,668,357	$3,449,376	$2,678,723	$4,131,073	$9,482
	UDLPLNE1	Northeast Sub: New Supply 3rd Transf	Install 20,500 circuit feet of 69kv 1250kcm EPR cable from Benning Station A to Northeast Sub 212 to supply the 3rd 56 MVA 69/13kv transformer. Install one 9 MVAR bus capacitor.	$4,740,926	$3,069,294	$0	$4,379	$0	$0	$0
	UDLPLNE2	Northeast: Construct Supply for 4th Transf	Install 20,500 circuit feet of 69kv 1250kcm EPR cable from Benning Station A to Northeast Sub 212 to supply the 4th 56 MVA 69/13kv transformer. Expenses are for the start of engineering to support the installation of the fourth supply and transformer.	$633,436	$166,292	$860,435	$4,852,601	$1,708,223	$3,847,619	$358,507
	UDLPLNE3	NE Sub: Extend New LVAC Group to Sub 7	Extend a new 6 Feeder - 13kV LVAC Network Group from NE Sub. 212. Build an 8-way conduit bank from NE Sub. 212 along New York Avenue and N. Capitol St. NE for approximately 3,000 feet and on 3rd St., NE for approximately 1,500 feet. Approximately 18,000 feet of new 600 3/c MCM and 9,000 feet of new 500 3/c cable will be installed. This will allow for transfer of approximately 40.0 MVA of summer 2012 load from Benning Sub. 7 to NE Sub. 212.	$2,250,250	$3,257,149	$0	$241,239	$0	$0	$0
	UDLPLNE4	NE Sub New HV Grp, Transfer HV Load fm Sub. 117 to Sub. 161 to Sub. 212 (UDLPLNE4)	The purpose of this project is to extend the Northeast Sub. 212 Southeast Spot Network Group south along North Capitol St from H St to Mass Ave using approximately 1100' of new conduit and 6600' of new cable to transfer load from the Sub. 161 South Group.	$0	$0	$0	$0	$15,000	$0	$0
	UDLPLNE5	Sub. 52 to Sub. 212 Network Cutover	Extend a new (2nd) six feeder LVAC group from Northeast Sub. 212 west along Harry Thomas Way and Q St, south along North Capitol St and west along N St to 6th St using approximately 7000' of new conduit and 42000' of new cable to transfer all load from the Sub. 52 North LVAC Group.	$7,302	$0	$0	$0	$6,937,906	$0	$4,931,953

Load Growth (con't)	UDLPLNE6	NE Sub: New LVAC Grp Transfer LVAC from NE Sub to SE	Extend a new South Spot Network Group from Northeast Sub. 212 and rearrange with the Northeast Sub. 212 Southeast Spot Network Group and the Northeast Sub. 212 Southwest Low Voltage AC Network Group by extending underground six new feeders from Sub. 212, north on Eckington Pl, west on R St. until North Capitol St., and south on north capitol St. until M St. NE a total distance of approximately 1.1 miles.	$0	$0	$5,753,667	$27,685	$7,029,086	$5,020,248	$2,036,427
	UDLPLNW1	Harrison: Convert 3-4kv Fdrs & Reconf Fdrs	Convert load from portions of North Capitol Sub. 40 – 4kV Feeders 482 and 485 along 4th Street, NW between Buchanan and Hamilton Streets, NW to Fort Slocum Sub. 190 -13kV Feeders 15006, 15012 and 15015. The total amount to be converted from 4kV to 13kV is approximately 15,900 feet.	$0	$705	$5,715,059	$7,373,386	$5,233,789	$6,584,281	$0
	UDLPLNW3	New NW Sub: Extend New Dist Fdrs to 38 (UDLPLNW3)	The purpose of this project isto extend 17 -13.8kV underground feeder supplies a total distance of 1/4 mile, and rearrange with each of the existing Harrison Sub. 38 Distribution feeders. Build 4 -8W duct banks from new Northwest Sub. a total distance of approximately 1/4 mile. Model with new Northwest 138/13kV Sub. Model with UDSPLNW2, UTLPLNW1, UDSPLNW3 AND UDLPLNW1.	$0	$0	$0	$0	$10,000	$10,985	$3,254,809
	UDLPLWF1	SE:Sub136: Extend 7 Fdrs to Retire Anacostia	This project will require the extension of two overhead distribution feeders from Alabama Ave. Sub. 136, which along with existing feeders will be used to transfer all distribution load from Anacostia Sub. 8. Three new 13 kV feeders are to be extended to transfer the supplies of Twining City Sub. 50 from Sub. 8 to Sub. 136. Two new spot network feeders would be extended to transfer the spot network load from Sub. 8 to Sub. 136. The three feeders and the two spot network would be extended underground in new 8-way conduit from Sub. 136 to Sub. 8 to cut over the five Anacostia feeders, a distance of approximately 9500 feet.	$2,088,159	$2,685,701	$487,578	$832	$16,000	$4,495	$5,010,836
	UDLPLWF2	SE: Anacostia: 23rd St - 4 to 13kv Convert	Convert Feeders 331, 332, 335 & 353 to Sub. 8 Fdrs 14700 & 14703 & Sub. 136 Feeder 15173 per System Planning recommendations 05-02-01.1, 02.1 & 05-05-01.1. This will be converting 21,000 circuit feet of overhead 4 kV system.	$1,105,670	$967,218	$0	$236,589	$0	$2,011	$0
	UDLPLWF3	SE: Anacostia Sub : Convert 4 to 13kv & Retire Sub	The proposed 4 to 13kV conversions will be accomplished by extending and/or rearranging existing or new 13kV distribution feeders from Alabama Avenue Sub. 136 and converting all feeders from Anacostia Sub. 8 4kV along with portions of feeders from Congress Heights Sub. 64, Fort Carroll Sub. 130 and Twining city Sub. 150. This will require converting approximately 141,900 circuit feet of overhead. Anacostia Sub. 8 18,900 feet, Congress Heights Sub. 64 18,300 feet, Fort Carroll Sub. 130 60,200 feet, and Twining City Sub. 150 44,500 feet of overhead circuit. Conversion of 4 kV load out of Anacostia substation will allow the retirement of the station, which other wise would have to be rebuilt.	$1,514,793	$2,670,543	$495,259	$286,619	$16,632	$34,188	$0
	UDLPLWF4	SE: Waterfront Sub: Construct New LVAC Groups (UDLPLWF4)	The purpose of this projects is to extend 6 -13kV underground feeder group from the new Waterfront Sub. 223 to cutover Buzzard Pt. Sta. B - East LVAC group. Build approximately 0.4 miles of a new 8 way conduit bank and install approximately 2.4 miles of 600 MCM 3/c cable. Model with UDSPLWF1 138/13kV Waterfront Sub. 223 and UTLPLWF1 Waterfront Sub. 223 -new 138kV supply feeders.	$0	$0	$0	$0	$5,353	$0	$5,529,428

Load Growth (con't)	UDLPLM7W4	O St. Sub. 2 Feeder 14367 heavy-up	Heavy-up O Street Sub. 2 South LVAC Network Group Feeder 14367 from MH# 790389-349295 to MH# 790388-353765 from #2 3/C P.L. to 4/0 3/C P.L., requiring approximately 432' of cable.	$0	$0	$0	$0	$0	$706	$294,336
	UDLPLM7W8	Tenth St. Sub. 52 Feeder 15329 heavy-up	Heavy-up 10th Street Sub. 52 East LVAC Network Group Feeder 15329 from MH# 793388-058353 to MH# 792388-637360 from #2 3/C P.L. to 4/0 3/C P.L., requiring approximately 416' of cable.	$0	$0	$0	$0	$0	$11,578	$23,008
	UDSPRD9SWD	New Harvard - Purchase Property	Pucahse propety for Harvard Sub 13 expansion, located at 2914 Sherman Ave NW DC 20001. Propety will be used to stage temporary switchgears and transformers while Harvard is being rebuilt.	$0	$0	$0	$0	$0	$4,514,768	$0
	UDLPRM9BF	G St: Convert Fdr 209 to Fdr 15875	Extend and/or rearrange G Street Sub. 28 - 4kV Feeder 209 and SW Sub. 18 - 13kV Feeder 15875 to convert approximately 0.5 MVA of summer 2010 load from Feeder 209 to Feeder 15875. (Extend half-loop from the 8th St. & D St. S.E. intersection to convert lo 15875).	$0	$0	$0	$0	$0	$0	$0
	UDLPRM9BG	Harrison-Van Ness:Convrt Fdr 413 to 13kV	Extend and/or rearrange 4kV Feeder 413 (Harrison Sub. 38-6 & Veazey East Sub. 90-E) and Van Ness Sub. 129 – 13kV Feeder 15945 in the vicinity of Wisconsin Avenue between Fessenden Street and Harrison Street, NW to transfer and convert approximately 0.4 MVA of load from Feeder 413 to Feeder 15945. The total amount of overhead line to be converted from 4kV to 13kV is approximately 1500 feet.	$634,113	$182,912	$46,611	$382,952	$0	$0	$0
	UDLPRM9BH	Harrison: Convert Fdr 416 to Van Ness Fdr 14135	Extend and/or rearrange 4kV Feeder 416 (Harrison Sub. 38-5 & Quesada Sub. 89) and Van Ness Sub. 129 – 13kV Feeder 14135 to convert approximately 0.4 MVA of summer 2010 load from Feeder 416 to Feeder 14135.	$0	$236,385	$0	$0	$0	$0	$0
	UDLPRM9BJ	Twining City Sub: Convert Fdr 494 to Anacostia 14702	Convert approximately 0.5 MVA of load from Twining City Sub. 150 – 4kV Feeder 494 to Anacostia Sub. 8 – 13kV Feeder 14702. (Naylor Street) .	$0	$0	$0	$0	$0	$0	$0
	UDLPRM9BK	Harrison-Van Ness:Convrt Fdr 128 to 13kV	Extend and/or rearrange 4kV Feeder 128 (Veazey East Sub. 90-E & Oliver Street Sub. 146) and Van Ness Sub. 129 – 13kV Feeder 15947 in the vicinity of 41st Street between Chesapeake Street and Davenport Street, NW to convert approximately 0.5 MVA of load from Feeder 128 to Feeder 15947. The total amount of overhead line to be converted from 4kV to 13kV is approximately 950 feet.	$502,743	$1,243	$186,444	$113,195	$0	$0	$0
	UDSPLFL1	Florida Ave: Install 4th 69/13kv, 56 MVA Tr	Purchase 69/13kV 56 MVA Spare Transformer to replace transformer #4 at Florida Ave. Sub. 10. Also, install 9 MVAr at Florida Ave. Sub. 10. Connecting this transformer will assist in supplying load growth in the Downtown DC Area. Now combined with UDLPLFL2 - 12th & Irving Sub. 133 - Transfer HT Group to Sub. 10. Now combined with UDLPLFL1 - Extend 69kV Supply to Sub. 10 - 4th Transformer.	$8,434	$0	$1,589,683	$1,470,144	$929,436	$2,723,770	$0
	UDSPLM78A	Northeast Sub: Install 3rd Transformer & Cap Bank	Install 3rd 56 MVA, 69/13.8 kV Transformer at Northeast Sub 212. Install one 9 MVAR bus capacitor. Terminal costs at Benning Sta A for supply to third transformer.	$1,219,196	$1,301,715	$0	$30,438	$0	$0	$0
	UDSPLM79C	New Jersey Ave Sub (161): New Fdr Terminal	Install one 69kV breaker feeder terminal and associated relays.	$0	$0	$431,950	$243,067	$469,317	$203,875	$0

Work Breakdown Structure - 2015 Projects

REP Section	WBS Element	WBS Element Description	WBS Detailed Description	2012 Budget	2012 Actual	2013 Budget	2013 Actuals	2014 Budget	2014 Actuals	2015 Budget
Load Growth (con't)	UDSPLM7W	Dist Fdr Load Relief: DC Sub Work	Benning Sub. 7: Extend 2 new Dist. Feeders by 2014 Alabama Ave. Sub. 136: Extend 5 new Dist. Feeders by 2014 Champlain Sub. 25: Extend 2 new Dist. Feeder by 2015 Alabama Ave. Sub. 136: Extend Fdrs. 15173, 15175, 15176, & 15177 by 2015 New Northwest Sub.: Extend 5 new Dist. Feeder by 2015 Ft. Slocum Sub. 190: Extend one new Dist. Feeder by 2016.	$371,101	$408,994	$185,169	$338,438	$200,000	$561,297	$299,950
	UDSPLMV2	New Mt Vernon Sq Sub: Purchase Land (UDSPLMV2)	The purpose of this project is to Buy land for New Mt. Vernon Square 138/13.8 kV Substation. Model with UDSPLMV1, UTLPLMV1, UDSPLMV3 AND UDLPLMV1.	$0	$0	$0	$0	$30,517,504	$58,638	$17,618,566
	UDSPLNE2	Northeast Sub : Add 4th Transformer	Install 4th 69/13.8 kV Transformer at Northeast Sub 212. Install one 9 MVAR cap bank on the 13.8 kV bus. Terminal costs at Benning Sta A for 69 kV supply to fourth transformer.	$1,296,678	$0	$710,038	$4,359	$2,608,460	$1,302,169	$971,581
	UDSPLNE3	Benning 69kv Sub: Term for 3rd NE Fdr	Build terminal for new 69kV feeder to supply 3rd 56 MVA, 69/13.8 kV Transformer at Northeast Sub 212. Tap existing 69kV Gas Circuit Breaker 18B at Benning S-41and install new protective relays. After the retirement of the Benning generation scheduled in June 2012, remove 18B breaker and associated isolating disconnect switches in addition to the 69kV bus disconnect switch and add a new 69kV motor operated bus disconnect switch with bus work modifications in the Fall of 2012.	$327,519	$525,676	$0	$0	$0	$0	$0
	UDSPLNE4	Benning 69kv Sub: Term for 4th NE Fdr (UDSPLNE4)	The purpose of this project is ND21 - Benning 69kV Sub Terminal for 4th NE Feeder Install 69kV terminal at Benning to extend 69kV feeder to 4th 69/13.8 kV Transformer at Northeast Sub 212. Model UDSPLNE2, UDLPLNE2, and UDLPLNE5.	$0	$0	$0	$0	$416,615	$34,477	$334,333
	UDSPLNW2	New NW Sub: Construct New Sub	Start of engineering for a new substation named Northwest Substation. This station is neededto replace the existing Harrison Substation due to the condition of the existing switchgear and transformers. In addition this new station will support the continued growth in the upper nothwest portion of the District of Columbia. This work will establish a new 138/13.8 kV substation. Extend seventeen (17) feeders from Northwest Sub. 228, and tie them to the existing feeders coming from Harrison Sub. 38.	$646,781	$298,079	$334,035	$644,419	$9,763,691	$2,439,540	$13,215,151
	UDSPLNW3	Oliver St. Sub 146:Install 34/4kv Transf	This work is necessary to retire Harrison Sub. 38-5 and Harrison Sub. 38-6 in advance of the construction of new Northwest Sub. 228.	$0	$379,823	$703,476	$115,997	$637,792	$460,803	$27,247
	UDSPLWF1	SE: Waterfront: Establish New Substation	Start of engineering for a new substation in the Buzzard Point area of the system. Substation needs to supply increased capacity to the southwest portion of the city and support current and increased load growth in that area.	$172,619	$168,998	$523,694	$554,300	$836,377	$1,479,988	$9,270,819

Section	WBS Element	WBS Element Description	WBS Detailed Description	2012 Budget	2012 Actual	2013 Budget	2013 Actuals	2014 Budget	2014 Actuals	2015 Budget
Non-REP (con't)	UDLPRM5SD	Emergency restoration secondary cable in duct	Install/replace mainline secondary cable, mainline single phase cable, secondary neutral cable, non-lead secondary cable and three phase mainline cable.	$2,688,771	$2,905,978	$2,598,201	2,118,627	2,600,963	2,434,963	2,431,615
	UDLPRM5SG	Repl 69kV Slf-Containd UG Supl-Georgetwn,"F" St, 22nd St Subs	The 69 kV loop project will connect Takoma to Georgetown via 22nd Street Sub and F Street Sub. There will be four 69 kV solid dielectric feeders connecting Takoma Sub to 22nd Street Sub. Three of these solid dielectric feeders will continue on to F Street sub and terminate at Georgetown substation. One of the feeders will leave 22nd Street sub and travel directly to Georgetown substation. The last phase of the project will include a reconductoring of 3 exisiting pipe type feeders from Takoma to Champlain. These feeder will be tapped into before they enter Champlain and will travel to L Street substation.	$0	$0	$0	$0	$0	233,659	$0
	UDLPRM8BB	Blue Plains 69kV Feed NRL - Station C	Extend two 69 kV feeders from Blue Plains Sub. 83 to NRL Sub. 168 in order to serve as backup supply feeders to NRL Sub. 168.	$4,057,865	$165,310	$7,482,546	860,818	7,232,547	2,450,321	$0
	UDLPRM9PD	Pepco DC: Upgrade Pumping Plants	Replace obsolete pumping plants. Vendors supply, remove and dispose of old plant then install new plants and then bring new plant on line and provide training for PEPCO personnel.	$567,214	$0	$608,535	1,251,598	50,000	325,033	270,707
	UDLPRM9SC	Spare 1500KCMil Pipe Type Cable@Benn	Purchase spare 1500 KCMil pipe type cable used in 69 kV and 138 kV substation supply circuits.	$0	$0	$1,622,457	1,306,980	$0	$0	$0
	UDLPRPLIC	PILC REPLACEMENT PLANNED (UDLPRPLIC)	Replace approximately 4-5 miles per year of paper lead insulated cable with EPR. Replacement targets determined by PILC replacement strategy. Detailed scopes for planned improvements will be developed and subsequent scope descriptions added to program description.	$0	$0	$0	$0	$0	131,047	2,292,295
	UDSPCPA1	Potomac Annex: Replace 13/4 kv Xfrm	Project is needed to replace aging infrastructure and reduce risk to reliability for the Potomac Annex campus.	$31,760	$48,600	$412,890	19,990	100,000	$0	$0
	UDSPPBB1	Benning: Add 3rd 230/69kv Xfrm	At Benning 69kV Sub. 41 switchyard, the removal of two (2) 69/115kV transformers #4 & #7, the addition of a new 230/69kV, 224MVA transformer #11 and associated disconnects, CCVT's, surge arresters, H-Frame, and transmission pole. This transformer will be supplied from existing 230kV AIS bay #3 of Sub. 7. In addition, removal of one (1) 69/13kV transformer and one (1) 13/34kV transformer behind the generation plant. These two transformers will be replaced with one 69/34kV, 26.5MVA transformer installed at Sub. 41 and supplied from 69kV ring bus at Sub. 41.	$3,841,090	$6,893,113	$125,278	418,656	$0	$0	$0
	UDSPPBB2	Benning: Install 2-50MVAR 69kv Cap Banks	Install two (2) 50 MVAR, 69kV Capacitor Banks with associated current limiting reactors, disconnect switches, breakers, and relays at Benning 69kV Sub 41.	$1,729,247	$2,139,310	$1,110,910	1,679,089	$0	$0	$0

	UDSPRD8AD	Planned Dist Sub Impvt: Pepco DC	Foundation and building repairs required at Sub 190 Fort Slocum, presumably from earthquake damage in 2011.	$34,283	$30,070	$73,708	68,776	72,852	6,941	131,627
	UDSPRD8C1	Sta A & C Replace 69 kV Breakers (UDSPRD8C1)	Project Scope involves extending 69kV feeds from NRL and BluePlains and the installation of protective relays at both sites.	$0	$0	$0	$0	$0	677,849	116,448
	UDSPRD8C2	Subs 27 & 149 : Install 34.5kv Bkrs (UDSPRD8C2)	Takoma Sub #27 - Replacing 4 Oil Circuit Breakers with vacuum breakers. Project Lanham Sub #149 - There will be no breaker change outs on this job for the substation.	$0	$0	$0	194,504	708,110	137,152	$0
	UDSPRD8D2	Pepco DC: Improve/Add Sub Enclosures	Address areas where transformer fire walls and ventilation systems need repair to protect the equipment.	$102,328	$0	$103,022	29,304	101,463	31,714	168,642
	UDSPRD8ED*	Battery & Charger Dist Subs: Pep DC	The existing batteries and chargers have been determined to be beyond their design life, or have been determined to be in failure mode due to testing and observation results. Battery systems across the Pepco system will be tested and visually inspected for condition and replaced accordingly to ensure reliable DC power systems in all Pepco stations. Chargers will be replaced as well as internal caps that have degraded over time.	$112,882	$271,700	$202,829	290,439	123,851	391,771	505,376
	UDSPRD8FD*	Dist Sub Bushing Repl: Pepco DC	Replace remaining U-Type bushings that are susceptible to an industry known problem for equipment failure. Test values of individual bushings will indicate the need for replacement. Bushings are tested at increased frequencies when power factors degrade and until these identified bushings can be replaced.	$94,323	$489,906	$131,364	70,274	136,191	136,927	149,594
	UDSPRD8FV*	Dist Sub Bushing Replacement: Pepco DC	The purpose of this projects is Replace U-Type bushings that are susceptible to an industry known problem for equipment failure. Test values of individualbushings will indicate the need for replacement. Bushings of this type will be tested across PEPCo's system.	$0	$0	$0	$0	63,955	$0	67,921
	UDSPRD8G1	Purchase Spare 13/4kv Transformer	Purchase and install ten 13/4kV and two 34/4kV transformers at ten locations. Purchase one 34/4kV and one 13/4kV spare transformer to support the replacement project.	$2,959,026	$1,169,919	$42,362	135,878	$0	$0	$0

Work Breakdown Structure - 2015 Projects

Section	WBS Element	WBS Element Description	WBS Detailed Description	2012 Budget	2012 Actual	2013 Budget	2013 Actuals	2014 Budget	2014 Actuals	2015 Budget
Non-REP (con't)	UDSPRD8G4	Sub 136: Spare Xfrm 230/13kv	Purchase three spare transformers. Two 56 MVA, 230/13.8kV transformers for Benning Sub 7 with June 2012 delivery and for Alabama Avenue Sub 136 with June 2014 delivery. One 50 MVA 115/34kV transformer for Lanham Sub 149 with June 2015 delivery.	$792,449	$1,078,578	$10,533	172	$0	$0	$0
	UDSPRD8GD*	Pepco DC Reg: Purchase Spare Transformer	This job includes progress payments and assembly of spare 65/13.8kV, 56MVA power transformer to be stored at Benning Sta. A. The spare transformer will be designed to fit the special conditions at Georgetown Sub. 12.	$1,285,250	$39,817	$847,009	1,041,938	$0	111,758	$0
	UDSPRD8H	4kV Substation Automation	Purchase and install transformer secondary, feeder and DRTU smart relays at identified 4kV substations to improve reliability and level of monitoring and control at 4kV stations.	$86,000	$8,864	$16,674	67,054	829,000	518,612	702,982
	UDSPRD8JD	Animal Guards in Dist Subs: Pepco DC	As a result of documented animal related outage within substations in Pepco in DC, this project will either install animal guards on identified vulnerable insulators and equipment or install the new vanquish animal fencing around the substation to entirely keep animals out. Size and cost are key factors when determining if a fence will be used. Two substations in scope for 2013 are Benning and Van Ness based on the history of animal outages at these two substations.	$0	$0	$153,011	7,740	151,640	271,706	216,831
	UDSPRD8KD	13kV Swgr Impvts and Additions: Pepco DC	This project is for the purchase and installation of replacement 13.8kV switchgear in DC substations. Existing deteriorated switchgear will be replaced based on priority list determined through 2011-2012 Kinectrics study. Proposed plan is to replace all bus sections at one substation per year over next 5 years.	$0	$0	$1,024,776	21,524	5,898,944	172,353	3,297,771
	UDSPRD8KFS	Install 69kV High Speed Ground Switch on T2 at Fort Slocum Sub 190 (UDSPRD8KFS)	Installation of a High Speed Ground Switch (HSGS) on TX2 at Fort Slocum. This is a result of the protection concern for Fort Slocum TX2 secondary faults being detected and cleared by the associated load stations of 69143, when 69053 is tied to 69143 for emergency load relief of the Metzerott subsystem	$0	$0	$0	$0	$0	22,266	$0
	UDSPRD8LD	Pepco DC: Substation Ventilation	To be defined when warm weather in the late spring to early summer 2013 begins.	$43,384	$75,095	$42,976	43,255	42,054	(14,091)	41,217
	UDSPRD8NMD	Pepco: Disturbance Monitoring Installation - DC (UDSPRD8NMD)	Installing Disturbance Monitoring Equipment & Sequential Event Recorders as a replacement of all existing Digital Fault Recorders, DFR Master Stations, Master Station software, GPS Sychronizationand associated communications. This equipment was originally installed in the mid-eighties and is approaching the end of its useful life.	$0	$0	$0	$0	771,483	$0	299,579
	UDSPRD8Q1*	Pepco - SPCC Dist BKR Change	The scope is to replace 4 to 5 69 kV SPCC Oil Circuit Breakers with Gas Circuit Breakers a year.	$1,158,179	$1,856,049	$342,348	994,997	$0	$0	$0
	UDSPRD8QD	SPCC Plan - Install Containmt - Pepco DC	In order to comply with federal environmental regulations, PEPCO must provide containment for all its oil filled equipment. If containment is not provided and a spill occurs, PEPCO will be held responsible for any oil that spills in/on public property. US Environmental Law Applicabilty: 40 Code of Federal Regulations 112 (40 CFR 112)	$212,266	$0	$170,893	$0	205,637	$0	220,694

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 4

QUESTION NO. 6

Referencing the testimony presented by Witness Cantler at page 8 regarding resiliency and ability to withstand and recover from deliberate attacks, accidents or naturally occurring events to the system infrastructure.

a. The testimony states that planning used by PECO includes a N-1 criteria for distribution, sub-transmission and transmission facilities. In addition to those criteria, provide all new criteria to be used by Pepco to meet the Company’s definition for resiliency that would influence the justification of a new capital project.

b. Provide a complete list of projects included in the MYP that are required for resiliency and identify the planning criteria which requires the investment for each.

c. Provide the most recent copy of Pepco’s Distribution Standards Guideline 1442.

RESPONSE:

a. The Company does not have any established new criteria. Per usual, all projects must meet the Company’s existing criteria. Please see the Company’s response provided in 4-6(b) for the types of projects that are initiated to support resiliency.

b. There is no established listing available. As discussed in the Direct Testimony of Company Witness Cantler (Question 10), the Company’s capital investment strategy during this MYP period (2023-2026) focuses on supporting a pathway to a climate ready grid through, amongst other things, improving grid resiliency. Improved grid resiliency is achieved by, but not limited to, projects initiated to replace aging and/or obsolete infrastructure and routinely and timely performing corrective maintenance work when and where necessary. As detailed in Exhibit PEPCO (H)-2, the Company provides all of its capital funded distribution construction projects, budgeted by year (including 2023) throughout the MYP, including the project’s scope and justification.

   Additionally, project work such as Advanced Distribution Management System Implementation (ITN: 61976, see pg. 174 of Exhibit Pepco H-2), 69kV Distribution Line Improvements (ITN: 70240, see pg. 192 of Exhibit Pepco H-2), 69kV Feeder Rebuild (ITNs: 70242, 70423, on pg. 192-193 of Exhibit Pepco H-2) Champlain Bypass (ITN: 73368 on pg. 193) have all been identified within the project, solutions, justification slides (PSJ) of Pepco (H)-2 as directly supporting grid resiliency of the Company’s distribution infrastructure.

c. Please refer to the attachment labeled: FC 1176 OPC DR 4-6c

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

1. Overview

This document provides an overall description and philosophy for the Pepco 13 KV distribution system, the design, circuit protection, major equipment, material, and operation. In DC and Maryland, Pepco operates a 4.16 and 13.2 KV 4-wire distribution system. A four-wire system is made up of three energized lines, phases A, B, and C, and a ground referenced neutral line resulting in a wye configuration that allows the system to serve both single phase and 3-phase loads. A four-wire system can maintain relatively balanced voltages on all 3-phases in the presence of minor current imbalances driven by serving both single and 3-phases loads on the same system. The voltages are stabilized by maintaining a robust neutral network that is interconnected between the primary and secondary neutrals with multiple grounding points that parallel the earth return path. Four grounds per mile are required as per Standard OH-6003 (1275) and OH-6002 (C-345).

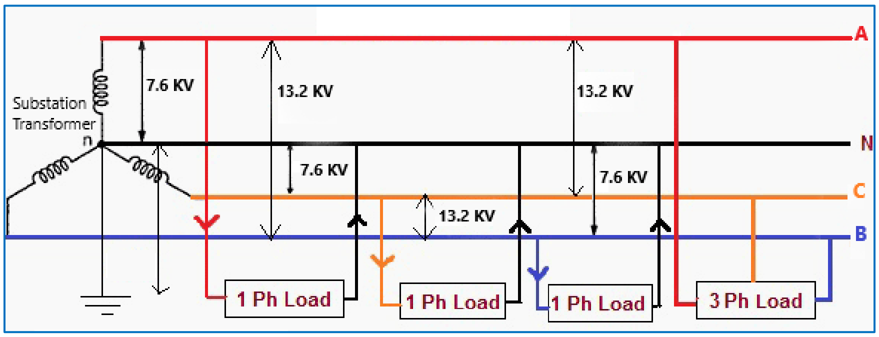

Figure 1: Simple Circuit Diagram of 13.2 KV 3-phase 4-Wire Distribution

1.1. Distribution Design

The overall health and reliability of the distribution system is designed by the Capacity Planning department. Their role is to periodically perform voltage and current analysis studies on the distribution system based on projected peak load forecasts to ensure that the system continues to provide reliable quality electric service to current and future customers. They also perform predictive analysis that includes the loss of a single primary circuit/feeder element in which the subsequent automatic or manual restoration must be accomplished within four load transfers. The goal of Capacity Planning as stated in their design criteria is to expand and upgrade the distribution system in an orderly and economic manner such that:

1. Adequate voltage can be maintained at the customer, typically within +/- 5% of nominal voltage, as directed by state regulations.
2. Applicable ratings of facilities will not be exceeded under normal and more probable contingency conditions.
3. Reasonably reliable system and customer end use service will be provided.
4. Adequate system reactive support is available.
5. As a general rule, a 13KV feeder can supply on average up to 8.5 MVA

Distribution Standards Guideline 1442

Load forecasting and predictive reliability analysis can generate construction recommendations that continually change the configuration of the distribution system. The local district engineering and operating centers often work in collaboration with Capacity Planning and Central Reliability Engineering to execute distribution system upgrades that are based on these studies. Local district engineering also performs small design changes to the distribution system that are driven by new customers and modifications of existing customer service, as well as, pockets of poor reliability performance.

In order to avoid subjecting customers' electronic equipment to over voltages during fault conditions, line to neutral connected single phase and wye-wye connected 3-phase transformers will only be used on four-wire feeders. For the same reason, line to line connected single phase and delta-wye connected 3-phase transformers will be used exclusively on three wire, commercial, and network feeders. Every reasonable effort is to be made to eliminate conflicts with these guidelines where they are found to exist.

2. Overhead Distribution

2.1. Overhead Design

Pepco uses aluminum conductor steel reinforced (ACSR) as the main primary conductor. 477 ACSR 18/1, 18 strand aluminum 1 strand steel, Pelican[1] is used with a 1/0 ACSR 6/1 Raven neutral for the main 3-phase of the feeder. If the available fault current is between 10 and 20 kA, then 4/0 ACSR Penguin is paired with the 477 ACSR Pelican. This is often the case as Pepco tends to experience high fault currents. In situations where fault current exceeds 20 kA, a 4/0 Cu 7 strand conductor is available for the neutral. 1/0 ACSR 6/1 Raven is used for single and multiple phase lines with lower ampacity requirements, Standard OH-6201 (0880) and Guideline 1500. The primary is constructed on a minimum 45ft class 2 (45/2) wood pole with 8 – 10ft fiberglass crossarms and polymer insulators, Standard OH-1300 (0587). Span lengths are usually less than 180ft. The single-phase primary is constructed on 45 ft class 2 (45/2) wood poles or larger with polymer ridge pin insulators. Span lengths are usually less than 180ft, each mile of line shall have at least 4 arrester and ground locations with a measured resistance less than 25 ohms.

The common overhead secondary main wire that runs from transformer pole to adjacent poles with multiple customers is 4/0 aluminum (AL) cross linked polyethylene (XLPE) triplex and 4/0 AL stacked bus. The overhead secondary service wire, often called service drop, that runs from service pole to customer point of attachment is usually #2, 1/0 or 4/0 AL XLPE triplex depending on loading requirements.

On substation cable getaways, load break gang operated cable equipment must be installed on or preferably within one span of the cable pole for isolating the underground cable portion of the feeder trunk. Load taps are not to be made from the underground

[1] In North American electrical conductors are given code names to aid identifying the different types and sizes of conductors. ACSR birds, AAC flowers and AAAC cities.

trunk between this sectionalizing equipment and the feeder breaker in the substation except through a four-way subway or pad mounted tap switch.

As the distribution feeder extends downstream from the substation to serve more load, the feeder trunk and branches are isolated using load break gang switches, automatic circuit reclosers (ACR), and fused cutouts. The end of each main feeder unfused trunk and branch is terminated at a normally open load break gang switch, SF6 switch or ACR to create a tie point to the neighboring feeder. This provides opportunity for one of the feeders to supply the other should the other experience a fault farther upstream. This segmentation can allow the fault to be isolated to a smaller section of the feeder so that the normally open tie point can be closed to restore the unaffected main trunk feeder segments.

The design goal for the distribution system is to maintain a system of feeders that operate at or below 600 amps building in reserve ampacity for emergency load transfers and reducing system losses. However, the distribution system is a constantly evolving system consisting of newer and legacy construction and design. The cost of a general system rebuild is prohibitive and therefore it is the policy that going forward, the approved Pepco mainline conductors are to be used in all new construction. Capacity Planning Regional Manager will approve any deviations. Furthermore, all design work involving adding additional conductor should be deadended on a structure such as a pole or crossarm, not spliced, to avoid adding points with a higher failure rate to the overhead system.

To avoid major feeder load imbalancing, single and two-phase lateral demand loads must not exceed 45 amperes (360 KVA) per phase. When such a condition cannot be relieved with load transfers, the second or third phase is to be added with the resulting unbalance split between the new phases. If the demand loads on a 3-phase lateral would exceed 100 amperes (800 KVA) on any one phase, a second lateral tap should be extended, or the overloaded tap should be reconductored to 477KCM ACSR and considered part of the main trunk of the feeder. Sectionalizing gang switches or a recloser should be installed in the new trunk branch at or near the branch point and backup should be provided at an open tie point to another feeder if possible.

Extensive use of backup feeder tie points through ACRs and sectionalizing load break gang switches (manually or motor operated) assist in emergency restoration and minimize the exposure of customers to long outages. Switching is performed live, where feeder phase angle differential is within Control Center prescribed boundaries, make before break, to prevent a momentary outage where phase angle difference is calculated to be small. Pepco is installing ACRs in place of select gang operated switches. Motor operated disconnects are being replaced or removed. Typically, reliability projects are being used to accomplish these system improvements.

Substations supplied from different sub-transmission networks experience a substantial difference in phase angle. The phase angle difference between a feeder from one substation and its backup tie feeder from another such substation can cause circulating current large enough to exceed the load break rating and safe close rating of the gang switches. For this reason, feeders supplied from substations supplied from different sub-transmission networks will not normally be tied live. These devices must be labeled as "Does not Phase", "Do not Tie or "Does not Tie" by System Operations and must be clearly marked for field crews.

Similarly, feeders from the same or different substations which employ a legacy unidirectional regulator, if tied, can experience circulating currents in excess of the regulator rating and voltages outside of the mandated voltage ranges. Unidirectional regulators are to be placed in the neutral position and the controls turned off prior to tying such feeders. Bi-directional voltage regulators will be installed for all new installations and replacements of existing aged or failed regulators.

2.2. Overhead Primary Conductor

2.2.1 Feeder Main 3-phase Primary Bare Conductor

The overhead primary conductor links the substation to the customer service transformers throughout the distribution system. These bare stranded conductors regularly operate at 13 KV. In 1982 Mashikian & Associates Consulting Engineers performed a study to determine the optimal 13 KV primary ACSR size conductor for Pepco's main 3-phase bare wire construction. They found that 477 KCMIL 18/1 ACSR Pelican was the most economical bare wire to install due to material availability and ampacity needs. ACSR was chosen over all aluminum conductor (AAC) and all aluminum alloy conductor (AAAC) because of its cost effectiveness, higher strength and ability to traverse longer spans without compromising sag clearance, whereas ACE and DPL mainly use AAC for its lightweight, high conductivity and anti-corrosion properties; especially in coastal areas. Pelican is rated in line with the emergency limit of much of the field equipment on the Pepco system. Table 1 shows the ratings of Pelican and Figure 2 shows an example of its appearance. Standard OH-6201 (0880) provides a listing of the various overhead conductor types.

477 PELICAN	SUMMER	WINTER
NORMAL	735 A	875 A
EMERGENCY	915 A	1035 A

Table 1: Ratings for Pelican 477 KCMIL 18/1 ACSR

Figure 2: Example of 477 Pelican

2.2.2 Primary Lateral Conductor

Pepco uses 1/0 AWG 6/1 Raven ACSR conductor for single phase and multiphase laterals with lower ampacity requirements. Radial 100 ampere laterals of one, two, or 3-phases are tapped from the feeder trunk through fused load break cutouts or a drop out recloser (Trip-Saver II). Some laterals may terminate at a solid blade load break cutout to provide a backup tie point whenever possible. This tie point must be a lateral from the same phase. Tying opposite phases is an unsafe practice and could result in a circuit outage. Therefore, the use of opposite phases at open tie points is strictly prohibited.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Table 2 and Figure 3: Example of 1/0 ACSR Raven provide the ratings and example for 1/0 AWG ACSR Raven.

NORMAL	265 A	315 A
EMERGENCY	325 A	365 A

Table 2: Ratings for Raven 1/0 AWG ACSR

Figure 3: Example of 1/0 ACSR Raven

2.2.3 Primary Neutral Conductor

4/0 AWG 6/1 Penguin ACSR (1650204) is the standard neutral paired with the 477 Pelican on the Pepco distribution system, due to the relatively high fault currents. This is used for its strength and thermal properties that enable the wire to withstand the maximum available feeder fault current. A 1/0 ACSR is available for areas with less than 10 kA of fault current and 4/0 Cu for areas exceeding 20 kA. The 1/0 ACSR is used as the main neutral for laterals since it may be required to carry full lateral load current. Table 3 provides the ratings for 4/0 AWG Penguin. Construction of 4/0 Penguin is similar to 1/0 Raven only larger. Standard OH-5002 (E-02) lists the ampacity for a wide array of overhead conductors.

4/0 Penguin	SUMMER	WINTER
NORMAL	400 A	480 A
EMERGENCY	485 A	550 A

Table 3: Ratings for Penguin 4/0 AWG 6/1 ACSR

2.2.4 Preassembled Aerial Cable

A 15 KV 500 KCMIL 3-1/C AL EPR preassembled aerial cable (PAC), can be used as the mainline conductor where transit will be made through dense trees, for the third and fourth circuits on a pole line that already contains two bare wire circuits, for high voltage customers who require two or more circuits installed on a common pole line, or overhead express feeders. The aerial cable has an equivalent 4/0 neutral and is fully shielded like underground cable and is not jacketed. PAC is intended for express run applications since adding splices to connect load will reduce the reliability of the cable. PAC should always make a transition to open wire through gang operated load break equipment, see Figure 6 of Standard OH-1603 (1460_G-630). #2 AWG CU PAC cable is also a common cable size used on the Pepco distribution system where ampacity needs are lower.

NORMAL	460 A	575 A
EMERGENCY	570 A	665 A

Table 4: Ratings for the 500 KCM PAC

2.2.5 Spacer Cable

Another primary conductor that is available for use on the Pepco distribution system is spacer cable. Spacer cable is intended to be used in similar situations as PAC cable with the added benefit of being able to serve transformers or tap off to laterals with less impact to the cable's performance and reliability. The spacer cable is a 477 KCMIL AAC 15 KV cable with a polyethylene covering. A 46 KV spacer that pairs with the 15 KV cable can be used to match the spacing of armless construction. Cover or coating on spacer cable is not for insulation of the conductor but to protect them from incidental contacts. It is constructed using diamond shaped plastic spacers giving it a low profile. The three energized conductors fit into the bottom and two side positions and the aluminum clad (AWA) messenger fits into the top spot. The AWA messenger provides strength to hold up the conductors and a mechanical shield to falling branches. A complete understanding and adherence to the manufacturer's directions is critical to a successful installation. The manufacturer's best practices will protect the cable insulation which is subject to damage by stray currents over time. Standard OH-1650 (1754) has notes detailing some installation instruction and best practices. The ratings are in Table 5 and Figure 7 shows an example of the installation.

477 Spacer Cable	SUMMER	WINTER
NORMAL	520 A	705 A
EMERGENCY	670 A	825 A

Table 5: Ratings for the 477 KCMIL Spacer Cable

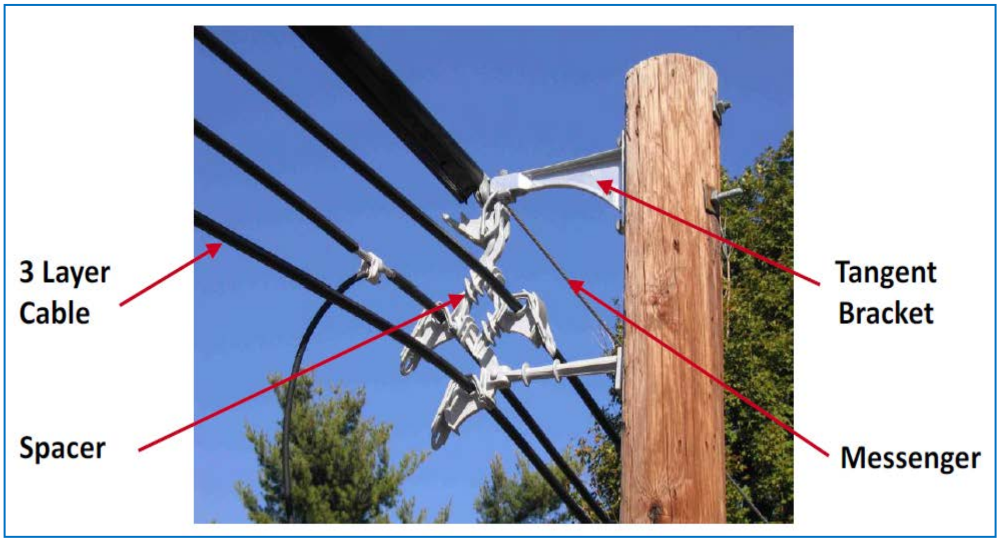

Figure 7: Example of Spacer Cable Installation

2.2.6 Tree Wire

Tree wire is another covered primary conductor option used to improve reliability in heavy tree areas. It is similar to spacer cable except that its construction resembles bare overhead conductor instead of the diamond compact shape of spacer cable. The covering on tree wire is also for mechanical protection and not for conductor insulation. Tree wire is available in 15 KV 1/0 6/1 ACSR, 4/0 6/1 ACSR, and 477 18/1 ACSR, see Standard OH-6201. Tree wire should be grounded a minimum of 6 times per mile, and it is very important that polymer type insulator pin (1652575) and appropriate covered tie wire are used during installation to provide a better dielectric match with the outer covering.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Figure 8: Example Tree Wire Installation

2.3. Overhead Secondary

The overhead secondary distribution system links the distribution transformers with the customer loads to serve them at their required voltage level commonly ranging from 120 V to 460 V. The secondary conductors run from the transformer to a distribution pole serving several customers and the secondary service wire runs from the pole to the point of attachment at the customer facility.

2.3.1 Secondary Main/Bus Line

The standard distribution secondary wire for single phase customers is 4/0 aluminum (AL) cross linked polyethylene (XLPE) triplex and 4/0 AL 6/1 stacked bus. It is used to transmit power from the distribution transformer to multiple customer loads where higher ampacity is needed, or for longer secondary runs between distribution poles when voltage drop, and flicker are a concern.

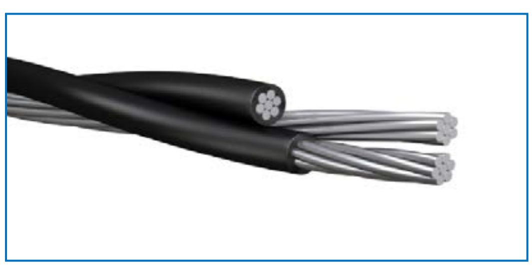

Figure 9: Example of 1/0 AWG Triplex

pepco
An Exelon Company

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

2.3.2 Secondary Service

The service wire is an extension of the secondary to the customer facility. It transmits the power from the distribution pole to the customer point of attachment. Depending on customer load, Pepco runs 4/0 AL triplex up to 50 ft, #2 AL triplex and 1/0 AL triplex up to 100 ft. Table 6 shows the rating for some common secondary conductors from Standard OH-5000 (1744_C501).

Conductor	CATID	Rating
#2 Al 2C W/ #4 NEU Triplex	1650142	150 A
1/0 Al 2-1/C W/ 1/0 NEU Triplex	1650139	200 A
4/0 Al 2-1/C W/ 4/0 NEU Triplex	1650138	310 A

Table 6: 1-Phase Secondary Ratings

2.3.3 3-phase Secondary

3-phase customers usually require higher ampacity. The 600 V 4/0 AWG AL 4-1C XLPE quadplex is one of the conductors used to serve these larger 3-phase customers.

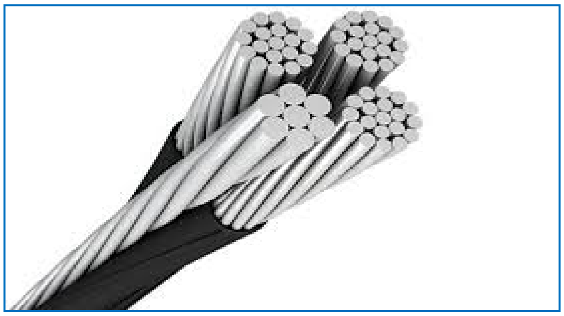

Figure 10: Example of 4/0 Quadplex

Conductor	CATID	Rating
4/0 3-1C W/ 4/0 NEU QUAD	1650140	280 A

Table 7: 4/0 AWG XLPE Quad Rating

2.4. Overhead Transformers

Transformers are used on the distribution system to convert power at primary voltage to secondary voltage for customer use. Pepco uses mineral oil-immersed self-cooled conventional type overhead transformers like the one shown in Figure 11 from Standard 0999. There are several different options that range from 25 to 167 KVA and secondary voltages from 120 to 265 V. One transformer can be installed on a distribution pole to serve single phase load or several can be installed on a cluster mounted bracket to provide 3-phase power in a 3-phase transformer bank. Larger loads are supplied from pad mounted or subsurface transformers of up to 2500 KVA capacity which are covered in the URD section.

An Exelon Company

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

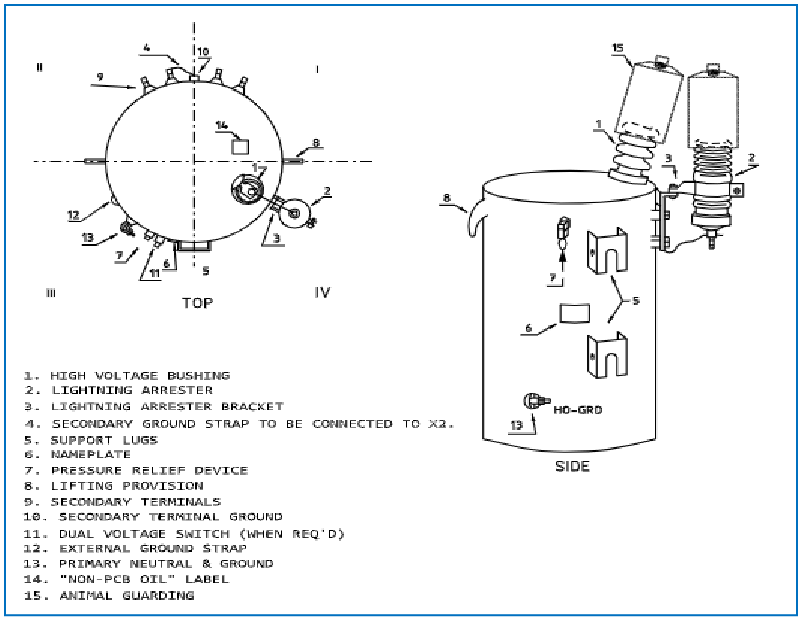

Figure 11: 1 Ph Overhead Transformer Example

2.4.1 1 Ph OH Transformers

Figure 12 from Standard OH-4401 (0598) shows an example of a 1 phase transformer installation and Figure 13 shows the connections from Standard OH-5501 (0584). Pepco uses 25, 50, 100, and 167 KVA overhead transformers to serve single phase and 3-phase loads. A ground strap connects X2 and X3 together and to the neutral creating a zero-reference point resulting in 120 V across X1-X3 and 120 V across X2-X4, 180 degrees out of phase with X1-X3 providing for 240 V across X1-X4. This gives single phase customers 120/240V service with two hot legs and a neutral. All new single-phase transformers are to be 50 KVA or higher and installed on 50 ft poles. 25 KVA transformers can be used for rear lot lines and rural, single customer, connections.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

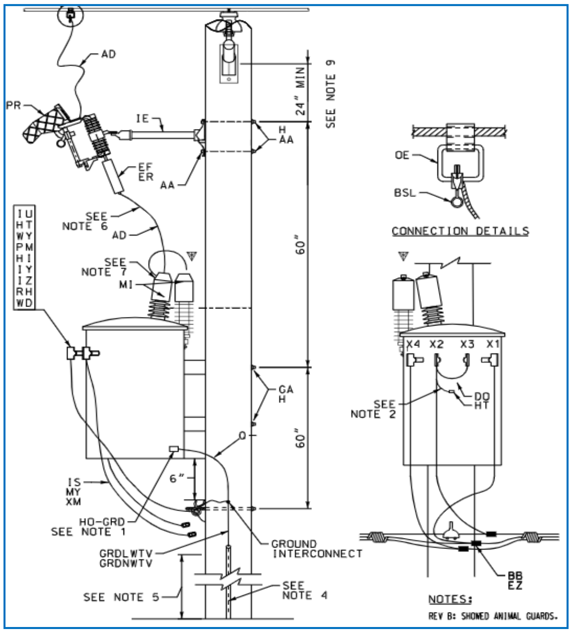

Figure 12: 1 Ph Transformer Installation Example

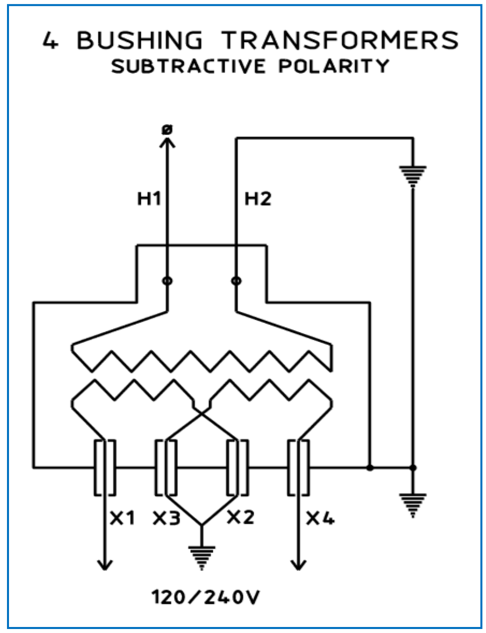

Figure 13: 1 Ph Single Bushing 4 Pole 120/240V Example

2.4.2 3 Ph OH Transformers

3-phase transformer banks range from 75 KVA to 500 KVA and are used to supply power to single and 3-phase loads. They can be configured in serval ways to meet different customer requirements. Some examples are 120/208 V wye-wye, 120/240 V open and closed delta, and 265/460 V wye-wye banks. The below figures show some construction and connection examples. When a customer has a mix of single and 3-phase loads, each transformer will be sized to handle the single-phase load connected to it and 1/3 of the total 3-phase load.

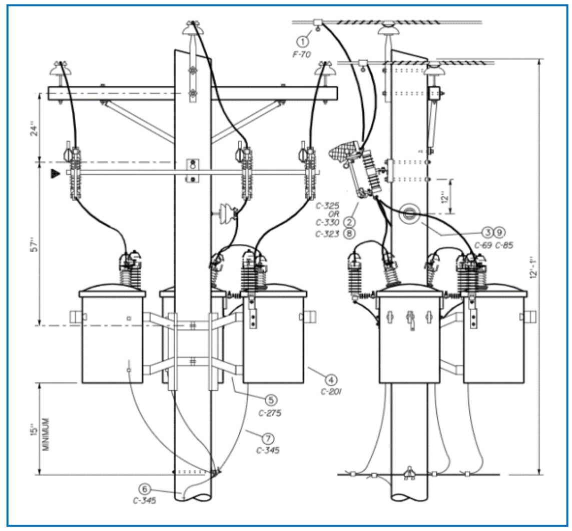

Figure 15: 3 Ph Bank Standard OH-4480 (L-80)

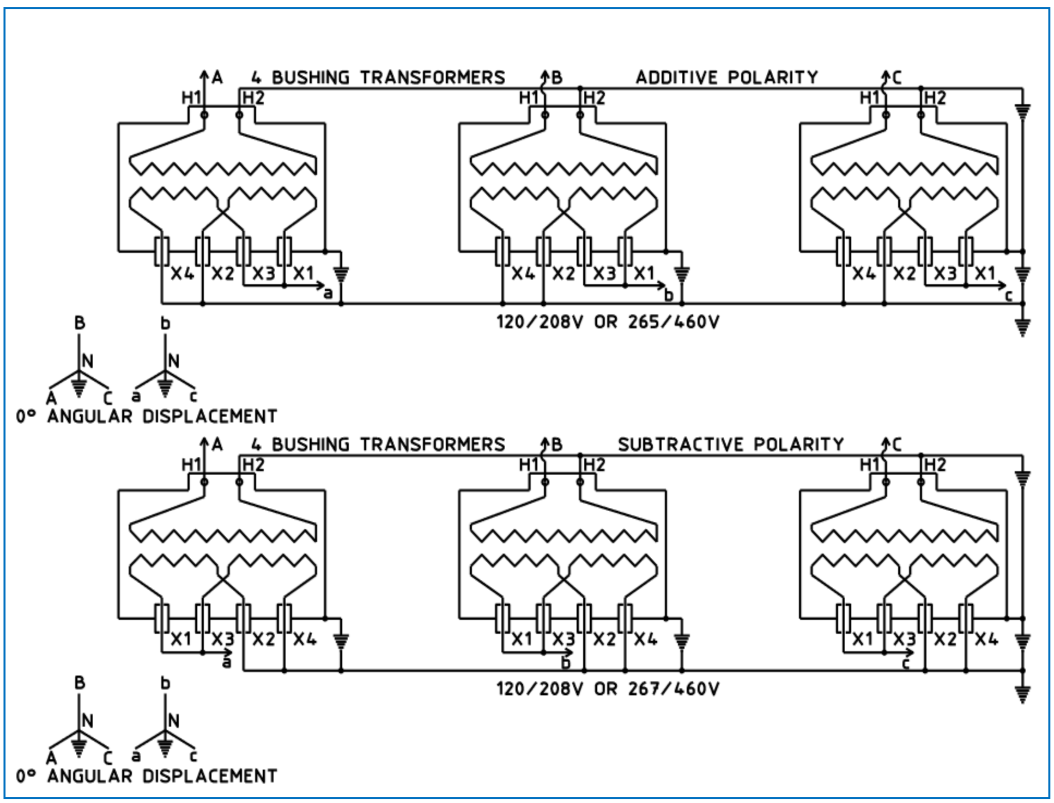

Figure 16: 3 Ph 120/208 V Wye-Wye Bank Example from Standard OH-5501 (0584)

2.4.3 Step Down Transformers

Step down transformers are used to step the primary voltage down to a lower primary voltage. The more common examples are stepping down 13.2 KV to 4.2 KV to serve a large customer or to provide power to an older 4.2 KV circuit or section of circuit that has not been converted to 13.2 KV.

2.5. Overhead Switches

Switches are used on the Pepco distribution system to provide a means to sectionalize and isolate different parts of the feeder. They give operations the flexibility to restore customers out of service by transferring them to another part of the feeder that is still energized or an adjacent feeder. Switches can also be used to transfer customers to reduce their exposure to the more sensitive maintenance mode of the breaker or hot line tag of the recloser should a contact cause a breaker or recloser to lockout.

2.5.1 Underarm Disconnect Switch

Pepco uses a 13 KV 600 A rated under arm disconnect switch on the 4 KV system. They are single unit manually operated switches. Figure 17 and Figure 18 from Standard OH-6905 (0594) show how the switches are installed.

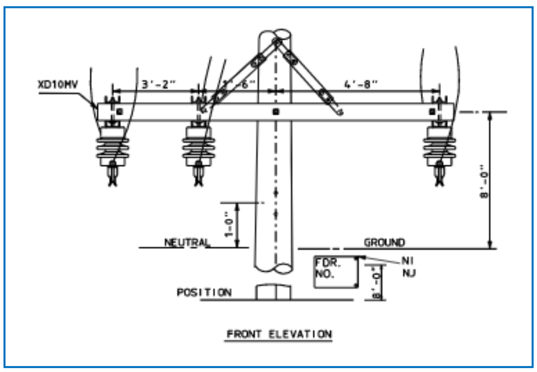

Figure 17: UAD Switch Front View

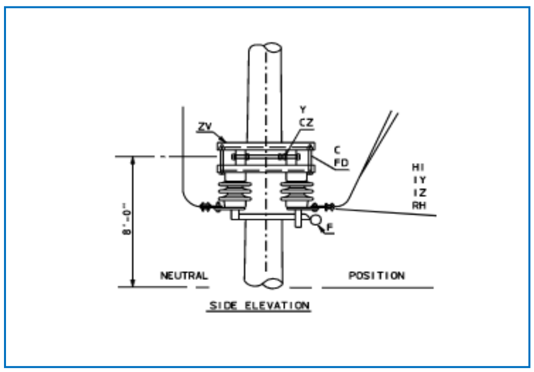

Figure 18: UAD Switch Side View

2.5.2 Gang Operated Switch

Gang operated switches operate all 3-phases simultaneously. This eliminates any current imbalances during switching that is experienced when switching with manually operated underarm disconnect switches. Figure 19 from Standard 0678 shows the installation of a gang operated crossarm mounted switch assembly.

Figure 20 shows an SF6 gang operated switch from Standard OH-4302 (1716_O-45). Refer to Standard OH-6901 (C-301) for a gang operated load break switch and Standard OH-4301 (O-35) for the horizontal (HOG) load break hook stick switch shown in Figure 22

2.6. Voltage Management

Distribution loads have an impact to the voltage profile of the circuit. Inductive loads like motors produce inductive reactance causing the current to lag the voltage. Loads far from the source experience lower voltages due to the power losses inherent in the conductor the current needs to traverse. Capacitor banks are used to provide capacitive reactance which counteracts the inductive reactance from the served load and brings the current more in phase with the voltage. They also raise voltage locally helping prop up the voltage in areas farther away from the substation. Voltage regulators can step the voltage up or down allowing the voltage to be controlled more precisely and are mainly used to support voltage where reactive support isn't needed. Surge arresters protect the circuit against voltage swells caused by lightning strikes, manual switching, faults, and other transient phenomena.

2.6.1 Capacitor Banks

Pole type capacitors are used for voltage support and system reactive correction. Figure 23 lists the available capacitor banks and their specifications. Banks are protected with three load break cutouts fused according to Figure 23. Capacitors may be fixed or switchable. Fixed banks are either on or off and need a local technician to physically open and close the bank. Switchable banks have a local controller that can be set to voltage, VAR, temperature, and time modes and will automatically turn the bank on or off as conditions change. A radio can be installed, and the bank can be tied into the SCADA system so that the bank can be operated remotely. See PHI Spec 1600 and the various construction standards available. See Standard OH-4250 for capacitor controls. Figure 24 shows an example of a capacitor bank installation.

2.6.2 Voltage Regulators

Single phase bi-directional voltage regulators of 50, 167, and 250 KVA are available for voltage correction, Standard OH-6101 (C-225). Bi-directional regulators do not need to be placed in the neutral position prior to switching like uni-directional regulators. The maximum size was increased to 250 KVA to more nearly match the main feeder trunk capacity when set for five percent regulation. Regulator controls are available with or without battery backup. See Tech News 2015-10, PHI Spec 1469, and Standard OH-4151 (0884_L-107). 3 phase loads should be installed either upstream or downstream of a set of regulators but never in between regulators of the same set. This is so that all phase voltages are similar at the customer's service. Where distributed generation is installed on the circuit special control parameters maybe required that could require replacement of existing regulators with more modern devices with the proper control packages. Regulator sizes up to 250 KVA can be installed on their own pole. Larger regulators should be installed on a platform, Standard OH-4152 (L-108). Two regulators up to 167 KVA can be installed on the same pole. Figure 25 from Standard 1363 provides an example of a voltage regulator and Figure 27 and Figure 28 show some methods of construction.

2.6.3 Surge Arresters

Pepco follows industry best practice of installing surge arresters to protect all installed equipment and open points. Example locations are at dead ends, on both sides of switches, capacitor banks, risers, poles adjacent to risers, reclosers, transformers, midpoints, and at open points in pad mounted equipment. Overhead arrester stations must be provided approximately every 600 feet as per Distribution Standards best practice (See Tech News 2004-06). All new overhead arrestors on the 13 KV distribution system are metal oxide varistors (MOV) heady duty class 10 KV MCOV arresters, Standard OH-6002 (C-340). Pole mounted transformers come with arresters pre-installed. For other overhead installations like switches arrestors are provided as an individual stock item (1650861), see Figure 29.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Figure 30: OH Distribution Class Arrester

2.7. Overhead Protection Equipment

2.7.1 Distribution Circuit Breaker

The Pepco 4-wire distribution system feeders use a feeder circuit breaker located at the substation to protect the substation bus from distribution faults. They use a combination of instantaneous and time current relays that sense feeder phase and ground current and trip at a desired overcurrent value. A high-set instantaneous and time-delayed protection scheme is used at the main feeder breaker for fault protection and programmed to automatically reclose in most cases to restore service to customers should the fault be temporary in nature. Pepco does not use the low set instantaneous setting usually used in a fuse saving philosophy. Instead, the time-delayed setting is used preventing the breaker from tripping for faults downstream fuses and avoiding momentarily interrupting all customers on the feeder. The time-delayed reclosing relay will initiate up to a total of 3 reclose operations. Pepco's fuse blowing philosophy is mainly driven by the fact that the Pepco distribution system has very high fault currents making it difficult to save even the highest size fuses from being damaged or completely melted in the time it takes for the low set instantaneous to operate. The low set instantaneous can be manually enabled by the OCC when needed. It is always enabled during maintenance mode (MM) for worker safety. When in maintenance mode, reclosing will be disabled if tripping occurs. The high set instantaneous protection operates only for very high magnitude faults close to the substation to prevent damaging substation equipment.

2.7.2 Reclosers

Automatic circuit reclosers (ACRs) are pole mounted protective devices that are similar to feeder circuit breakers in that they have the capability to detect faults, trip and reclose a set number of times. Unlike breakers, the newer microprocessor controlled reclosers have more coordination setting options and may trip and lockout single phase. Reclosers provide segmentation of the main feeder trunk like switches with the ability to have protection settings, remote control and reclosing like breakers. Pepco is moving towards a fuse blowing philosophy for recloser protection so downstream fuses will clear faults before the recloser operates. A fuse saving philosophy has one or more trip settings set to operate faster than certain fuse sizes to provide an opportunity to save the fuse in case the fault downstream the fuse is temporary in nature. The downside is increased momentary interruptions for customers downstream the operating recloser.

An Exelon Company

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

The state-of-the art, electronic, 3-phase units may be utilized in complex distribution automation schemes and may be remotely controlled by system operators. A 3-phase 800 continuous amp, 12.5 and 16 KA interruption rated triple single ACR is available for the Pepco distribution system, see Standard OH-6301 (C-310).

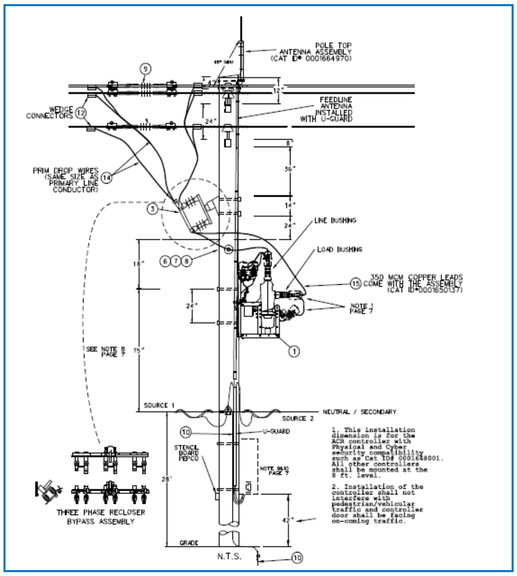

Figure 31: Viper Recloser Standard OH-4004 (1715_O-38)

Figure 32: Viper Recloser

Placement of ACRs should be recommended by Capacity Planning with concurrence by System Protection and Regional Reliability. Fault currents near Pepco substations often exceed ACR ratings and multiple ACRs placed in series can lead to coordination difficulties. Placing them in sectionalizing or switch mode can help solve some of these problems. See PHI Specification 1727 and Standard OH-4004 (1715_O-38) for more information. Additionally, Recloser Guideline 1731 provides more information on reclosers like that shown in Figure 32.

2.7.3 Single Phase Reclosers

Single unit reclosing devices like the Trip Saver II (Drop Out Recloser) are available to provide similar functionality as the three phase reclosers for single and multi-phase applications. The vacuum interrupting reclosers are mounted into a custom cutout and have a load rating of 100 A with the ability to operate at higher load currents for short durations. They can be programmed with an array of protection settings with the most widely used settings mimicking an N type fuse. They have a display screen capable of displaying a wide range of parameters like the number of times tripped, contact life remaining, and fault and load current. Units are available rated for 12 and 25 KV, see Standard OH-6903 (1069_C-306) for details. When there is a need for high load capacity, an 800 A single phase recloser is available for the 12, 25, and 34 KV distribution systems, see Standard OH-4001 (1746_O-17).

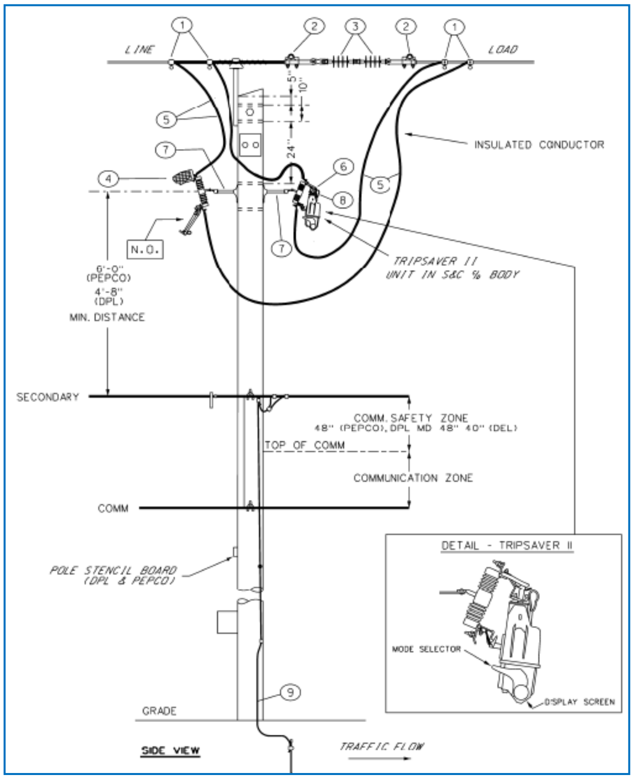

Figure 34: Trip Saver II Installation Standard OH-6906 (1069_C-306)

2.7.4 Line Expulsion Fuses

Fusing is used on the overhead system to improve reliability and customer service by further segmenting the feeder into smaller sections. This allows the outage management system to better predict the location of a fault on the system so first responders are dispatched more closely to the problem area. Pepco uses N type expulsion fuses whereas ACE uses K and DPL uses T type. The K type is fast acting and operates the fastest of the three. The T type is slow acting and therefore the slowest of the three leaving N type in the middle. Pepco lateral taps at or near the main trunk are commonly fused with a 100 amp N type expulsion fuse in a load break cutout to protect the main feeder trunk from faults on laterals. Expulsion fuses are metal alloys designed to start melting at a particular current value and completely clear in a certain amount of time based on the magnitude of the fault current. The gases produced by internal arcing "blow" the arc out This in combination with mechanical forces of the cutout door dropping and opening interrupt the fault current. Subsequent fusing should be two sizes lower than the upstream device, 75N downstream a 100N for example. The fuse coordination chart in Figure 36 shows the maximum fault current one N type fuse will coordinate with another N type and can also be used to more precisely coordinate fuses if the maximum fault current at the location is known.

pepco
An Exelon Company

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Line segment fuses must be rated above the anticipated maximum load current of the segment to avoid fuse operation during normal load conditions and should be sized to clear the minimum anticipated fault current of approximately 25 percent of the calculated minimum bolted line to neutral fault. Fuse sizes are recorded in GIS/GWD, tagged on the pole, and on feeder maps.

Engineering Practice

Revision No.: 1

2.7.5 Current Limiting Fuses

Pepco operates with a closed bus tie configuration at the substation. This operation mode places substation transformers in parallel resulting in more energy available for faults. Therefore, current limiting fuses (CLF) are widely used on the Pepco system. Unlike expulsion fuses that use mechanical and gas forces to interrupt the fault current, current limiting fuses introduce high impedance as the metallic links begin to heat and melt converting the internal sand into glass. This reduces the maximum fault current experienced by the device in series during a fault condition. Pepco uses SMS type K-mate CLFs in all areas for overhead distribution. They are used to protect equipment from being damage catastrophically during a fault event to the point of becoming a major safety hazard. Figure 37 and Figure 38 from Standard OH-6302 (C-324) show an example of a CLF and how it is installed. The CLF is installed on the top of the cutout for sizes >= 65 amps and on the bottom for lower sizes.

Engineering Practice

Revision No.: 1

2.7.6 Distribution Automation System

The distribution automation (DA) system is a computer-controlled system that ties into the SCADA and EMS interface through the fiber and radio network. It contains a model of the feeders, their breakers and reclosers which are mapped to the devices in the field. When a fault on the main trunk occurs, the upstream recloser or breaker will go through its normal protection sequence. Once it goes to lockout, the DA system will communicate with all devices on the feeder to determine which devices experienced the fault. That information allows the DA system to determine the fault location, then open devices to isolate the faulted segment and close normally open recloser ties to re-energize non-faulted segments. This automated feeder reconfiguration restores customers within a few minutes of the initial device lockout. Below is a simple example of how the system works.

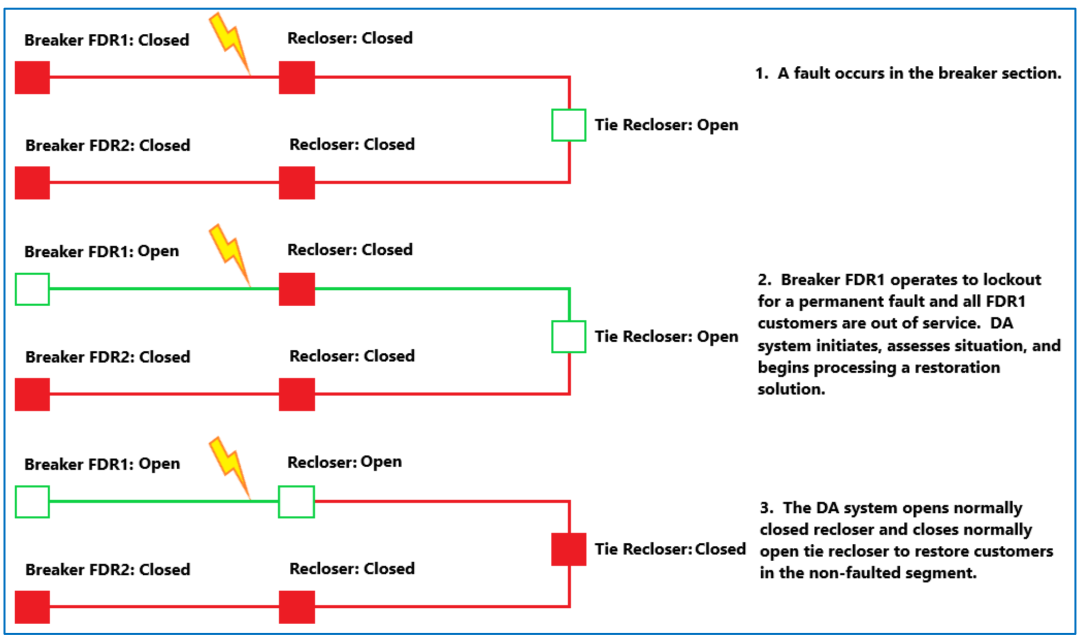

Figure 40: DA Example

2.7.7 Animal Protection

Pepco installs animal guards on all overhead equipment. The most common animal guard is the Shedmount guard in Figure 40. They are used on Viper reclosers, transformer bushings, and lightning arresters. The mini-Shedmount guard in Figure 41 is used for lightning arresters on the Viper reclosers, see technical bulletin TB-20-085. Figure 42 provides an example of both installed on a Viper recloser. Covered conductors are also used to protect against animal contacts. Tap wire comes already covered for new installations and replacement of existing bare tap wire. A conductor covering can be installed on existing bare wire

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Figure 41: Shedmount Animal Guard

Figure 42: Mini-Shedmount Animal Guard

Figure 43: Example Animal Guard Installation

The Shedmount animal guards aim to protect against animals like squirrels, raccoons, and small birds. For larger birds and in avian protection areas, avian specific coverings, excluders, and diverters are used to prevent bird contact with energized equipment and deter building nests, Standards OH-7105 and OH-7110 (C-500). The bird diverter like the one shown in Figure 44 is used to reduce the risk of collision, and should be installed every 15 ft and can be staggered on adjacent conductors to increase the spacing between diverters on any one conductor as shown in the example from technical bulletin TB-20-070.

Engineering Practice

Revision No.: 1

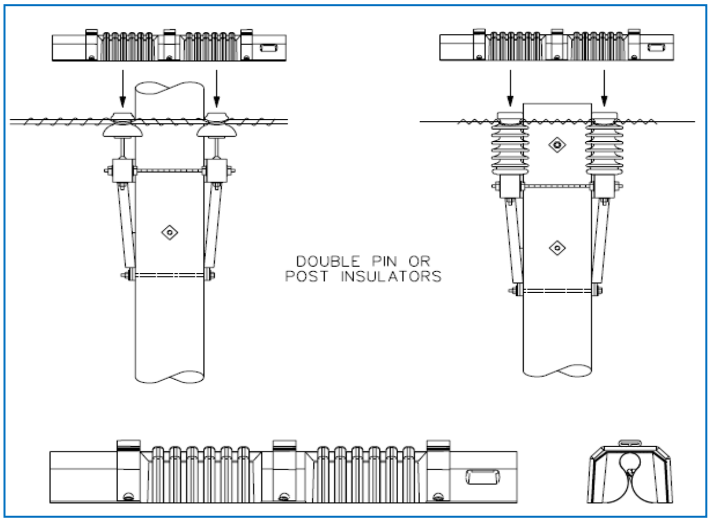

Figure 44: Avian Covering

Figure 45: Bird Diverter

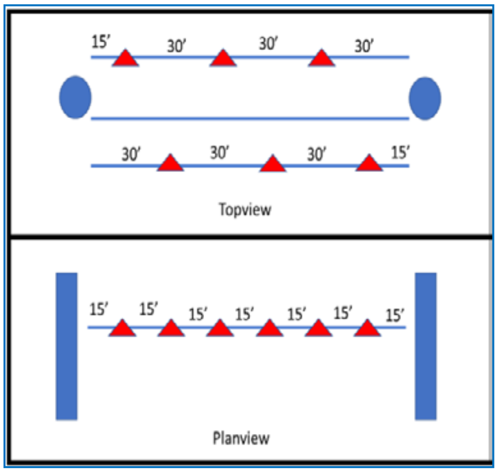

Figure 46: Bird Diverter Spacing

2.7.8 Overhead Fault Circuit Indicators

Pepco uses fault circuit indicators (FCI) on the overhead distribution system to more quickly identify faulted sections of feeders in an effort to reduce outage durations. They are installed on the primary conductor usually near manually operated switches, where the feeder branches, or long express runs. They have a trip current range of 200 A to 2400 A with a max operating voltage of 46 KV. They can withstand current up to 25 KA for 10 cycles and when they are triggered, will flash for up to 8 hours before resetting. They also reset themselves when load reaches 5 A. Figure 46 from Standard OH-6050 shows an example of a fault circuit indicator.

3. Underground Distribution

3.1. Underground Design

The underground four-wire system has evolved into a double loop system with the main radial feeder trunk consisting of loops that have branches through subway or pad mounted four-way, 3-phase, load break, gang switches. Each branch is backed up by a full capacity open tie point from another main trunk feeder. Lateral underground residential distribution (URD) loops tapped from the main feeder are made at 3-phase load break switched tap points and are fused with current limiting, back-up type fuses. The URD supplies the customer load through totally underground radial single, two, and 3-phase circuits without branches, and are backed up by similar one, two or 3-phase radial taps from the same phases of the same or another feeder at a normally open load break tie point, see Figure 47. UG systems involve manhole and vault construction in duct bank and are used for the main feeder 3-phase, express runs, or network applications. URD is typically a mix of conduit and direct buried lines that run to pad mount transformers serving customer load protected by current limiting fuses.

Mainline conduit in public space will be concrete encased 5” or 6” fiberglass reinforced epoxy conduit or, depending on application, encased or direct buried 4” PVC SCH 40 conduit. Conduit on private property installed by the customer, either direct buried or encased, must be SCH 40 PVC. In order to accommodate the larger 13 KV feeder cable, all main trunk conduit is to be 5” fiberglass conduit encased in concrete, including but not limited to tap hole connections and network secondaries. 5” fiberglass conduit should also be used in any application where there is a potential for future unfused mainline trunk primary cables. For further information on conduit, manhole, and cable and splice design, see Conduit Construction and Trenching Practice Guideline 1428 in the underground standards construction section.

Revision No.: 1

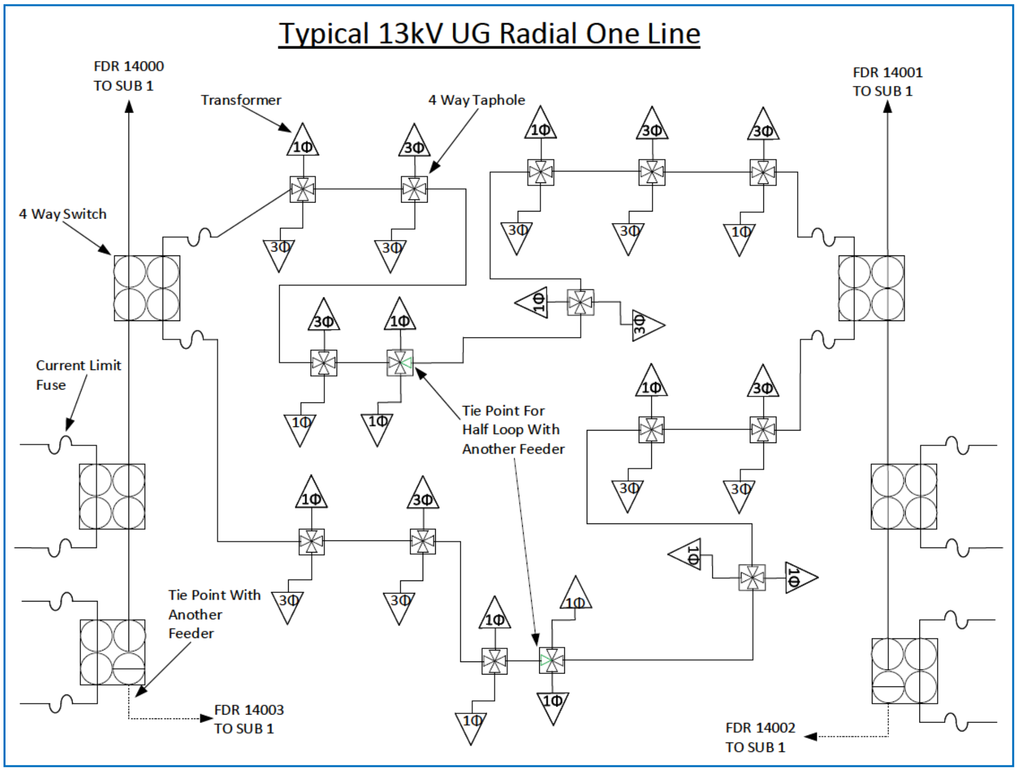

Figure 48: UG Radial 13 KV 4-Wire System Schematic

3.2. Underground Cable

The entirety of the trunk must be a cable sized to carry the full feeder load. All Pepco mainline conductors are to be copper. Currently, Pepco uses 15 KV 600 KCM CU 3-1/C EPR flat strap 133% insulated cable as the standard mainline cable. The cable has an equivalent 4/0 bare copper neutral. A 500 KCM compact flat strap with 100% insulation level is suitable when limited duct size space is a consideration. The 750 KCM flat strap cable (1644096) is also available for special circumstances, but it is not commonly used. Other sizes of flat strap cable are the 4/0 and the 350 KCM. Single legs of 750 KCM copper tape shielded cable are also available for substation getaways if derating is an issue. As in overhead construction, the standard conductor chosen for Pepco's underground distribution system facilitates normal and emergency configurations. Table 8 and Table 9 display the cable ratings for 600 and 500 KCMIL flat strap from Capacity Planning Appendix A Thermal Capacities of Cable and Wire Table III-C.

Previous construction using copper shielding neutral required a separate 4/0 compact copper neutral cable. The 4/0 neutral was decided upon as it can withstand 42 KA fault current for 10 cycles without excessive heating. One neutral sufficed for multiple feeders with lead sheaths. Flat strap cables carry their own full rated neutral within the cable jacket and do not need an external neutral under normal use.

3.3. Cable Accessories

Splices play an important role in connecting together cables on the underground system. They come in several different types, each with a variety of configurations.

Separable straight, 2-way, splices are the preferred method for the first manhole outside the substation or before a piece of equipment on the mainline. They are easier to separate compared to other splice types, making it easier to change the number of cables when adding or removing load and when the feeder is reconfigured. They come in cold shrink and premolded receptacle with cold shrink being the preferred style and premolded as a backup or for emergency use, see Standard UG-6504. Separable splices can only be used on solid dielectric cables like EPR. , Figure 50 from Standard UG-6504 (1075), features a replaceable spiking aid to assist when testing for dead

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

without destroying the cable. A minimum 6'x12' line hole should be built to accommodate splicing of separable connectors.

Cold shrink splices are the standard for mainline joints when future branch taps will not be needed. Radial feeders, dedicated feeders, and long sections of express cable are a great application of cold shrink splices. They are only used in straight applications and are the preferred method over heat shrink.

Heat shrink splices are another splice type. They are often the backup splicing method to separable and cold shrink providing an alternative means for straight and branch splice applications. They are the only splice type used for transitions between 3/C PILC and 3-1/C EPR.

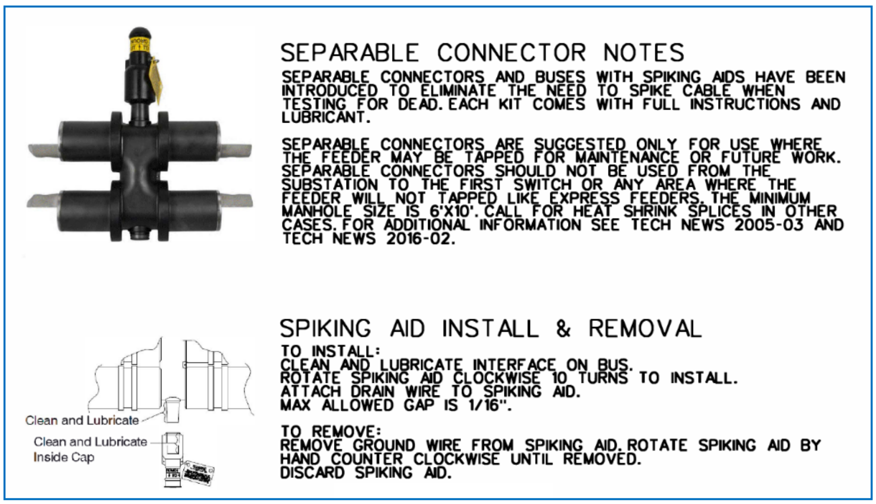

Figure 51: Separable Connector from Standard UG-6504 (1075)

Terminators are another important means of connection on the underground system. They are mainly used for overhead to underground transitions. Figure 51 provides an example of a 3-phase termination. 15 KV terminations are made with range taking cold shrink outdoor rated termination kits and 35 KV use heat shrink outdoor rated.

pepco
An Exelon Company

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

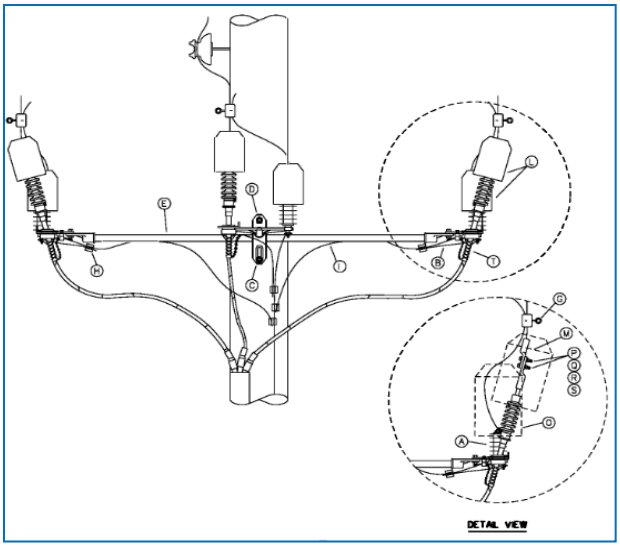

Figure 52: 3-phase Termination Example Standard UG-1100 (Z-420)

For secondary cable, pre-molded secondary busses are available. These copper "S-busses" eliminate problems with hand taped joints and were decided as a best practice in 2012. See Standard UG-6504 (1075) & Technical News 2005-03.

3.3.1 Grounding of Splices and Terminations

The adopted grounding practice dictates that each splice or termination shall have an external ground braid that is bonded to the system ground. When splices are not grounded it can damage a larger footage of cable or lead to touch voltage between the shield and ground.

3.4. Guidelines for Primary & Secondary Cables

- Never bring back fused primary cable into a switch, transformer, or fuse hole. Never run 3-phase into an equipment hole or fused primary through an equipment manhole.
- If radial primary feeder and secondary mains are in the same hole, then they must be racked on different walls. If they absolutely must be on the same wall, rack the secondary above the primary. Arc proof taping should be applied when cables are within 10 inches of each other, see Standard UG-6802 (1398).
- Load calculations must always be performed.

All designers should additionally review G-1441 LVAC Guideline for further best practices and information regarding the derating of cables due to multiple sets of cable in a shared duct bank.

Regional Engineering is responsible for determining whether or not, to facilitate future system expansion and rearrangements, the installation of conduit is required in advance of paving streets, roads and thoroughfares in new developments which will connect two collector streets, roads or thoroughfares.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

3.5. Underground System Protection

The underground four-wire distribution system has the same array of protective equipment available as the overhead. Feeder breakers, reclosers, and fusing are all present if the UG distribution has a portion of overhead upstream. However, the underground system faces its own unique challenges that drive some differences in system protection.

3.5.1 UG Fusing

The current limiting fusing (CLF) is different when mounting inside a manhole. 150E-EJO fuse types are used for CLF applications. Figure 56 shows an example of UG encapsulated CLF from Standard U-6215. Underground secondary networks are fused on the secondary side with network protector fuses and bayonet fuses are used in pad mount transformers to provide protection to the system should there be a primary or secondary fault at or downstream the transformer, see Table 14 in the appendix for details. For a subsurface or subway type transformer located in a manhole that is supplied from an overhead line, the bayonet fuse holder is to be slugged and there is to be a load break cutout fused on the pole only. An expulsion fuse, normal rated, is to protect the transformer and the backup (CL) fuse when there is overhead distribution upstream.

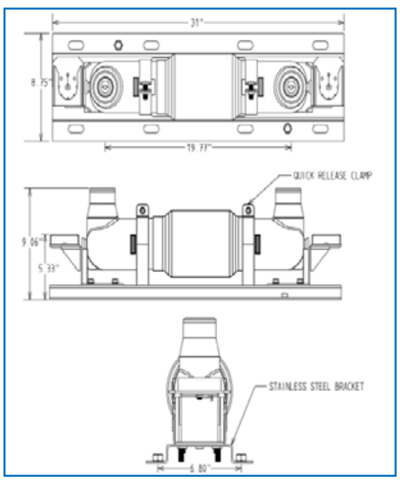

Figure 53: UG Current Limiting Fuse 150E-EJO

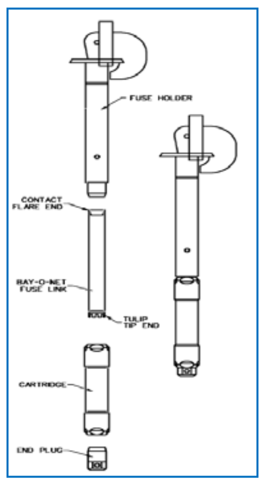

Figure 54: Bayonet Fuse

3.5.2 Underground Switches

Pad mounted and subway type load break gang switches are to be installed in accordance with approved guidelines for the application of 13 KV Oil Switch Guideline G-1443. On subway switch installations, phase and test modules are to be provided for all switch ways.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Switches should always be installed with a test module that is used for phasing as well as testing for dead without the need for the crews to be in the manhole. Currently all ways on switches used on the system are 3 position – Open, Closed, and Ground.

While it's preferable to utilize pad mount equipment in most scenarios; certain cities, like DC and the City of Rockville do not allow any pad mounted equipment in the public space. In this case underground radial feeders requiring sectionalizing will require multiple switches along the trunk of the feeder. Unlike network feeders branch splices are prohibited on radial feeders. As seen in Figure 47, 4-way switches are installed along the main trunk of the feeder normally with the configuration of: an in, out, and two fused ways. However, since the switch isn't fused the switch could be used as an in, two out, and one fused way. The end of the underground radial feeder will have a normally open tie with another feeder from the same substation. Unused ways should be left in the open position.

3.5.3 Surge Protection

When an underground trunk is subjected to overhead exposure, submersible arresters should be provided as near as practical to the remote switch open points if such exist. Surge arresters are available for open points in the underground system in the form of 200 amp style elbow terminators. Arresters can be placed on test modules for vault based equipment or on four-way test modules for the new style of horizontal submersible single-phase transformers. Elbow arresters can be piggy-backed on 600 amp t-body elbows with a 200 amp tap at pad mounted switch terminals. They can also be used as test module bushing covers at subway switch installations. Further they can be placed on the second bushing of loop feed equipment. For pad mounted equipment the elbow arrester is to be used on the H1B bushing at open points at the end of the URD loop.

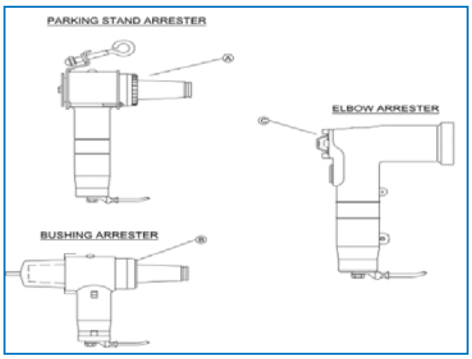

Figure 55: UG Surge Arrester Example Standard UG-6832

3.5.4 UG Fault Circuit Indicator

In order to reduce the duration of outages and improve the reliability of Pepco's distribution system, underground FCIs are to be installed on the outgoing feeders at the load break elbow, see Figure 55 from Standard UG-6050. It has similar ratings as the overhead FCI and it is important to ensure the neutral is not under the FCI. FCIs should be installed on elbows exiting transformers (pad mount, subway, or subsurface),

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

switchgear, fuse enclosures (transclosures), and tap holes for underground and URD construction. The FCI identifies peak load current and automatically adjust to proper trip rating with minimum trip current of 200 A. It automatically resets after 8 hours or when load current reaches 5 A for small core and 10 A for large core. The FCI is powered by a non-replaceable battery with a 20 year shelf life and over 1500 hours of indicating time. They can also be equipped with an integral LED indicator. The indicator can be viewed remotely by means of a strategically placed fiber optic remote lead cable when the FCI is installed inside of a metal enclosure. If the indicator is installed inside an underground vault, the fiber optic cable is to be removed and an optical diffuser snapped into its place over the LED. 3-phase optical cables are ganged into a single indicator.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

4. Underground Residential Distribution

4.1. URD Design

Underground residential distribution (URD) is a radial system that delivers power to the customers. Where URD four-wire distribution is installed, the accepted industry design ratings for 15 KV class URD equipment is 8 KV 200 amperes continuous and 10,000 RMS symmetrical amperes short circuit withstand and safe close for switching. These ratings place mandatory restrictions on distribution system design. Although the URD system is radial, it can be looped with a segment of URD of the same phase with a normally open point between to allow for load transfer for maintenance or emergency restoration.

Residential URD developments are looped when there are 30 customers or more, where a natural loop exists; and/or two or more entrances to the development. Commercial and industrial customers are looped when multiple customers are fed from 2 or more transformers. Looped design is also recommended for critical customers such as hospitals, airports, wastewater, and public safety. In general, looped primary cable should be installed in separate trenches where practical to prevent dig-ins or cable failures from damaging both cables in the loop, and to eliminate the need to de-energize both cables while isolating and identifying the faulted cable.

URD loops can be constructed in many ways. Common examples are 3-phase to 3-phase loops, 3-phase that branches out into multiple 1-phase loops of the same phase and 1-phase to 1-phase loops of the same phase. URD lateral loop switching is normally done with 200 A load break elbows. The loop open-point should, whenever practical, be made at a 3-phase device. This rule will generally negate the unsafe practice of having single phase loop tap cables of different feeders in a common trench which makes identification of cables difficult during maintenance. Further, this practice will minimize switching points for routine switching and emergency restoration. If a 3-phase transformer is not available, a tap hole should be used to provide the 3-phase open point. All 3-phase cables to a 3-phase transformer must originate at the same cable pole or transclosure.

Double cable poles, riser or transition poles with two or more sets of cables, shall not be built except where that is the only way to provide backup or a loop feed. Double cable poles are a single point of failure that can result in an interruption to the entire development negating the benefit of the loop feed design, and greatly obstructs climbing space.

The equipment short circuit ratings of 10,000 amperes with a capability of up to 40 kA requires that current limiting devices are placed upstream to reduce the effective available fault current to less than 10 kA. It is a standard practice on the Pepco URD system to install CLFs at the beginning of every URD half-loop.

The 8 KV line to neutral rating of the lateral tap CLF, dictates that all equipment beyond the loop-tap fuses be connected phase to neutral. Multi-phase lines must be effectively shielded to prevent phase to phase short circuits which do not involve the neutral. And, they should be designed so that back-up half loops are of the same phase from a different feeder from the same substation whenever practical.

The continuous current equipment rating of 200 A, when used in the open loop system, places a normal maximum design load restriction of 100 A, 800 connected KVA, on each phase of a half-loop tap. The full loop load of 200 A per phase can then be carried from either end, in an emergency, or on a planned outage, without loading the equipment beyond the design emergency rating. In addition, the lateral tap fuse can be subjected to transformer magnetizing inrush current and cold load pickup, which provides additional justification for limiting the aggregate of half-loop transformer name-plate ratings to approximately 800 KVA per phase connected. The 150E EJO CL fuse is a partial range or back-up fuse and is considered capable of withstanding a 33% overload of 200 A for an eight-hour period.

Capacity Planning requires that distribution feeders have no more than a difference of 45 A (360 KVA) between the highest and lowest loaded phases.

Connected KVA on multi-phase half loops shall be substantially balanced and the 800 KVA maximum per phase per half loop guideline still applies.

These values are maximum home counts for areas where geographical features ensure that no further construction will be added to the half-loops.

Type of Homes	1-Phase	2-Phase	3-Phase
Electric Heat	< 30	30-60	> 60
Non-Electric Heat	< 60	60-120	> 120
Townhouse Electric Heat	< 40	40-80	> 80
Townhouse Non-Electric Heat	< 80	80-160	> 160

Table 10: Number of Homes on Half Loops in Subdivisions

The limits shown above were calculated as follows:

$$\frac{45A \times 13.8kV}{\sqrt{3}} = 360kVA \text{ maximum unbalance}$$

Equation 1: Maximum Unbalance of 13.8 KV

Construction Type	Houses / Phase	KVA/Home
Single Family, Electric Heat	30	12
Townhouse, Electric Heat	40	9
Single Family, w/o Electric Heat	60	6
Townhouse, w/o Electric Heat	80	4.5

Table 11: Homes Allowed per Phase

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

It should be noted that Planning is currently using the 2016 Facility Load Calculator worksheet to examine requirements for prospective new businesses. This worksheet looks at the building type and square footage of the building to calculate a power requirement. This worksheet will be approved for use by the design groups in Maryland and DC soon but was not included in this document as it is still under review.

Concurrence from Capacity Planning must be obtained prior to any configuration changes that would result in transferring load from one feeder to another feeder, one phase to another on the same feeder, or in supplying new customers from other than the recommended supply feeder.

URD loops tapped from overhead feeders will normally be made in accordance with Standards OH 1833 (0922) & OH 1811 (0923) for 3-phase and single-phase, respectively. Since overhead feeder trunk sectionalizing and backup is normally provided in the overhead system design, further overhead sectionalizing should not be required.

From the lateral tap CLF, the URD primary loop is extended radially, looped through each transformer, or tap hole for transformers in manholes, in one continuous line up and down streets in and out of cul-de-sacs as required to supply the required transformers. A single-phase half-loop will normally be a composite of single-phase loads and one-third portions of 3-phase loads. For DC, the installation is made in conduit, in public space, or in easements on private property as appropriate to physical conditions. Facilities should only be placed in public space when private property easements cannot be obtained. Maryland installs conduit in public space and direct buried in private space, see Guideline 1428 Conduit Construction and Trenching Practices for more details.

Where a planned single phase URD loop extension is relatively long and may be expected to be completed in more than one phase of construction, two or more cables should be extended so that loop feed can be maintained.

Where the URD loop tap cables would loop out and back in common trench, identification of cables buried randomly in trench would be difficult and unsafe to maintain. Provided that one of two cables or three of six cables for 3-phases can be place in a direct buried conduit from terminal to terminal for ready identification, a common trench can be utilized. Otherwise, the cables should be place on opposite sides of the street or in separate trenches or bores in the R/W with a minimum of three feet of horizontal separation.

pepco
An Exelon Company

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

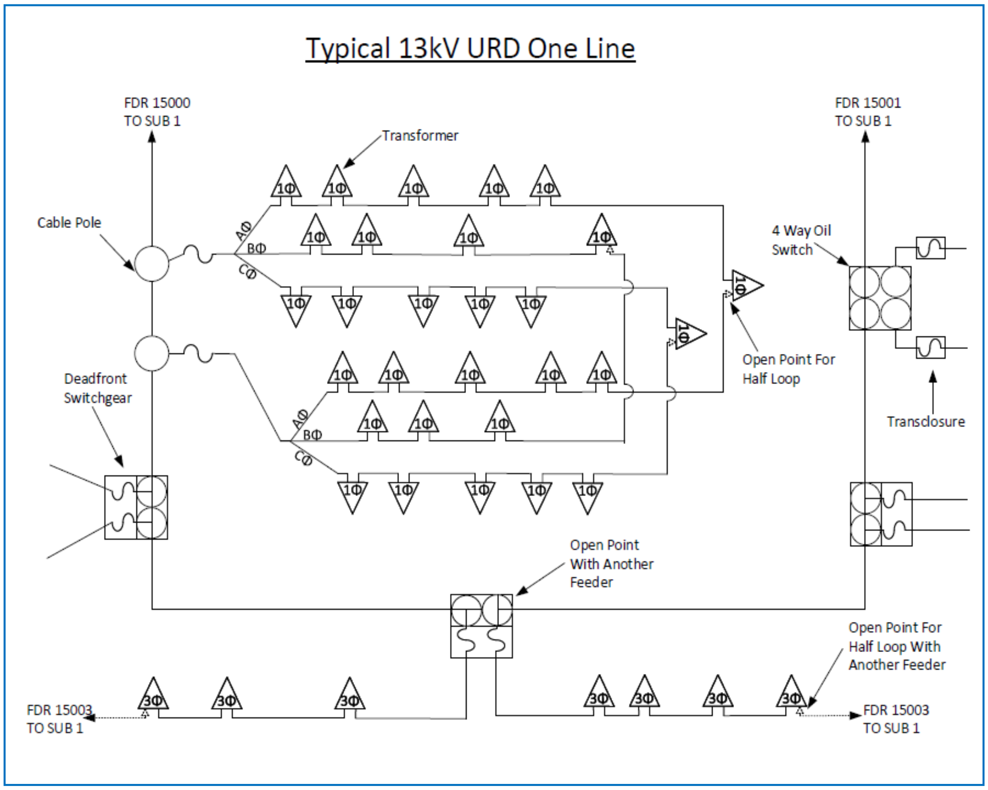

Figure 59: Example of URD Design

4.2. URD Cable

Pepco uses #2 7-stranded compressed copper with 133% IL EPR insulation for URD installations. The neutral is 15-#14 AWG concentric neutral wires. The jacket is 50 mils of linear low-density polyethylene (LLDPE). These cables are suitable for installation in conduit or direct buried in dirt.

4.3. URD Switching

Pepco has two available switches that can be used as means to isolate the URD system.

- One switch is the Padmount 4-way oil switch, Standard UG-3710. The oil switch is a load break device rated up to 64 KA symmetrical fault. If one or two of the ways of the oil switch will be suppling customer load than a pad mounted fuse cabinet, transclosure, will need to be installed nearby, Standard UG-6200.
- The other switch is the pad mount dead front air switch. The PME switch gear is a load break device rated up to 24 KA symmetrical fault and 600 A continuous current. The air switch is the preferred equipment for locations with fault current 25 KA and lower. The air switch comes in two variations: 2 switching ways and 2 fused ways, PME-9 Standard UG-3750, and 3 switching ways and 1 fused way, PME-11 Standard UG-3751. Padmount dead front air switches do not require a padmount fuse cabinet. Figure 59 shows an example of PME switch gear.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

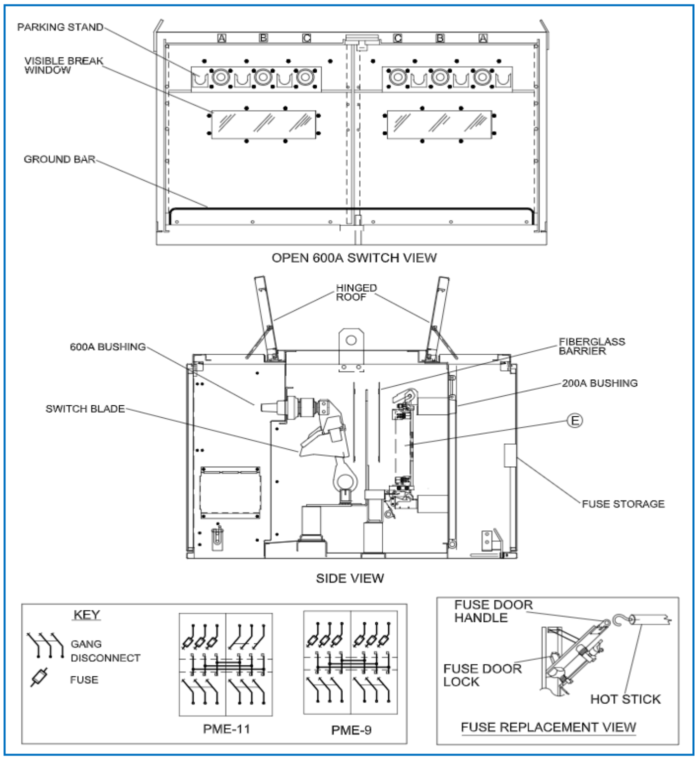

Figure 60: Dead Front PME Switchgear

URD loops can be constructed in many ways. Common examples are 3-phase to 3-phase loops, 3-phase that branches out into multiple 1-phase loops of the same phase and 1-phase to 1-phase loops of the same phase. URD lateral loop switching is normally done with 200 amp load break elbows. The loop open-point should, whenever practical, be made at a 3-phase device. This rule will generally negate the unsafe practice of having single phase loop tap cables of different feeders in a common trench which makes identification of cables difficult during maintenance. Further, this practice will minimize switching points for routine switching and emergency restoration. If a 3-phase transformer is not available, a tap hole should be used to provide the 3-phase open point. All 3-phase cables to a 3-phase transformer must originate at the same cable pole or transclosure.

Double cable poles, riser or transition poles with two or more sets of cables, shall not be built except where that is the only reasonable way to provide backup or a loop feed. Double cable poles are a single point of failure that can result in an interruption to the entire development negating the benefit of the loop feed design. Double cable pole construction greatly obstructs climbing space and is to be used only beside paved roads within ten feet of the curb or roadway and easy bucket truck access.

In locations where accessibility by a trouble bucket may be hindered, the URD tap should be made with a gang-switch accessible to an operator on the ground. The CL fuses would then be normally pad mounted or, if required, subway in manholes.

Branches on URD loops are to be made only with modules and load break connectors in tap holes or sectionalizing cabinets, and only to supply a single transformer or single feeder supply to a high voltage customer. Otherwise, “T” taps are prohibited.

URD tap holes are to be used for only three conditions:

1. Where construction delays would require the temporary test capping of two or 3-phases in common trench, a temporary tap hole should be used to provide for temporary emergency backup. This tap hole should be relocated or eliminated as construction progresses.
2. Tap holes or sectionalizing cabinets can be used as the loop feed through and tap for radial transformers in manholes where elbow switching at the transformer is not recommended.
3. In those instances where single phase open tie points would result in loop cables from different feeders being in a common trench, a 3-phase tap hole should be used to provide the open tie points. Except for these three conditions, tap holes should not be used for new work and removed during future system changes.

There are some unique scenarios when performing URD switching. When tying two circuits together from different substations, it may be necessary to take a momentary outage, break before make instead of make before break, to avoid overloading caused by circulating current. When closing an open point that would tie across a regulator, bi-directional or uni-directional, the regulator must be placed in the neutral position and the controls turned off prior to loop tie switching. It is common practice to only create loop tie points using the same phase to improve safety. However, there is one exception, for a two or 3-phase loop extension under construction in the same trench and in a temporary tap hole with phases clearly identified.

4.4. Transformers & Secondary Cables

Both Underground and URD construction utilize single phase pad mount, 3-phase pad mount, and single-phase subsurface transformers. Underground construction additionally uses 3-phase subsurface and single-phase subway type transformers for banking in manholes. Transformers on the 4-wire system are wye configured and on the 3-wire system can be wye or delta configured.

4.4.1 Pad Mount Transformers

Single phase pad mount transformers are available in sizes of 25, 50, 100, and 167 KVA with a 250/125 volt secondary. For new construction, single-phase pad mount transformer size should be limited to 100 KVA or smaller with 167 KVA units being held in reserve for heavy-up use. A 167 KVA single phase pad mount transformer is not available in dual voltage due to fuse coordination issues. Due to maintenance concerns of select existing silo style subsurface transformer installations, single-phase pad mount transformers mounted on flat concrete pads are a more reliable conversion option. (These conversions are made at the discretion of the construction crews.) 3-phase pad mount transformers are available in the sizes of 75, 150, 300, 500, 750, and 1000 KVA with a 216/125 volt secondary. The 460/265 secondary class adds the larger sizes of

1500, 2000, and 2500 KVA. Single-phase and 3-phase pad mount transformers are available in dual voltage units for use in areas converting from 4 KV primary voltage to standard 13 KV primary voltage. Below are some examples of pad mount transformers.

Figure 61: 1 PH Pad mount

Figure 62: 3 PH Pad mount

4.4.2 Subsurface Transformers

Legacy silo style single phase subsurface transformers are stocked in the sizes of 25, 50, 75, and 100 KVA with a 250/125 volt secondary, Standard UG-6722 (1424) maintenance only. Due to enclosure limitations 100 KVA is the largest size available. The new style "horizontal" single phase subsurface transformers Standard UG-3150 (1426) are the current standard and are available in 25, 50, 75, and 100 KVA. These transformers are solid insulation distribution transformers (SIDT) for various applications under separate stock numbers, Standard UG-6723. The SIDT transformers are protected by a full range current limiting fuse integrated into the elbow terminator. 3-phase subsurface transformers are stocked in 500, 750, and 1000 KVA with a 216/125 volt secondary and 750, 1000, 1500, 2000, 2500 KVA with a 460/265 volt secondary.

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

Figure 63: Example 50 KVA SIDT Transformer

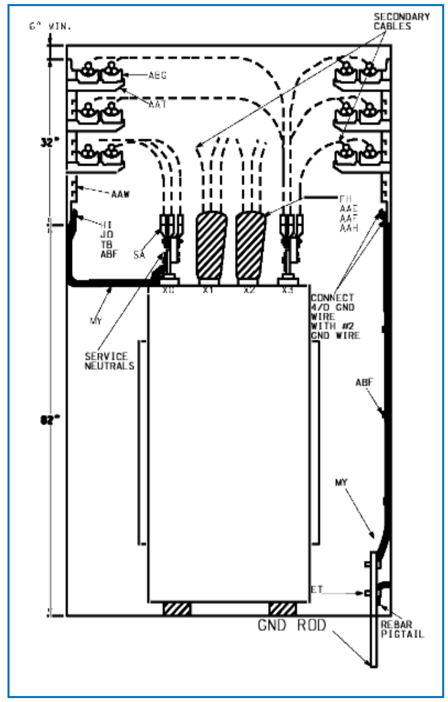

Figure 64: Subsurface Transformer, Standard UG-1323

4.4.3 Subway Transformers

Single phase subway transformers are suitable for banking. For the 125/250 service; 167, 250, and 333 KVA are offered. For the 460/265 volt service; 50, 100, 167, 250, 333 KVA are available. Pepco also stocks a 25 KVA step down transformer for converting the 13 KV to 4 KV. Single-phase subway type transformers larger than 167 KVA are to be used only for banking. 3-phase services served by subway transformers are limited to 3000 A.

4.4.4 Secondary Cables for Vaults

Copper secondary cables are used for network distribution and substation vault applications. Copper secondary cables are insulated with EPR ranging from 30 to 65 mils and then encased in between 15 to 65 mil TS-CPE fire retardant jacket depending on the cable size. The thermoset CPE jacket on these cables offers the "BEST" rating in the categories of fire resistance, oil/chemical resistance, flexibility, abrasion resistance, and temperature range. The reels of cable are available as three legs laid parallel and color coded red, green, and black or as single leg reels available in only black. A single legged 500KCMIL (1650119) white insulated cable is also available for service neutral identification where water proofing is required for a service which enters a building below grade.

CATID	Conductor	Rating (A) Direct/Duct
1650125	1500 KCMIL 1/C	1058 / 904
1650115	1000 KCMIL 1/C	882 / 741

1650151	#10 1/C	47 / 40

Table 12: EPR CU Conductor Secondary Power Cables PHI SPEC S-1601

Underground secondary and service cables which are to be spliced in manholes or terminated at transformer terminals in manholes which require taping for insulation must be copper. See Standard OH-5000 (1744_C-501) for all secondary cable ampacities.

4.4.5 Secondary Cables for Direct Burial and URD

Ruggedized aluminum XLPE URD cables for pad mounted and subsurface single-phase transformers have been provided under PHI Spec 1605. The services have between 80 to 110 mils of XLPE insulation and are suitable for conduit or direct burial.

CATID	Conductor	Industry Code	Rating (A) Direct/Duct

Table 13: Secondary URD and Direct Buried Conductors, PHI SPEC S-3-1605

5. 4 KV System Considerations

Conversion of the existing 4 KV system to other higher voltages like 13 KV began in 1958. As the 4 KV system shrinks so does the stock of its associated equipment. A small amount of equipment is kept in stock for maintenance purposes with most of the equipment now dual voltage rated, for example 4 KV and 13 KV.

15 KV URD cable and cable accessories are being used with dual voltage transformers for 4 KV underground system maintenance and rearrangements in conformance with these guidelines. Since our 4 KV circuits are capable of providing more than 30,000 amperes at some locations the Bay-O-Net (expulsion) fuses and load break elbows rated for 10,000 amperes can be overloaded. The dual voltage subsurface and pad mounted transformers incorporate Bay-O-Net fuses which are rated for a fault clearing capability of 8,000 amperes or less at 4 KV. When the anticipated fault current will exceed 8,000 amperes, backup current limiting fuse protection is required. A 100E EJO 2.5 KV CL fuse (1656697) is in stock for this purpose which can be used with the standard transclosures or submersible 8 KV fuse enclosures.

If a transformer is to be placed within one half circuit mile of a substation, fault current calculations should be made or backup protection (current limiting) should be provided.

6. Development History

Revision 0	**Date: 11/30/2016**
Writer	Unknown
Reviewer(s)	
Reason written	The purpose of the document is to provide a general description of the Pepco 4-Wire 13 KV distribution system.

Revision 1	**Date: 1/1/2021**
Editor	David Andrews (Sr. Engineer, Overhead Standards)
Reviewer(s)	Stephen Park, Nicholas Cincotti, Robert Spelman
Major Changes	• Reformatted and reorganized document content and layout • Added pictorial representations of concepts • Updated content information and validated accuracy • Converted stock numbers to CATIDs and included new Standard Document numbering • Added new equipment

Distribution Standards Guideline 1442

Engineering Practice

Revision No.: 1

1. OFC is an oil fuse cutout only for 4 KV subway transformer switching and fusing. When OFC's are used slug the Bay-O-Net. When switching is done by elbows, fuse the Bay-O-Net. Fuse the OFC or the Bay-O-Net but not both.
2. The Bay-O-Net under oil expulsion fuse normally uses a dual element, overload sensing fuse (DEBF) which is sensitive to hot oil.
3. In emergencies, extreme weather, where overloads may melt the (DEBF), substitute a single element, fault sensing only fuse (SEBF) to be found in and returned to the Tool room.
4. The numbers in the chart for the DEBF & SEBF are the fuse designating numbers at the end of the manufacturer catalog numbers printed on the fuse and are not to be confused with an ampere rating. Examples: Cat. #4038108C06 is a dual element link, 20 amperes, designated C06 in the chart; Cat. #4000353C08 is a single element, fault sensing link, 20 amperes designated C08 in the chart; Cat. #4038361C04CB is a dual element, overload sensing link, 160 amps designated C04CB in the chart. The C03CB, C04CB and C05CB whole cartridge must be replaced when they blow. The individual links are not replaceable in these three cartridges.
5. The underground, 4 KV oil fuse cutout fuse ratings are in amperes.
6. Subway transformers and 3-phase subsurface transformer are not to be overloaded and should be refused only with the proper (normal) "N" size fuse when fused on the pole.
7. Overhead cutout fuses are ANSI "N" type fuses. The "N" fuse ratings are in amperes.
8. The K-mate fuse number indicates only that it will coordinate over the equivalent "K" type of string fuse link. It will also coordinate over one size larger "N" link.
9. The 100E & 125E CL fuses are properly sized to protect the 1500 & 2000 KVA transformers respectively and the 150E CL fuse is properly sized for the 2500 KVA transformers as full range fuses and are to be used in the 150E fuse holder when fusing a single radial transformer not in a loop feed arrangement on a pole, in a transclosure or subway fuse box. These fuses are required for protecting transformers received prior to 1999 which are not equipped with the Bay-O-Net fuses.

Exhibit OPC (E)-5
Formal Case No. 1176

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 4

QUESTION NO. 7
Referencing Pepco Exhibit H-2 and project Investment Tracking Number ("ITN") 72525 - Mt. Vernon Sq Sub Construction 230/13kV Sub (Pepco Exhibit H-2 at page 15 of 216).

a. Provide updated and current long-term and short-term load forecasts for all substations affected by the addition of Mt. Vernon Substation which should include the Northwest Substation, 10th Street Substation, and Florida Substation.

b. Provide updated and current long-term and short-term forecasts for LVAC groups that are planned to be relieved by the Mt. Vernon Substation.

c. Has Pepco made any adjustments to its load forecasting methods since June 2018? If so, please provide the updated methods.

RESPONSE:

a. Please refer to the attachment labeled: FC 1176 OPC DR 4-7a.

   Please note: the Northwest Substation was interpreted as the Northeast Substation because Pepco does not have a Northwest Substation in the District and the Northeast Substation is associated with Mt. Vernon Square substation.

b. Please refer to the attachment labeled: FC 1176 OPC DR 4-7b.

c. Yes, as noted on pg. 13 of Company exhibit Pepco (H)-1, the forecasting began transitioning to a new Planning tool, the Distribution System Planning Load Forecasting (DSP-LF) program in 2021. The program compares the historical weather patterns for the previous year against a thirty-year record of weather patterns. Feeder and substation loads during the summer and winter periods are adjusted to match values expected during temperature extremes projected to occur once in a ten-year period. These historical values are projected by the program into the upcoming ten-year period by adding new customer load requests submitted by the developers and anticipated area growth trends beyond the submitted requests, including anticipated electric vehicle charging loads and fossil fuel heating system conversions.

	DC TOTAL	**2283.3**	**2310.0**	**2305.8**	**2032.8**	**2092.5**	**2069.2**	Avg. Trend = -1.95%

Notes: All substations supply 13.8kV of primary power unless otherwise noted.
Loads shown are actual readings taken during peak summer conditions.
Totals shown are the sum of undiversified peak loads and are not meant to be used as official Pepco system peak loads.
Trends shown are based on the straight line regression of the loads and include transfers amongst the substations.

Re: <u>PEPACR-2021-01 and Formal Case No. 1119</u>

Dear Ms. Westbrook-Sedgwick:

Attached please find Potomac Electric Power Company's 2021 Annual Consolidated Report. In addition, per Order No. 20203, Pepco has included Attachment F, which provides required information related to the Downtown Resupply Project.

Please feel free to contact me if you have any questions regarding this matter.

Sincerely,

/s/ *Dennis P. Jamouneau*

Contents

INTRODUCTION[1]

Potomac Electric Power Company (Pepco) herein presents its 2021 Consolidated Report combining three reporting requirements directed by the District of Columbia Public Service Commission (Commission) in Formal Case Nos. 766 and 991. The three reports comprising the Consolidated Report are identified respectively as the Comprehensive Plan for the Planning, Design, and Operation of the Distribution System within the District of Columbia (Comprehensive Plan), the Productivity Improvement Plan (PIP), and the annual Manhole Event Report. Additionally, a section of References has been included at the end of the report.

Additionally, Attachment D includes information related to Paragraph 60 of Attachment B to Order No. 18148 and discusses Pepco's 2020 safety performance and initiatives as well as a report by Exelon on existing safety and cybersecurity policies. References to previous Commission directives are included in footnotes or the body of the report, as noted throughout. Attachment E is included as Pepco's Vegetation Management attestation, in accordance with Paragraphs 98-99 of Order No. 19119. Attachment F provides the information required in the Commission's Order No. 20203 regarding the Downtown Resupply Project.

---

[1] Order No. 18148, *In The Matter of the Joint Application of Exelon Corporation, Pepco Holdings, Inc., Potomac Electric Power Company, Exelon Energy Delivery Company, LLC and New Special Purpose Entity, LLC for Authorization and Approval of Proposed Merger Transaction*, Formal Case No. 1119, at P 1 (March 23, 2016) ("Merger Order"). The Commission subsequently issued Order No. 18160 (April 4, 2016) correcting certain errors in the Merger Order and in Attachment B to the Merger Order (the "Merger Commitments").

Summary

The following is a brief description of the four parts of this Report:

Part 1: Comprehensive Plan

During Commission hearings on November 5-7, 2001, addressing Formal Case No. 991, the Commission issued directives, followed by Order No. 12293, requiring the Company to produce and submit its first Comprehensive Plan on February 8, 2002. Pepco's filed report presented a compilation of major elements of its underground distribution construction and plans as well as supporting technologies and conversion programs to improve system reliability. Over the years, the Comprehensive Plan has evolved with Commission orders to address current issues. In 2020, the Comprehensive Plan covers similar material to the 2019 Comprehensive Plan.

Part 2: PIP

On November 1, 1982, in Order No. 7668, the Commission adopted final rules regarding the submission of an annual PIP in Formal Case No. 766. These rules are codified in Title 15 of the District of Columbia Municipal Regulations, Chapter 5, Rules 502.1 and 502.2. Because of the divestiture or transfer to an affiliate of all of Pepco's generating stations, most of these rules are no longer applicable to Pepco's operations. Instead, this PIP was compiled pursuant to the latest requirements for Pepco to report on its transmission and distribution system operating performance and measures to improve service reliability.

Part 3: Manhole Event Report

In 2000 in Formal Case No. 991, the Commission issued Order No. 11716 requiring Pepco to file an annual Manhole Event Report on the previous year's manhole incidents. Part 3 of the Consolidated Report includes descriptive statistics regarding reportable events, a trend analysis for slotted manhole covers, and a listing of splice data. Appendix 3A contains a listing of 2020 Manhole Events. Appendix 3B includes a discussion of the 2020 Manhole Inspection Program including annual program results. Appendix 3C contains Pepco's update on implementation of its Network Accuracy Procedure.

Part 4: References

Part 4 of the filing contains a compilation of abbreviations, acronyms, and technical terms and diagrams; and a section providing Commission Order references delineating the history of the Consolidated Report requirements.

PART 1: 2021 COMPREHENSIVE PLAN

SECTION 1.1– SYSTEM PLANNING[2]

[2] The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. The Commission requested that the Company provide a Comprehensive Plan detailing proposed changes to the electric system for the purposes of meeting load growth or maintaining system reliability. On pages 143-144 of the hearing transcript, Pepco's Witness Gausman explained the nature of the Company's existing plans for the distribution and transmission systems. The Company expanded its responses to the Commission's requests in the first filed Comprehensive Plan. Since that date, the Company's Comprehensive Plans have been expanded based on several Commission directives. The report that follows either expands upon the discussion in the initial hearings requesting the Consolidated Report or responds to subsequent Commission directives as cited below.

The following section of the report addresses system plans based on forecasted load growth. In Order No. 12804 paragraph 53 B, the Commission stated the following:

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO: (b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report.*

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO:*
>
> *(b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report.*

The mission of System Planning is to develop a rational and orderly plan for Pepco's existing and future electric system needs that will provide reliable electric service to customers and support load growth in a cost-effective manner. In order to accomplish this mission, the North American Electric Reliability Corporation (NERC) / Reliability First Corporation (RFC) Standards and Pepco's Planning Criteria for the transmission, subtransmission, and distribution systems govern the design of the electric system.

Pepco continuously analyzes the adequacy of its electric system to meet demand for energy on its system and to plan for future growth. The Company maintains engineering and operating criteria for use in the design of new and modified portions of the system. To provide for rational and orderly changes to the electric system, Pepco has developed engineering and operating criteria that it applies to the design of new and modified systems. The three major components of system planning criteria are (1) voltage and reactive support, (2) ratings of facilities, and (3) reliability. For example, voltage on a nominal 120-volt system must be maintained between 114 and 126 volts under normal conditions and between 105 and 126 volts under contingency conditions. Ratings of facilities include normal, emergency, and short-term emergency ratings on all facilities including feeders, power transformers, circuit breakers, for both summer and winter periods. In terms of reliability, the data that are reviewed and tracked include historical and forecasted load compared to capacity of the feeders, feeder groups, and substations.

1.1.1 The Current Load Forecasting Process[3]

Planning for future load growth starts with the development of load growth projections. A forward-looking 10-year peak load forecast is developed and maintained for each distribution system component such as feeders, substation transformers, and substations to plan for longer duration projects. Short-term, summer-peak forecasts are developed for three years to address the more frequent changes from new building construction and customer load growth that occurs across the distribution system. Long range forecasting (four to ten years) is used to develop advance plans for longer duration projects or

[3] In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, the following topics were discussed, as cited on pages 141-144 of the hearing transcript:

- Comprehensive long-term planning on the underground system
- Pepco's 10-year construction plans
- Distribution load growth forecasts by substation
- Transmission/substation supply load growth forecasts

construction projects that require more than two or three years to complete, and to identify future capital projects in the Construction Budget Forecast process.

Forecasting begins with the examination of the summer historical loads for each feeder and substation on a two-year cycle. Further, actual new customer loads from submitted class of service forms and other available development reports, planned changes in feeder configuration and emergency transfers, and reductions due to distributed energy resources (DER) are also analyzed. The individual feeder and feeder group loads for each year are calculated and adjusted to produce the substation load predictions for each year of the plan.

As part of the 2022-2031 Ten-Year Load Forecast, which Pepco will provide in the 2022 ACR, Pepco will employ the results of its updated Distribution System Planning Load Forecasting (DSP-LF) program. The DSP-LF program is currently in the testing phase and is expected to be in use later in 2021. Please note that the updated and enhance load forecasting program will cause changes not just to the results of the forecasts themselves, but also the methodology and process. Thus, the information, data, and process contained in this 2021 report will be modified for the 2022 report.

The DSP-LF application will assist Capacity Planning engineers in evaluating plans that include Non-Wire Alternatives (NWA), satisfying the need for more improved modeling of the many time varying effects on system operation, such as PV generation and battery charge/discharge cycles; understanding the effects on both the seasonal peaks and the annual energy use; and considering the use of NWAs in solutions to load growth.

The DSP-LF application evaluates 8,760-hour DER, load and weather data, including future 8760-hour load, generation, and proposed system changes, and produces an 8,760-hour 90/10 forecast each year for 10 years into the future for feeders, substation power transformers, and substations.

1.1.2 Peak Load Forecasting Process

As described in Figure 1.2-A, the development of the peak load forecast is the first step in Pepco's distribution system planning process. The development of the forecast is a critical step, because it has

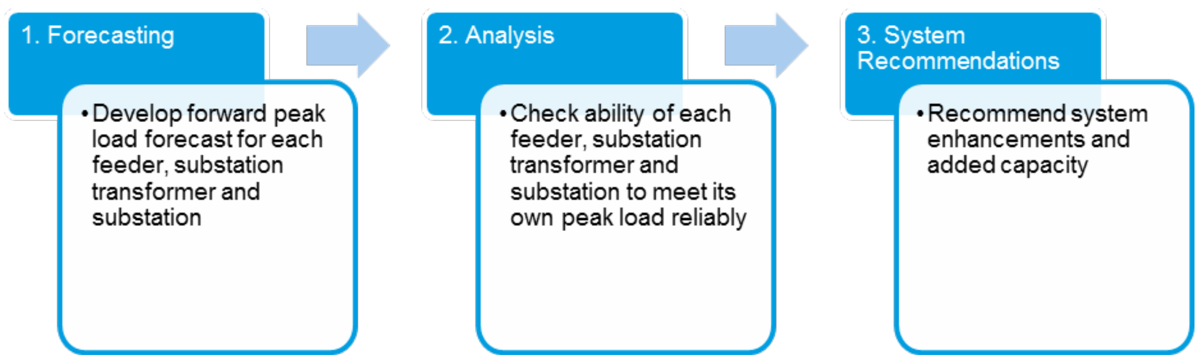
an impact on the outcomes of each subsequent step in the process and, ultimately, the timing and magnitude of the investments in the distribution system made by Pepco.[4] This section provides additional details on the analytical processes Pepco employs to develop its peak load forecast and the way in which DERs are incorporated into these processes.

[4] Consistent with PHI's regulatory obligations to provide safe, reliable electric service to its customers

It is important to note that Pepco must create more than just one peak load forecast. In fact, it creates many – one for each distribution feeder, individual substation transformer, and substation on its system. The creation of peak load forecasts for each distribution system component is needed to ensure that both individual system components are sized appropriately, and that the system as a whole will perform as it should.

This peak load planning process is depicted in the following figure:

Figure 1.1-A: General Planning Process for Distribution Feeders, Substation Transformers, and Substations

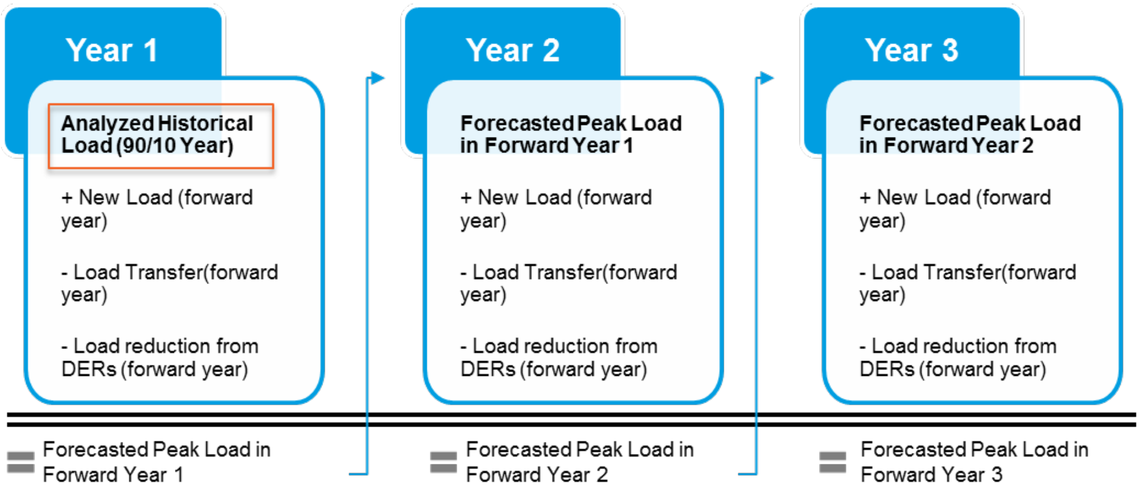


1.1.3 Short-Range and Long-Range Peak Load Forecasts

The peak load forecast is comprised of a short-range forecast for future years 1-3 and a long-range forecast for future years 4-10. This short-term forecast also serves as the basis for the development of the longer term 10-year plan. The former is a detailed, "bottom-up" analysis of historical peak load data, projected new load growth and energy reduction initiatives. The latter is a higher-level and "top- down" trending effort based on the PJM (the regional transmission operator or "RTO" responsible for maintaining the stability of the transmission system in Pepco's region) system peak load forecast. The short-range forecast is generally formulated in accordance with the calculation detailed in Figure 1.2-B[5].

[5] Specific circumstances may merit variations in this calculation process.

Figure 1.1-B: General Process for Creating Distribution Feeder, Substation Transformer, and Substation Short- Range Forecasts



For the purposes of this report, terms are defined as follows:

- **Analyzed Historical Peak Load** – This value serves as the base value from which future projections are calculated. This value is most often derived for each distribution system component by taking its actual historical peak load[6] in the hottest year within the last ten years,[7] and adding to it the incremental load changes (i.e., new loads, load transfers and load reductions from DERs) that have occurred between that hottest year and the year prior to the current year.[8]
- **New Load** – This represents additional new load that is anticipated to come online as a result of new building or development activities. At times and in some areas of Pepco's service territories, this value may be negative such as when an existing customer facility closes. New loads are

---

[6] As recorded within the SCADA and AMI systems.

[7] Pepco plans to the hottest year in the last 10-years to develop its peak loads for each distribution system component in the short-term load forecast. Pepco uses the 90/10 forecast produced by PJM as the basis of its long-range growth forecast in order to ensure that each utility has adequate system capacity to meet area load needs during seasons with extremely hot weather. The 90/10 forecast is produced by PJM to depict peak loading that has a 10 percent probability of occurring in any given year. For capturing peak historical loadings, Pepco's methodology uses actual load readings for each component during years of extreme (one in ten year) weather. For years when less than extreme weather occurs, Pepco uses the load of the latest extreme summer, making adjustments to the load to account for prospective new businesses (PNBs), load transfers, DERs and other factors. By employing this historical loading methodology, Pepco can seamlessly transition from the historical loads used to develop its short-term plan to the long-term forecast using the PJM 90/10 loads as the basis for the trend in growth. This process also assures that no peak load used for future planning is more than 10 years old.

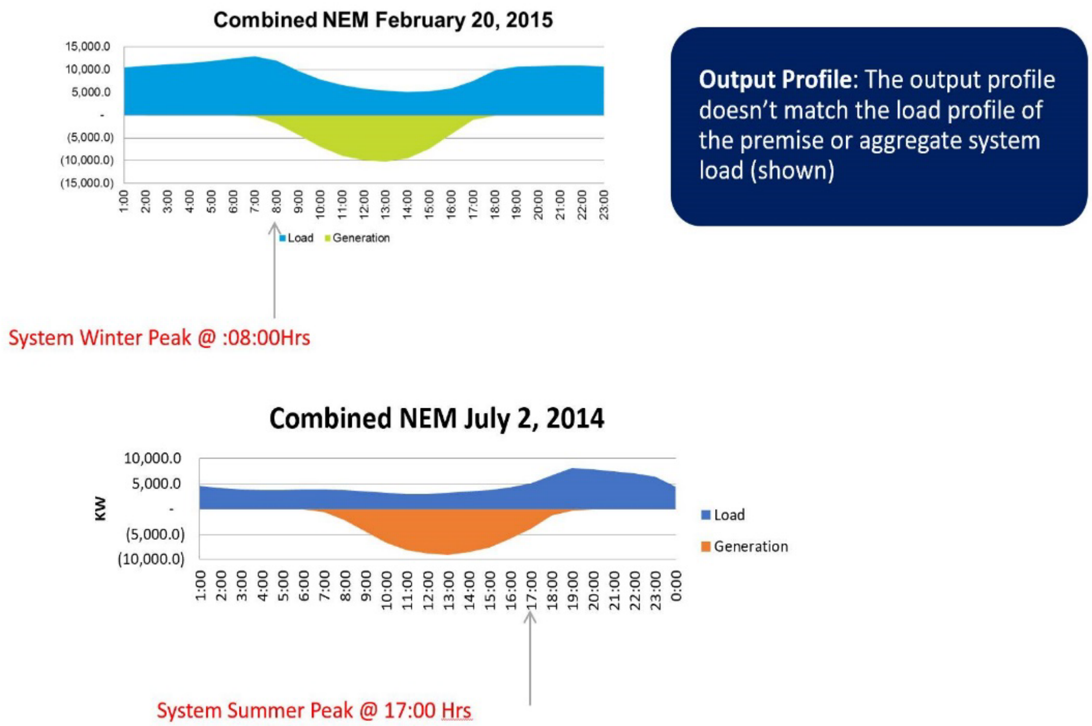
[8] On occasion, this method will result in a value that is less than the peak load encountered in the year prior to the current.This may occur because actual load growth on a feeder is greater than what Pepco would arrive at through its calculation (i.e., the addition of new load only from new build). In such cases, Pepco will use the actual peak load (i.e., via SCADA and AMI readings) from prior years as the Analyzed Historical Peak Load, to ensure that it is planning the distribution system to meet its maximum load requirement.

added at the anticipated level of load that Pepco expects a building of the same size and energy use would add to the distribution system.

- **Load Transfers** – These are projects that Pepco conducts to utilize available capacity in one portion of its distribution system to help meet a projected capacity shortfall in another part of the system. Such projects may include re-routing feeders from one substation to another or transferring a portion of one feeder to another feeder. These types of projects occur seasonally on the distribution system and are a way of managing load without undertaking more expensive upgrades or construction. Such projects are planned ahead of time and have an impact on the forecast in future years. As a result, these projects are accounted for in the process. These are permanent redistributions of load that must not cause a total projected load to exceed the normal rating of the component, as opposed to the contingency load transfers which occur during outages to help sectionalize and restore customers' service and can result in a component operating up to its emergency rating.
- **Load Reductions from DERs** – Distributed energy resources may, depending on their operation, reduce peak load. Whether or not these resources reduce peak load depends on the coincidence of the resource with the time of peak load on a particular distribution system component. The degree to which a DER contributes to a reduction in peak load depends on its output (which may be variable) and its contribution to total load at the time of peak load.

In addition, energy efficiency measures that are known are reflected in the historical loads that are being measured for each facility. Figure 1.2-C shows the effects of Net Energy Metering facilities on feeder peak loading.

Figure 1.1-C: Impacts of PV on Feeder Peak Loading



1.1.4 Long-Range Forecast

Upon completion of the short-range forecast, Pepco then completes the long-range forecast for years 4-10. Pepco's process for completing the long-range forecast generally occurs via the following steps:

1) Pepco first conducts a trending of the short-range forecast beyond its duration (within years 1-3) and into the window of the long-range forecast (years 4-10).
2) Pepco then adjusts this trending of peak load for each feeder, substation transformer, and substation for larger-scale system changes and factors that are known to be planned within the long-range forecast window. These changes may include considerations such as major long-term redevelopment initiatives within a geographical area
3) Finally, Pepco adjusts the projected year-by-year long-range peak load growth on each distribution system component such that the growth rate of the system-level peak load of Pepco's long-range forecast is reconciled with the rate of growth within the corresponding PJM long-range load forecast. Pepco reconciles the growth rate of its long-range forecast with PJM's 90/10 long-range forecast to ensure consistency across the planning process of the entirety of the power delivery system, inclusive of the distribution system under Pepco's purview and the transmission and generation systems under PJM's purview.

Pepco must plan for the reliable operation of each feeder, substation transformer, and substation at its individual peak load (MVA). These individual equipment peak loads generally do not coincide with one another and are thus generally referred to as being "non-coincident" peaks. Moreover, the sum of individual non-coincident equipment peaks generally exceeds the peak load demanded of the collective whole at any given time. In other words, Pepco must plan for its "non-coincident" peaks for each component of the distribution system while PJM must plan for the coincident peak that the transmission system is required to serve.

1.1.5 Feeder, Substation Transformer, and Substation Analysis Process

Once the peak load forecast is completed, Pepco analyzes the capabilities of each distribution system component to ensure that it can reliably meet its forecasted peak loads. Planners use the PNB and DER information gathered in the load forecasting process along with historical AMI customer load data, SCADA and electrical configuration information from Pepco's geographic information system (GIS) to model each feeder in its power flow analysis software. From this analysis, predicted system violations such as low voltage and thermal overloads are identified and resolved through the system recommendations process.

1.1.6 System Recommendations Process

Upon completing its analysis process, Pepco considers the specific predicted system violations to develop recommended actions, which may consist of:

1) Operational measures – Resetting relay limits, conducting phase balancing, or other measures;

2) Load transfers – Conducting field switching to transfer load from a higher loaded feeder to a lower loaded feeder;

3) Short-range construction projects – Feeder extensions, installation of capacitors or voltage regulators, reconductoring, NWA solutions; and

4) Long-range construction projects – New feeder extensions, new substation transformers or entirely new substations.

Once the recommended actions are identified, an area plan containing construction recommendations is issued.

1.1.7 Factors Guiding the Consideration of DERs in Pepco's Peak Load Forecast

DERs are considered in the peak load forecast and, therefore, are reflected in the entirety of the distribution planning process that follows. How or whether a DER is counted as providing a peak load reduction depends on the availability of that resource during the peak load time for the component of the distribution system being assessed. The magnitude of impact of a DER to be counted toward reducing load depends on the level to which that resource can be relied upon to provide a load reduction at that specific point in time when the peak load will occur on the component being assessed.

1.1.7.1 Availability of a DER at the time of Peak Load

A DER may or may not be available or in operation at the time of distribution feeder, substation transformer, or substation peak load. This is an important factor that has an impact on how the resource is considered in the peak load forecast, and ultimately the entirety of the planning process. The examples below illustrate some of the potential scenarios to be contemplated when incorporating DERs in the planning process:

- A customer completes an energy efficiency upgrade consisting of the installation of a new energy efficient air conditioning unit in place of an old unit – this would result in a permanent load reduction, and thus this DER (the EE upgrade)—if known to Pepco—would be fully available at the time of peak load on the distribution feeder, substation transformer, and substation from which this customer is provided service, and would thus be considered a resource that reduces peak load on these components.
- A commercial customer installs a large diesel generator that is run on occasion to supplement the customer's energy usage at the time of the customer's maximum energy demand, which occurs seasonally in mid-spring and not in the summer when the local distribution system experiences a peak load. Therefore, the diesel generator would not be a resource toward reducing peak load on the distribution feeder, transformer, and substation from which this customer is provided service.
- Several customers install small-scale residential solar systems on their roofs. In a given area, these DERs would be considered available at the time of peak load on the distribution feeder, substation transformer, and substation from which these customers are provided service. The total percentage of nameplate capacity considered to be available can be determined using a backcasting analysis that relates the hourly capacity factor9 of the DERs, the hour of the peak

[9] Capacity Factor is defined as the average power generated for a specified period of time divided by the rated nameplate power of the generating asset.

load on the component, and the total nameplate capacity on the component. Therefore, this would not be considered a firm resource counted toward reducing peak load on the distribution feeder, substation transformer, and substation from which this customer is provided service.

- A commercial developer installs a utility-scale battery system on a distribution feeder that is discharged during peak load periods on the transmission system. Therefore, most likely this would not be a resource counted toward reducing peak load on the distribution feeder, substation transformer, and substation from which this customer is provided service, because distribution system peaks do not necessarily coincide with the peak load on the transmission system.

In order to be considered as a planning resource, a DER must be "firm." In other words, it must be available at the time of peak load. Pepco's system planning criteria dictate that a DER is considered firm and is thus a dependable resource for peak planning purposes, if it is available (or coincides) 95% of the time with the peak on whichever component of the distribution system is being evaluated (feeder, substation transformer, or substation).

Planners, however, must also consider the consequences to the system when the DER is not available such as after restoration from a momentary or sustained power outage. For example, current industry standards and local electric codes mandate that all inverter-based systems (e.g., solar PV) automatically disconnect from the utility feeder upon loss of power.[10] When the feeder is reenergized, loading observed on that feeder is now the full load without the reduction from the solar generation until the inverters reconnect the customer PV back to the distribution system, which generally occurs after a minimum of five minutes. For planning purposes, the reduction from solar PV is added back into the loads of each distribution system component and those loads are compared to the emergency capacity ratings of the feeders and substation transformers and to the firm capacity rating of the substation. This Capacity Factor is defined as the average power generated for a specified period of time divided by the rated nameplate power of the generating asset.

This ensures that Pepco maintains adequate capacity during times when customer generation is unavailable, consistent with its regulatory obligation to provide safe, reliable electric service. Actions to be taken by the planners as a result of this analysis will depend on which component is overloaded and what actions that can be taken to mitigate the overload until the solar PV systems begin to generate and

[10] IEEE 1547.

reduce customer net loads. For example, if the only overload that exists is at the substation level, then restoration can be performed in stages to mitigate the risk of an overload and no further system enhancements would be needed.

Planners also consider the effects of distributed generation being offline during an outage event when automatic sectionalizing and restoration (ASR) schemes are operated through automated inline and tie switching devices. These ASR schemes are designed to automatically operate in order to isolate a fault during a feeder outage event and restore as many customers as possible. During the outage event, it is anticipated that all distributed generation on the affected feeder will have tripped off due to loss of utility power. Planners must analyze the potential transfers[11] to examine if the receiving feeder/substation transformer/substation can handle the extra load being transferred to it through automated switching. Planners design ASR schemes to maximize the amount of time during the year that there is adequate capacity to back-up an adjacent feeder.

1.1.7.2 Magnitude of Impact (kW) of a DER at the time of Peak Load

While some resources which meet the firm criteria are considered permanent load reductions (e.g., CVR, EMTs and other programmatic energy efficiency) additional analysis is required for other types of DERs to calculate the magnitude of the impact of the resource. This is particularly evident for variable generation sources such as solar PV. Over the course of a 24-hour period, hourly production of solar PV can range from 0% to 100% of nameplate capacity. Therefore, calculating the magnitude of the impacts requires considering several pieces of related information:

1) Actual or simulated production of the resource (in the case of distributed generation without dedicated metering and telemetry, a backcasting process is used to simulate production based upon conditions in a representative area);

[11] The total load to be transferred would be equal to the load that existed just prior to the outage plus the total available PV generation on the circuit. Once all load is transferred and customers are restored to service, the solar PV systems will be restored, and load will be reduced to pre-outage levels.

2) The amount of nameplate capacity of the DER interconnected to a distribution system component; and,

3) The hour and magnitude (MVA) of the peak for the distribution system component being evaluated.

1.1.8 Customer Growth Projections and Historical Comparisons[12]

Pepco's System Planning group forecasts electric load growth in order to plan for future additions to the electric system. Changes in the number of customers do not necessarily correspond to a similar change in load since neighborhoods containing specific types of customers may be redeveloped into ones containing different types of customers with different load characteristics. For example, former industrial zoned districts can be re-zoned to permit mixed use development. In addition, existing customers may increase their load, which has no effect on the customer count. Both new customer additions and increases in existing customer load are factors used in forecasting load growth. The increase or decrease in the number of customers can have an impact on system load. However, the more critical information is the amount of load that a customer uses. Thus, Pepco focuses on forecasting system load growth with future development and associated customer counts as an input.

District of Columbia customer counts for six years (2015-2020) are provided on a substation basis in Table 1.2-A. Substations have been assigned to District of Columbia wards based on their location rather than the area that they serve.

---

[12] In Order No. 12735 issued on May 16, 2003, the Commission directed (paragraph 139) the following:

> *139. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:*
> *(a) Customer growth projections by District of Columbia wards (including historical comparisons);*
> *(b) Load growth projections encompassing commercial and residential development by District of Columbia wards (including historical comparisons);*
> *The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.* In Order No. 12804 (paragraph 53) the Commission directed the following:
>
> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO:*
> *(a) Provide the projected zonal and projected default (i.e., SOS) load data for the District of Columbia to the PIWG on a quarterly basis as well as in the 2004 and subsequent PIPs;…*

1.1.9 Load Growth Projections and Historical Comparisons

Table 1.2-B provides six years of historical loads, and Table 1.2-C provides Pepco's projections for electric load growth in the District of Columbia for 2021 to 2030. The 33 substations listed in Table 1.2-B represent all the 13 kV distribution substations as well as the 4 kV substations not supplied by a listed 13 kV substation within the District of Columbia. Pepco tracks and projects load by substation. Substations have been assigned to one of the eight District wards based on the substations' locations rather than the area where they serve. Because feeders may cross ward boundaries, all feeders emanating from a substation will be assumed to supply load in the ward to which that substation is assigned.

The District has experienced uneven overall load growth from 2015 to 2020, as there are certain neighborhoods that have been growing relatively rapidly and other neighborhoods that have actually reduced load. Pepco attributes the reduction in loads to a marked increase in the number of customer owned photo voltaic (PV) solar generation connections and energy efficiency measures. Pepco's planning process examines historical load data on its substations and feeders, then examines PNB report data and internal and external reports regarding the load reductions due to DERs to develop a short-term forecast for each feeder and substation. Pepco uses trends developed in the short-term forecasting process combined with information about long-term neighborhood development projects and DERs to determine the long-term forecast for each feeder and substation. The trend analysis also takes into consideration energy efficiency activities that customers have supported during the past years and further uses AMI data from recently constructed buildings to refine expected loadings for new buildings. Developing energy usage trends will reflect these reductions in aggregate and are included in the decision-making process to determine when and where increased capacity is needed.

1.1.10 Incorporation of Field Information into the Planning Process[13]

Pepco's planning process incorporates equipment condition assessments (ECA) and other field information into its short-term and long-range plans, when applicable. The planning group creates long-range plans to upgrade or replace utility infrastructure evaluated to be approaching end-of-life.

The planning group is an active participant in ECA meetings and is the sponsor of substation transformer and switchgear replacement projects. The planning group participates in decision making regarding actions to take when equipment is evaluated to be near end-of-life, including whether to replace the equipment in kind or through a new capital project. The decision depends upon how close to failure a piece of equipment is evaluated to be, what other load-driven or reliability-driven capital projects are in the area, and the age and condition of other equipment in the substation.

---

[13] Order No. 16975 states the following at paragraphs 89 and 116:

> *89. Decision: The Commission believes that OPC's recommendation has merit. However, we understand that equipment condition assessments may be included within the distribution system planning process, as shown in the description of the Pepco Planning Process provided by OPC at "Existing System Analysis." We direct Pepco to explain in the 2013 Consolidated Report the extent to which field information is considered within "Existing System Analysis."*
>
> *116. Pepco is DIRECTED to provide field information consistent with paragraph 89 herein;*

Notes: All substations supply 13.8kV of primary power unless otherwise noted.
Loads shown are actual readings taken during peak summer conditions.
Totals shown are the sum of undiversified peak loads and are not meant to be used as official Pepco system peak loads.
Trends shown are based on the straight line regression of the loads and include transfers amongst the substations.

Power Factors and Energy Loses[14]

Power Factors

The power factor provides one measure of how efficiently Pepco's electric system is being used. Substation load has two components: real power (kilowatts) and reactive power (kilovars). Real power is the power that serves the customers' end-use electrical devices. Reactive power does not serve customer requirements but decreases the substation's ability to deliver real power and increases system losses. This reduced ability to deliver real power is based on a substation's power delivery limitations. The power delivered is a combination of reactive and real power, so the greater the reactive power, the lower the real power that can be delivered. As the system power factor approaches unity, real power delivered is greater and system losses due to reactive power are reduced. By making appropriate use of capacitors, the reactive power flow on the electric system can be reduced such that it approaches zero. (When the reactive power flow is zero, the power factor is unity (*i.e.*, 1.0).) A unity power factor would be ideal and would result in the maximum usable power being delivered to the customers. However, a unity power factor is not technically or economically practical to maintain because of changing loads and system conditions.

Pepco plans for a 98% (.98) power factor or higher on its 4 kV and 13 kV distribution substations at

[14] n Order No. 10133 (at 10 and 12), the Commission directed Pepco to include performance factors relating to the transmission and distribution (T&D) system in future PIPs.By way of compliance with the above requirements, in the September 1993 PIWG Meeting, Pepco proposed reporting performance data on its 13 kV distribution substation power factors.

the summer peak. Table 1.2-F below provides the percent of all Pepco's 4 kV and 13 kV distribution substations that had power factors ≥ 91% at the summer peak hour for the years 2011 - 2020. In 2020, 90% of the 4 kV and 13 kV substations had a power factor of ≥ 0.91 at the summer peak hour.

Annual System Energy Losses[15]

Table 1.2-F shows a ten-year comparison of annual system energy losses for PJM and adjacent utilities. 2010 through 2019 were obtained from the Federal Energy Regulatory Commission (FERC) web site. All data are from FERC Form 1. A comparison of annual system energy losses over the past ten years is provided for PJM utilities and utilities adjacent to the Pepco service territory. Pepco's system energy losses for 2019 are 4.52% or approximately 17% lower than the group average of 5.28%.

% Annual System Energy Losses:

$$\text{\% Annual System Energy Losses} = \left(\frac{\text{Total Energy Losses (FERC Form 1, Line 27, page 401a)}}{\text{Total Energy (FERC Form 1, Line 28, page 401a)}} \right) \text{X } 100$$

[15] Industry comparison of annual system energy losses is presented in Table 1.2-G.

ADJACENT UTILITY

Substation Additions and Enhancements[16]

The discussion below updates the information provided in the 2020 Consolidated Report. All planning data is based on current information and may be revised as the Company completes final designs, fully evaluates site conditions, receives permitting and zoning requirements and receives final contract and equipment bids. This information could impact both the costs and timing of a project. Costs presented reflect forecasts based on approved budgets and include related transmission, distribution, real estate, and permitting costs. Plans associated with the L Street Substation have been removed from this list as they are being rolled into the long-term Downtown Resupply plan described below.

Table 1.2-H reflects Pepco's planned substation additions and enhancements for the District of Columbia with their anticipated in-service dates based on current data and analysis as well as

[16] In the 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (page 266 of the hearing transcript):
But what we were talking about here yesterday was that the comprehensive plan would include… any rebuilt substations you might have; any new substations you might have…
Moreover, Order No. 16975 states the following at paragraphs 50 and 101:
50. Decision: …Consequently, we require Pepco to include a report on substation additions and enhancements in future Consolidated Reports. In addition to the information provided in the 2012 Consolidated Report, the Commission requires that Pepco provide details concerning the justification for these projects, including, as applicable, load growth projections and equipment age and condition in future Consolidated Reports.
101. Pepco is DIRECTED to provide a report on substation additions and enhancements consistent with paragraph 50 herein;

approved budgets. In-service dates are, therefore, tentative and are adjusted as in-service dates become nearer.

Table 1.2-H: Substation Additions and Enhancements

#	Project Cost	Project Description	Projected In-Service Date	Areas Served
2	**$138.6 million**	**Mt. Vernon Square Sub.** – Build new substation to relieve predicted network overloads.	June 2023	NoMa, Mt. Vernon Triangle, Shaw
3	**$191.7 million**	**Harvard Sub. –** Upgrade Harvard as a new 230/13 kV substation to retire existing Harvard and Champlain substations.	June 2024	Columbia Heights, Adams Morgan
4	**$151.9 million**	**Champlain Sub. –** Upgrade Champlain as a new 230/69/34 kV substation to resupply downtown distribution substations.	December 2027	Downtown

Justification of Substation Additions and Enhancements

The new substation at Mt. Vernon Square is needed to provide capacity to the redeveloping Mt. Vernon Triangle and Shaw areas. The capacity improvements at the Harvard Substation are needed to replace aging infrastructure at the Harvard and Champlain Substations and to create capacity to serve the growing Columbia Heights area. The new upgraded substation at Champlain will be used to re-supply existing L Street, F Street, and Georgetown substations with new solid dielectric feeders. Pepco has also projected capacity constraints and, thus, a potential need for a load-driven substation in the 2026-2028 timeframe in the St. Elizabeth's and Columbian Quarter area of Ward 8. Future ACRs will discuss this project in more detail and as its load continues to develop.

1. **Construct New Mt. Vernon Square Area Substation (2023 Load Relief Project)**

Overview: This project consists of constructing a new 230/13 kV substation with an ultimate capacity of 210 MVA near Mt. Vernon Square. It is currently planned to initially have three 230/13 kV transformers for a firm capacity of 140 MVA. This substation will provide distribution capacity to the rapidly redeveloping area in and around the Mt. Vernon Triangle. Initially, approximately 58.0 MVA of load would be transferred from the Northeast Sub. 212 Southwest LVAC Network Group and Tenth Street Sub. 52 radial distribution in 2023.

Load Projections:

Facility: Northeast Sub. 212 Southwest LVAC Group

Summer Summer Rating = 50.0 MVA

	2020 History	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated
Net Load Forecast (MVA)	35.5	43.4	47.5	49.2	53.4	56.3	57.5	59.0	61.5	63.0	64.5
Cumulative DER Impacts since 2011	0.6	0.6	0.6	1.4	1.4	1.4	1.4	1.4	1.4	1.4	1.4

Facility: Northeast Sub. 212

Summer Summer Rating = 214.0 MVA

	2020 History	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated
Net Load Forecast (MVA)	141.3	173.3	194.3	207.2	217.8	223.7	230.3	235.6	236.6	237.6	238.3
Cumulative DER Impacts since 2011	1.6	1.8	2.0	3.2	3.3	3.3	3.4	3.5	3.6	3.7	3.8

Magnitude of Load: Initially, approximately 58.0 MVA of load would be transferred from the Northeast Sub. 212 Southwest LVAC Network Group and Tenth Street Sub. 52 radial distribution in 2023.

Justification: The new Mt. Vernon Substation will provide relief to the Northeast Sub. 212 Southwest LVAC Network Group, which is expected reach 98% its firm capacity in 2023 and exceed its firm capacity approximately 7% in 2024. Northeast Sub. 212 is expected to be at 97% of its firm capacity by 2023. Due to space limitations in the streets around the Northeast substation, no new feeder groups can be extended to relieve these overloads.

Long-term growth exceeding 140 MVA is expected to come into service in the Mt. Vernon Triangle, NoMa, and Capitol Crossing areas over the next 8 years. This currently includes over 15,000 apartment type residential units, 1,300 hotel rooms, 2.5 million square feet of retail space and 6.5 million square feet of office space.

Total Planned Capital Investment (Includes A & G): $138.6 million

Current Status: In design stages.

In-service Date: June 2023.

Alternative: There were several alternatives provided by Pepco in Formal Case No. 1144, including to delay the construction of the facility until 2024. To facilitate this specific alternative, a series of cascading load transfers are required to relieve Northeast Sub. 212 using Florida Avenue Sub. 10. This alternative is not practical due to load proximity. The feeders being extended from Florida Avenue Sub. 10 will be less reliable due to length and would reduce area operating flexibility as Florida Avenue Sub. 10 and the other area substations will all be loaded near their full capacity.

Multiple sites were evaluated for locating the proposed Mt. Vernon Square Sub. An alternative substation location was investigated along New York Avenue in Northeast DC. It was determined that the primary amount of development and load center of the new substation was in the Mt. Vernon Triangle area. Several sites were investigated in the Mt. Vernon Triangle area, but alternatives were rejected as too expensive or not offering required access to the nearby streets.

2. Upgrade Harvard Sub. 13 (2024 Aging Infrastructure Project)

Overview: This project consists of removing the current 34kV/13kV substation at Harvard Sub. 13 and upgrading to a new 230/13kV substation with an ultimate Firm Capacity of 210 MVA. It will initially have three 230/13kV transformers resulting in a Firm Capacity of 140 MVA. The upgraded Harvard Sub. 13 will serve all 13kV load supplied from the existing Harvard Sub. 13 and will provide capacity to enable the transfer of load from Florida Avenue Sub. 10 and partial load from Champlain Sub. 25. The remaining load of Champlain Sub. 25 will be transferred to Florida Avenue Sub. 10, allowing for the transition of that facility from a distribution substation to a re-built subtransmission substation . The upgraded Harvard Sub. 13 will also provide capacity for future load growth in the Columbia Heights and Adams Morgan areas.

NOTE: Changes to the original plan for transferring all load of Champlain Sub. 25 to new Harvard Sub. 13 are due to feeder routing limitations discovered during field investigations.

Load Growth Projections:

Facility: Harvard Sub. 13

Summer Rating = 39.0 MVA

	2020 History	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated
Net Load Forecast (MVA)	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Cumulative DER Impacts since 2011	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0

Magnitude of Load: During construction of the new Harvard substation, all load currently supplied from the existing Harvard Sub. 13 in 2020 will be transferred temporarily to nearby substations. After the upgraded Harvard Sub. 13 is placed in service, partial load from Florida Avenue Sub. 10 and Champlain Sub. 25 will be transferred to it. The remaining load supplied from Champlain Sub. 25 will be transferred to Florida Avenue Sub. 10, allowing for the transition of Champlain from a distribution substation to a new subtransmission substation.

Identified Need: This project is needed to retire aging infrastructure including Harvard Sub. 13 13 kV substation originally constructed in 1907, the 34 kV supplies to Harvard Sub. 13 from Buzzard Point Sta. "B", constructed around 1960, and Champlain Sub. 25 13 kV substation, constructed around 1954. This upgraded substation will also supply capacity to the growing Columbia Heights and Adams Morgan areas.

Justification: Harvard Substation 13 was initially built in 1907 with the substation having undergone several refurbishments with the latest taking place in the mid-1960s. The 34kV supplies to Harvard Substation 13 were constructed in the 1940s. The last incarnation of Champlain Substation 25 was put into service in the mid-1950s although some portions of the site are likely older. The substation does not meet Pepco's current standard for fault current withstand and are configured in a non-standard way that could lead to longer restoration times for failures experienced inside the substation. In addition, completion of this project along with the project to resupply L Street Sub. 21 (Downtown 34-69kV Resupply) and the retirements of Anacostia Sub. 8 and Navy Yard Sub. 33 will enable the retirement of Buzzard Point Sta. B 13/34 kV substation. The upgraded Harvard substation will provide capacity to accommodate projected load growth in the Columbia Heights area.

Total Planned Capital Investment (Includes A & G): $191.7 million (overall estimated cost of project increased due to inclusion of historic landmark nomination, demolition and civil engineering costs).

Current Status: In design stage

In-service Date: June 2024

Alternative: The alternative to rebuilding the Harvard Substation would require construction of a new 210 MVA, 138/34 kV substation near Buzzard Point, from which three (3) new 34 kV "radial" underground circuits would be extended approximately 5.3 miles to the Harvard Substation. All existing equipment would be upgraded at the Harvard Substation; however, the capacity of the substation would remain at 80 MVA. Upgrading the Harvard Substation would require replacement of individual transformers and switchgear. This alternative would cost more overall than the selected alternative and would not increase overall substation capacity as much as the selected alternative. Pepco currently does not have adequate substation capacity in the area to transfer the entire load from the Harvard and Champlain Substations to other substations.

3. Upgrade Champlain Sub. 25 to 230/69 kV substation (2027 Aging Infrastructure Project)

Overview: This project consists of removing the current 69 kV/13 kV substation at Champlain Sub. 25 and upgrading to a new 230 kV / 69 kV substation with an ultimate capacity of around 570 MVA. It will have three 230 kV / 69 kV transformers with room for a fourth 230 kV / 69 kV transformer. From the upgraded Champlain Sub. 25, four new 69 kV supplies will be extended to serve F Street Sub. 74 and Georgetown Sub. 12. The supply feeder replacements for F Street Sub. 74 and Georgetown Sub. 12 are recommended so the existing, aged, fluid self-contained 69 kV supplies from Potomac River Sta. C can be retired. These feeders have had increasing maintenance issues over the past several years. The new 34 kV supply feeders to L Street Sub. 21 from Champlain are recommended to retire the existing 34 kV feeders from Buzzard Point which restrict the firm capacity available at L Street Sub. 21.

Load Growth Projections:

Facility: F Street Sub. 74

Summer Rating = 82.0 MVA

	2020 History	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated
Net Load Forecast (MVA)	45.7	46.7	46.7	46.7	46.7	46.7	46.7	46.7	46.7	46.7	46.7
Cumulative DER Impacts Since 2011	0.3	0.4	0.4	0.5	0.6	0.6	0.7	0.8	0.8	0.9	1.0

Facility: Georgetown Sub. 12

Summer Rating = 134.0 MVA

	2020 History	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated
Net Load Forecast (MVA)	121.5	120.6	120.7	120.8	120.8	120.9	121.0	121.1	121.1	121.1	121.1
Cumulative DER Impacts Since 2011	1.7	1.8	1.8	1.8	1.8	1.9	1.9	1.9	1.9	1.9	1.9

Facility: L Street Sub. 21

Summer Rating = 62.0 MVA

	2020 History	2021 Anticipated	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated
Net Load Forecast (MVA)	40.3	43.2	43.2	43.2	43.2	43.2	43.2	43.2	43.2	43.2	43.2
Cumulative DER Impacts Since 2011	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2

Magnitude of Load: Approximately 211 MVA of load will be served from the upgraded Champlain Sub. 25 as the existing F Street Sub. 74, Georgetown Sub. 12 and L Street Sub. 21 will all be supplied from new 69 kV feeders extended from Champlain.

Identified Need: This project is needed to retire aging 69 kV supply feeders to Georgetown Sub. 12 and F Street Sub. 74 and the aging 34 kV supply feeders to L Street Sub. 21.

Justification: The last incarnation of the Champlain Substation was put into service in the mid-1950's, although some portions of the site are older. Further, many of the Champlain Substation's air circuit breakers were installed in 1960 and 1976. The Champlain Substation's transformers were installed in 1954. While Pepco's inspections have found that this equipment is in good condition due to Pepco's ongoing maintenance programs, it is all operating well beyond its recommended lifespans. In addition, the feeders are all over thirty years old. The 69 kV supply feeders are "self-contained" type cables, meaning that there is fluid contained inside the cable jacket for cooling purposes. There have been an increasing number of maintenance problems with this cable which require extended time and resources to resolve due to limited material availability and few contractors with expertise repairing this type of cable system. This increases customer outage risk as the feeder needs to be taken out of service for extended periods of time while repairs are made.

The new 69 kV supplies to L Street Sub. 21 will replace the solid dielectric and gas filled cables that are at least 30 years old. In addition, resupplying L Street will allow for the retirement of the Buzzard Point 13 kV and 34 kV substations, the former of which was originally built in the 1930's as a generating station. Another benefit of replacing the feeders is that the firm capacity at L Street will significantly increase.

Total Planned Capital Investment (Includes A & G): $151.9 million. The increase in cost is due to the inclusion of costs associated with Takoma Sub. 500MVA phase shifters.

Current Status: In the early design stages.

In-service Date: December 2027

Alternative: The alternative to rebuilding the Champlain Substation would require replacing the three existing 69 kV supply feeders from the Takoma Substation (5.4 miles) to Champlain Substation. The Champlain Substation would still need to be rebuilt, and, in addition, Pepco would need to build a new downtown substation. The new downtown substation would require the purchase of additional land. A new downtown substation would require extending three 230 kV "radial" underground circuits a total of approximately 5.0 miles from the Takoma Substation to the new downtown substation.

1.1.11 Distribution Projects[17][18]

Overhead and Underground Distribution Projects[19]

Pepco's overhead and underground distribution project budgets over the past six years are provided in Table 1.2-I.

Table 1.2-I: Historical Routine Overhead and Underground Distribution Projects

Pepco DC 2014 - 2020 Capital Budgets (Dollars in Millions)							
Distribution	**2014**	**2015**	**2016**	**2017**	**2018**	**2019**	**2020**
Customer Driven	$53.0	$55.4	$67.2	$68.7	$71.3	$85.4	89.3
Reliability	133.7	127.5	121.2	114.8	157.6	176.0	197.8

[17] In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (pages 266-267 of the hearing transcript):
But what we were talking about here yesterday was that the comprehensive plan would include… anything that you might envision to account for distribution load growth…
[18] Order No. 16975 states the following at paragraphs 51, 52 and 102:
51. Staff Recommendation #7: Continue to provide annual updates of on-going and planned OH and UG distribution projects driven by customer, reliability, and load considerations in future Consolidated Reports. Include budget as well as actual spending for each of the three categories and explanation of significant differences in actual versus budgeted amounts…
85. Decision: The Commission adopts recommendation #7, noting that Section 1.2.4 of the Consolidated Report does not contain a comparison of actual vs. budgeted spending, nor does it include an explanation of any variances. Pepco is therefore directed to include this information in future Consolidated Reports. 102.Pepco is DIRECTED to continue providing updates of on-going and planned overhead and underground distribution projects consistent with paragraph 52 herein;
[19] In Order No. 12735 issued on May 16, 2003, the Commission stated the following at paragraphs 74 and 135:
74. During the November 2001 hearings the Commission requested that PEPCO submit a comprehensive plan to include a current assessment of, and future plans for, its underground distribution and network facilities.179 The Commission requested the plan as a tool to evaluate PEPCO's planning methodology and to assess PEPCO's ability to anticipate and respond to changing conditions in its underground distribution system…

135.PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:
(c) Listing of underground distribution projects, such as the Adams-Morgan neighborhood project (including budgets, time schedules, and expected benefits) by secondary vs. primary system by District of Columbia wards affected, but not specific locations;
The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Load	36.4	51.8	45.0	20.4	71.9	62.9	71.9
TOTAL	$223.1	$234.7	$233.4	$203.9	$300.8	$324.3	$359

Pepco's overhead and underground distribution project budgets for the next five years are provided in Table 1.2-I. In developing forecasts, system planners review each component of the existing electric system, along with requirements for new service hook-ups, to develop the costs and schedules for changes to the electric system. Results are then proposed as candidates for inclusion in the construction budget process, which takes place during the second half of each year. The construction budget process culminates with the approval of the following year's budget and the selection of projects to be included in the budget and four-year forecast of electric system additions. Projects may be added or deleted from the budget and four-year forecast from year to year as required. The summary budget and four-year forecast for overhead and underground distribution projects, which identifies types of projects and their respective budgets and forecasts for the years 2020 through 2024, is provided as Table 1.2-J.

Table 1.2-J: Planned Overhead and Underground Distribution Projects

Distribution Construction	2021	2022	2023	2024
Customer Driven	74.68	80.08	71.99	81.18
Reliability	245.25	241.83	285.30	252.28
Load	84.22	49.48	70.95	55.80
TOTAL	404.15	371.39	428.24	389.25

Note: Pepco only prepares a four-year forecast. Potential emergency restoration work is included in the Reliability budget and forecast. Prospective work for the DC PLUG initiative has been included in this plan.

Section 1.1.12

Pepco's overhead and underground distribution project variances for 2020 are provided here in Table 1.2-K, in accordance with Order No. 18644.

Table 1.2-K: Routine Overhead and Underground Distribution Project Variances

Pepco DC 2020 Capital Budget Variances (Dollars in Millions)			
Distribution Construction	**2020 Budget**	**2020 Actual**	**Variance**
Customer Driven	$89.3	$86.7	($2.6)
Reliability	197.8	173.8	($24)
Load	71.9	39.3	(32.6)
TOTAL	$359	$299.9	($59.1)

SECTION 1.2 – MAINTAINING SYSTEM RELIABILITY

Pepco is committed to maintaining a safe and reliable electric distribution system and has programs in place that advance the operation of the electric distribution system by increasing the capabilities to monitor and analyze the performance of its system and enhance the ability to determine where to make modifications and additions to replace poorly performing equipment. Pepco monitors the performance of its distribution feeders system-wide. This process is performed annually and enables Pepco to analyze and determine the relative ranking of each feeder's performance from the least to the most reliable.

This section of the Consolidated Report addresses:

- Technology: Monitoring, Automation, and Information Systems;
- Equipment Standards and Inspections;
- Vegetation Management (VM) Program Detail;
- Industry Comparisons;
- Best Practices; and
- Storm Readiness.

1.2.1 Technology: Monitoring, Automation, and Information Systems

Systems and Technology[20]

The discussion below addresses the Company's technology initiatives that contribute to improved reliability performance.

1.2.2 SCADA[21]

The System Control and Data Acquisition (SCADA) System is the primary tool used by the System Operators to monitor and operate the electric system. This system provides the System Operator at the Control Center the ability to remotely monitor and operate all major equipment at all substations and selected equipment outside of the substations. It is through this system that the System Operator learns what is happening across the electric system and has the ability to take appropriate actions to maintain a safe and reliable system and restore service during outages.

The Remote Terminal Unit (RTU) at each substation gathers data from all substation monitored equipment and provides an interface to pass the data to the central computer system, Energy Management System (EMS), and to the System Operator, who can then remotely control devices at each substation. Major equipment status (open or closed) and equipment metering (watt, var, voltage and ampere) is monitored by the Operator. Additionally, there are specific equipment alarms that indicate abnormal conditions like high temperature, low oil pressure or overloads on a particular device or feeder.

Pepco maintains its own extensive communication system that allows for direct communication between the RTUs at the substations and the computer system at the Control Center.

The computer system at the Control Center gathers the data from all the RTUs, analyzes the data, displays results to the System Operators, and provides the interface for the System Operator to remotely operate the system to protect equipment. Any change of electric system status at the

---

[20] In Order No. 12804 paragraph 53 E, the Commission ordered the following:
53. The 2003 PIP is hereby APPROVED, provided that PEPCO:
(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

[21] The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001, at page 313.

substation is displayed to the System Operator within approximately 4 seconds. The system also provides various analyses. For example, it provides an indication if any substation equipment exceeds its capability limits. It does this by comparing the design limit of the equipment with the present loading. Through the SCADA system automatic switching activities can be performed or the System Operator can take action manually to protect remote system equipment and relieve the condition that caused the equipment to be operating outside of its limits.

All raw data from the SCADA system (meter values and status changes) are retained and made available to those areas (System Planning, Distribution and Engineering, etc.) that need the data for analysis. The available data consists of meter values (watts, vars, volts and amps) and status (open and closed) of various facilities, equipment and feeders.

1.2.3 Substation Automation[22]

Although all 13 kV substations have full SCADA control, some 4 kV substations have only limited monitoring capability and do not have the full RTU capability that provides remote control and operation. At these substations all equipment status indications are grouped together on a substation basis and when there is a change of status, a single alarm point provides a single substation alarm indication. Personnel are dispatched to the substation to determine the specific problem. A project is underway to install full RTU capability in the Company's 4 kV substations that are not scheduled for conversion and retirement by installing smart relays on all critical equipment. This will provide for improved restoration capability and hourly data for analyses.

The following is the schedule for substation automation as currently planned:

- Macarthur Boulevard Sub. 152 (Q1 2022)
- Texas Ave Sub. 111 (Q2 2022)
- Fort Dupont Sub. 58 (Q3 2022)
- Fort Davis Sub. 100 (Q4 2022)

---

[22] Substation Automation and the following section, Distribution Automation, are also addressed in Sections 2.3.2.1 and 2.3.2.3, respectively, as PIP Projects.

In addition, conventional electro-mechanical relays are being replaced with new generation Smart Relays. Additional information provided by these relays is allowing for more effective and efficient operation. In certain applications, the smart relays can provide information with respect to the distance from the substation to the fault on the feeder. This will allow for faster troubleshooting of system problems, improved restoration capability and increased data for system analyses.

1.2.4 Distribution Automation (DA)

As part of the DA projects, eighteen 13 kV substations have been equipped with upgraded Smart Relays and enhanced RTUs for improved visibility and control at these locations. Additional information provided by these relays will allow for more effective and efficient operation and will support the operation of the Automatic Sectionalizing and Restoration (ASR) system being installed at each location. The following eighteen13kV substations, which supply load within the District of Columbia, have been equipped with enhanced RTUs and upgraded Smart Relays:

- 12th & Irving Substation
- Alabama Ave Substation
- Benning Substation
- Fort Slocum Substation
- Harrison Substation
- Little Falls Substation
- NRL Substation
- Van Ness Substation
- Beech Rd Substation (located in MD but serves some DC customers)
- Bladensburg Substation (located in MD but serves some DC customers)
- Grant Ave Substation (located in MD but serves some DC customers)
- Green Meadows Substation (located in MD but serves some DC customers)
- St. Barnabas Substation (located in MD but serves some DC customers)
- Takoma Substation (located in MD but serves some DC customers)
- Tuxedo Substation (located in MD but serves some DC customers)
- Walker Mill Substation (located in MD but serves some DC customers)
- Linden (located in MD but serves some DC customers)
- Wood Acres (located in MD but serves some DC customers)

Projects are underway to install additional 13 kV and 69 kV remotely operated switches on feeders in addition to the feeders associated with the ASR systems. The additional switches will allow more capability to isolate the faulted portion of the feeder and return more customers to service sooner. The remote-control capability of these switches allows the System Operator to perform switching without the need for field crews, thus reducing customer outage time.

Pepco has completed the installation, testing and integration of the network transformer remote monitoring system (RMS) on 53 network transformers in Buzzard Point network group, 86 network transformers in Sub 161 south group, 72 network transformers in Sub 18 Central group, 78 network transformers in Sub 212 South group, 61 network transformers in Sub 212 Southeast group, 56 network transformers in Sub 25 Central group, 59 network transformers in Sub 52 South group, 79 network transformers in Sub 52 West group, 29 network transformers in Sub 6 North group, 61 network transformers in Sub 7 Central group. Pepco has planned to complete the rest of 48 network transformers in Sub 6 North group in 2021.

These monitors will provide increased visibility and control capability for system operators to remotely open or close the network transformer protectors through two-way communications. Load, voltage, protector status, and equipment condition data are recorded for study and operating purposes, and for increased ability to schedule maintenance of this equipment. RMS will provide operational data to evaluate the performance of the transformer and protector, allowing Pepco to perform maintenance when needed and not just on an interval-based inspection schedule, and allow remote operation of the protector to disconnect network load from the transformer without the need to wait for a crew to manually operate the protector. This will provide great benefits during emergencies when there is a need to isolate a transformer very quickly from the network. The development of the RMS system and the initial installation at Buzzard Point were part of the Department of Energy Smart Grid Investment Grant (SGIG) that the Company received. The installations of RMS on these networks are part of the Company's long-term plan to install RMS in all of its 49 networks, which contain approximately 4,000 transformers.

1.2.5 Outage Management System (OMS)[23]

The OMS is the primary tool used to receive customer trouble reports, analyze reports, and provide summary reports for crew dispatching. Typically, the process starts with the customer reporting an outage

[23] In Order No. 13422 on the 2004 Consolidated Report, paragraph 66, the Commission ordered the following:
66. The 2004 Consolidated Report: Productivity Improvement Plan and Comprehensive Plan is hereby APPROVED, provided that PEPCO:
(a) Report in the 2005 Consolidated Report, due February 15, 2005, on the corrective actions taken to fix the OMS;

by calling the Pepco Call Center or from an Advanced Metering Infrastructure (AMI) meter reporting the loss of power. Information from that call or meter report is entered into the OMS system. The OMS database has the customer information, including customer phone number, address, and connected transformer. Additionally, the database contains the electrical network configuration of each feeder connecting each transformer to a feeder and the location of switches, fuses and taps. The system then analyzes all reported trouble by sorting the reports, prioritizing and grouping multiple problems to a common source. The analyzed data are then displayed to the System Operator for dispatch of crews to investigate and resolve the problem.

The SCADA system also provides input to the OMS. When a feeder breaker at a substation opens and the entire feeder is out, all customers connected to that feeder are known to be out of service. Information obtained from customers (pole struck, line down, tree limb on wire, etc.) in the OMS is then used to determine the source of the problem and to dispatch crews. For trouble involving these pieces of equipment, the customer trouble calls provide the data necessary to determine the problem. The OMS analyzes all the customer calls as well as AMI meter statuses and then determines the common source of the problem. Information is also passed back through the OMS to the Call Center to provide that information to the customer when they call in or review their account online. This information includes knowledge of current trouble and estimated restoration time under non-major storm outage conditions. No significant changes or additions were made to Pepco's OMS system in 2020.

1.2.6 Information Systems

<u>Asset Suite 8</u>

AS8 is the system used for construction, engineering, scheduled preventative maintenance and corrective work management at Pepco. Asset data is also maintained in the system. It is closely integrated with the Graphical Work Design (GWD) system and two new scheduling systems, Primavera P6 and Syntempo. AS8 replaced Pepco legacy systems WMIS and SAP in early 2019. They are still available in read-only mode for reference.

Primavera P6

Primavera P6 is the primary tool for T-Week scheduling for construction, engineering, and plant maintenance (preventative and corrective) work at Pepco and is closely integrated with the Asset Suite 8 and Syntempo systems.

Syntempo

Syntempo is the primary tool for underground New Business work at Pepco and is closely integrated with the Asset Suite 8 and Primavera P6 systems.

GIS/GWD System

Pepco continues to deploy new functions offered by the GIS vendor for greater use of GIS data throughout the company, primarily in the area of data visualization and easier access to GIS data across the organization. The GIS/GWD system continues to be Pepco's official database of field assets. The Exelon utilities are discussing and evaluating the roadmap for GIS technologies among each company in the coming years.

1.2.7 Power Delivery Information System Projects[24]

Pepco's Power Delivery Information System Projects are provided in Table 1.2-A. Included in Table 1.2-A are historical information system projects for the years 2016 - 2020. All costs are for those allocated to the District of Columbia.

---

[24] In Order No. 12735, paragraph 139, the Commission ordered the following:
PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:…
(d) Listing of power delivery information system projects with implementation schedules, annual costs, and milestones;
(e) Listing of new technology investigations with decisions, annual costs, and implementation schedules;
…The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Table 1.2-A: Historical Information System Projects

Rollup-1	Estimated DC Portion 2016	Estimated DC Portion 2017	Estimated DC Portion 2018	Estimated DC Portion 2019	Estimated DC Portion 2020
ROLLUP ($000s)					
Customer Systems	782	2,295	10,634	4,544	5,734
Smart Grid Systems	514	585	1,594	1,792	1,561
Meter Systems	0	0	0	0	74
Network Operating Center (NOC)	6	80	1	0	0
Energy Supply Systems	35	0	0	0	0
Operations Systems	102	1,176	1,147	143	765
Energy Management System (EMS)	1,298	742	2,023	2,301	4,200
Engineering Systems	260	33	38	422	680
Field technologies	0	133	0	0	0
Work Management	315	1,763	7,233	2,951	3,626
Planning and Performance	0	80	255	548	1,214
Subtotal IT Capital (DC Portion)	**3,312**	**6,886**	**22,925**	**12,701**	**17,855**

Note: List does not include Smart Grid meters, Smart Grid communication network, distribution automation, or Telecom.

Equipment Standards & Inspections

Equipment Inspections[25]

A proactive inspection and monitoring program reduces the possibility of unexpected failures and secondary damage to surrounding units, and increases the opportunities that Pepco can plan for the replacement of impending problem equipment. The frequency of inspections and monitoring is based on Pepco's experience, manufacturers' recommendations, and/or industry practices. Inspections may lead to repair or replacement of transmission and distribution system components to maintain safety and reliability of the system.

Inspection and modeling activities identify equipment to be replaced due to loading or condition. Distribution line equipment such as transformers, cable, and other components are not subject to detailed electrical testing and are replaced only when physical inspection indicates a need for replacement. Other than those inspections, equipment is replaced when it is upgraded, relocated or fails.

[25] In Order No. 16091, paragraphs 63 and 46, the Commission ordered the following:
63. Pepco is directed to provide a description of its maintenance policies and methodologies, consistent with paragraph 46 of this Order;
46. Decision. … we shall require that Pepco provide a list of the types of equipment for which a "run to failure" method applies and those for which a preventive method applies. (Footnote: If other maintenance methods are used, Pepco shall describe them as well.) The Commission requires that Pepco provide an explanation of why different maintenance methods apply to different types of equipment. We also require a description of the "test procedures" that Pepco uses to assess the performance and remaining life of the equipment. (Footnote: See Pepco comments at 7.) Further, Pepco shall provide an estimate of the current book value of equipment maintained under each method used by Pepco. The 2011 Consolidated Report shall include this description of maintenance policies and methods.\

As new technologies are installed, actual operational data will be available to better analyze the loading and performance of equipment. For example, load data from the AMI system can potentially identify overloaded transformers prior to failure.

Table 1.3-B below provides a range of inspection or maintenance cycles for different classes of equipment. These were developed by weighing factors such as criticality, duty cycle, varying manufacturer's recommendations, and technological differences.

The equipment types and asset groups listed on Table 1.3-B have been designated as either a "preventive" or a "predictive" maintenance. It should be noted that Pepco views its overall

maintenance methodology to be defined by "reliability-centered" practices, with predictive and preventive methodologies to be subsets of this reliability-centered focus

Table 1.3-B: Equipment Inspections

Equipment	**Inspection**	**Periodicity**	**Maintenance Methodology**
Substation	General Inspection	Every 2 months	Preventive
Substation Power Transformers	Predictive Maintenance Routine	Annually	Predictive
	Oil Collection and Analysis of Transformer Main Tank and Load Tap Changer (LTC)	Once a year or more frequently if triggered by the Equipment Condition Assessment (ECA) Process, or criticality of transformer	Preventive
	Routine Inspection and Test	Every 4, 8, or 16 years based on criticality, or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
	LTC Filter Change	Where applicable and condition-based maintenance on high filter differential pressure	Preventive
	Routine Cooler Inspection	Annually	Preventive
Substation Capacitor Banks - Metal Enclosed	Routine Inspection	Annually or more frequently as recommended by Equipment Condition Assessment Process	Preventive
Substation Capacitor Banks - Open Rack	Routine Inspection	Annually or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
Substation Capacitor Banks - Open Rack with Circuit Switcher	Routine Inspection	Annually or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
	Predictive Maintenance (PDM) Tasks	Annually	Predictive

Substation Circuit Breakers – Air Magnetic	Routine Test	6 Years or more frequently as recommended by Equipment Condition Assessment Process.	Preventive

Equipment	**Inspection**	**Periodicity**	**Maintenance Methodology**
Substation Circuit Breakers – Oil	Oil Collection and Analysis Of OCB	Every 1, 2 or 3 years based on criticality, or more frequently as recommended by Equipment Condition Assessment Process	Predictive
	Predictive Maintenance (PDM) Inspections	Annually	Predictive
	Internal Inspection and Test	3 – 4 Years, or more frequently as recommended by Equipment Condition Assessment Process	Preventive
	Diagnostic Testing	3 Years	Preventive
	Compressor Inspection/Pre-Charge Inspection (as applicable)	2 Years	Preventive
Substation Circuit Breakers – SF6	Predictive Maintenance (PDM) Inspections – Non-intrusive	Annually	Predictive
	Routine Inspection – Intrusive	Single Pressure: 8 Years, Dual Pressure: 4 Years, or more frequently as recommended by Equipment Condition Assessment Process	Preventive
	Diagnostic Testing	Single Pressure: 8 Years, Dual Pressure: 4 Years, or more frequently as recommended by Equipment Condition Assessment Process	Preventive
Substation Circuit Breakers – Vacuum	Predictive Maintenance (PDM)	Annually	Predictive
	Routine Inspection	6 Years or more frequently as recommended by Equipment Condition Assessment Process	Preventive
Substation – 69 to 230kV High-Pressure Pipe-Type Potheads	Periodic Inspections where sample ports are available.	Every 4 to 6 years (230kV),	Preventive
		Every 6 to 8 years (115kV),	Preventive
		Every 8 to 10 years (69kV)	Preventive
Substation – Battery & Charger Systems	Visual & On-line Test/Inspection	Annually or more frequent as recommended based on an ECA.	Preventive
Substation – Building Heating, Ventilation and Air Conditioning (HVAC) System	Annual Inspection	Annually	Preventive

Equipment	Inspection	Periodicity	Maintenance Methodology
Substation – Emergency Generators	Start and Run Test	Up to 4 times per year: Routine Inspections; Annually: Standby Generator Inspection and Maintenance and Black Start Generator Test Inspections as recommended based on equipment condition.	Preventive

Equipment	Inspection	Periodicity	Maintenance Methodology
Substation – Fire Protection	Routine Inspection	Annually	Preventive
Right-of-Way Integrated VM (Transmission)	Routine Inspection	Interval based on Right-of-Way inspections and height of vegetation.	Preventive
Scheduled Tree Trimming - Overhead Distribution Feeders Not In Transmission Rights- of-Way	Routine and Condition-based Tree Inspection	4 Year trim cycle	Preventive
Protective Relays and Automatic Reclosing Relays	Preventive Maintenance	4 to 8 years based on system voltage class	Preventive
Under-Frequency Relays	Preventive Maintenance	8 years	Preventive
RTUs - SCADA	Predictive Maintenance	Failure to operate properly based on condition monitoring – self diagnostics, EMS trouble logs, real	Predictive
SCADA (Supervisory Control and Data Acquisition) Metering	Preventive Maintenance	Condition based maintenance	Preventive
Digital Fault Recorder	Preventive Maintenance	200kV and Above: 8 Years, Below 200kV: Failure to operate properly based on condition monitoring-self diagnostics, fault records, real time data analysis and remote communications.	Preventive
Power Line Carrier (PLC)	Preventive Maintenance	Every 24 Months	Preventive
Microwave Equipment	Preventive Maintenance	Every 24 Months	Preventive
Fiber Optic Equipment	Preventive Maintenance	Condition Based Maintenance	Preventive
Leased Line	Preventive Maintenance	Every 24 Months	Preventive

Equipment	Inspection	Periodicity	Maintenance Methodology
Pole-Type Recloser	Routine Inspection	Visual: 2 years Operational Test: Every 3 to 6 yrs.	Preventive
Pole-Type Regulators	Routine Inspection/Test	Every 24 months	Preventive
Critical (Hospital/Nursing Home) Network Transformers/Protectors	Routine Inspection	Every 3 years	Preventive
Distribution Manholes	Routine Inspection	Every 6 years	Preventive

Equipment	Inspection	Periodicity	Maintenance Methodology
Underground Network Transformers/Protectors	Routine Long Inspection	Every 5 years de-energized (Staggered w/Short Inspection so visits are 2.5 years apart). Inspection cycle for some locations may differ and be between 2 - 10 years based on: 1) criticality - hospital locations are inspected more frequently; 2) location type - sidewalk/roadway location or roof top/basement; and 3) installation type - junction	Preventive
Capacitor Banks – Pole Mounted	Routine Inspection	2 Years for Non-Distribution VAR Dispatch (DVD), DVD capacitors monitored near real-time.	Preventive
Distribution Pad mounted Transformers / Switchgear	Routine Inspection	5 Years	Preventive
Pipe-Type Cable Joint Sleeves in Manholes	Periodic Inspection	Every 5 to 10 years	Preventive
Wood Poles	Wood Pole Inspection, Remedial Treatment and Restoration	Every 10 years (starting in 2015)	Preventive
Power Line Over Navigable Waterway – Overhead Clearance	Routine Inspection	5 years	Preventive
High Voltage Transmission Structure Aviation Warning Lighting	Periodic Inspection	Annually	Preventive
High Voltage Transmission Structure Grounding	Periodic Inspection	Inspect Grounding System on a 5 – 10 year interval	Preventive

Equipment	Inspection	Periodicity	Maintenance Methodology
Microwave Tower and Aviation Warning Lighting	Periodic Inspection	Annual or as per Federal Aviation Administration(FAA)	Preventive
High Voltage Transmission Line Comprehensive Inspection	Aerial Inspection	6 Years	Preventive
Cathodic Protection	Substation Inspection and Manhole Survey	Condition based – Various intervals (based upon type of work involved)	Preventive
Cable Oil and Gas Alarms	Annual Inspection	Annually	Preventive
Fluid Pressurizing Plants for High- Pressure Pipe-Type Cables	Operational Test and Inspection	Every 1 to 2 weeks (chart replacement), Every 1 to 2 years (operational test)	Preventive

Table 1.3-C includes the book value of equipment as of December 31, 2020. Book values have been categorized by direct and allocable plant. The use of FERC Mass Asset Accounting does not allow any specific asset to be identified and linked to its accumulated depreciation and remaining useful life or to link it to the maintenance method applied to the equipment as assets are depreciated by account.

any specific asset to be identified and linked to its accumulated depreciation and remaining useful life or to link it to the maintenance method applied to the equipment as assets are depreciated by account.

Overhead Feeder Inspection Program [26]

Pepco's Overhead Feeder Inspection Program was initiated in 2012 to improve overall system reliability and remediate potential safety issues. In the years since the initial inception, the Overhead Feeder Inspection Program has been refined to facilitate more aggressive inspection timelines and prioritization for remediation activities that addresses the criticality of infrastructure issues and is consistent with typical feeder improvement work.

Overhead Feeder Inspection Cycle

Pepco's Overhead Feeder Inspection Program ensures that all feeders with overhead exposure are inspected within a two-year period. Pepco currently has approximately 200 District of Columbia feeders with overhead exposure.

Overhead Feeder Inspection Components

The overhead feeder inspection consists of a mobile scan of all main line poles on a feeder, from ground line to the top of the pole, including the conductors from pole to pole, utilizing Ultrasonic and Infrared Non-Destructive Testing (NDT) methodology.

---

[26] Order No. 16975 states the following at paragraphs 64 and 107:
64. Decision: Pepco is directed to report on the Overhead Feeder Inspection Program in future Consolidated Reports as recommended by OPC and the Staff, including results of the inspections, actual and incipient failures detected and remediation actions taken to correct the nonconformance items recorded. In particular, as requested by OPC, Pepco is directed to report on replacement of lightning arresters.
107.Pepco is DIRECTED to report on the Overhead Feeder Inspection Program consistent with paragraph 64 herein;

Visual inspection is performed on all feeder mainlines to determine feeder/equipment condition and identify immediate threats to reliability created on the following equipment:

- Cross-arms and braces
- Insulators
- Grounds
- Lightning arrestors
- Conductors
- Transformers
- Reclosers
- Capacitors
- Regulators
- Ancillary equipment
- Vegetation

Overhead Feeder Inspection Results

Overhead feeder inspection results required remediation work and completion status are tracked. Prioritization of remedial work is based on both safety and reliability attributes. Immediate or near-term response is assigned to those conditions that must be addressed to mitigate imminent safety or reliability issues. Less emergent conditions are required to be remediated within the typical design and build cycle for distribution projects. Conditions that do not pose a reliability or safety threat in neither the near-term nor long-term, are identified for possible upgrade in conjunction with other planned work.

Repairs or upgrades to correct or eliminate conditions observed during inspections are scheduled under the following guidelines.[27]

- Priority 10: A condition where upon inspection, a Pepco facility is deemed to present an imminent safety hazard to utility personnel and/or the public. In this case, steps shall be taken to immediately eliminate the hazard. Inspectors are required to immediately notify Pepco and to stand by until relieved by Pepco personnel.
- Priority 20: A condition where upon inspection, a component of an overhead feeder is observed and confirmed to pose a threat to service reliability but does not pose a direct public safety threat. Conditions under this category should be remediated within 90 days.
- Priority 30: A condition where damage or degradation exists on a component of an overhead feeder line, does not pose a direct public safety threat, and if left uncorrected, has the potential to affect service reliability under adverse system conditions. Conditions under this category should be remediated within 18 months.
- Priority 40: A condition that poses no threat to safety or reliability but does not conform to current Pepco standards. Conditions under this category should be corrected when other work presents the opportunity to bring the condition to current standards.

---

[27] See APPENDIX 3B - MANHOLE INSPECTION PROGRAM (MIP) for a details of Exelon Utilities Corrective Maintenance Prioritization system.

Overhead Feeder Inspection Cycle:

Pepco inspects approximately half of its overhead feeders every other year resulting in a full inspection cycle being completed every two years.

Overhead Feeders Inspected 2020

In 2020, 101 District of Columbia feeders were inspected as part of the Overhead Feeder Inspection Program. Sixty-one (61) conditions were identified.

2020

1.2.8 VEGETATION MANAGEMENT PROGRAM DETAIL

Each year, Pepco's system reliability is impacted by trees and tree branches that have contacted, fallen on, or otherwise interfered with poles and wires, causing disruption of service. Due to the density of tree coverage in Pepco's District of Columbia service territory and public concerns relative to tree pruning, challenges exist when balancing the value of trees to customers and communities and the need for reliable electric service. The main objectives that the Vegetation Management (VM) program attempts to balance are safety, reliability, regulatory compliance, environmental stewardship, and customer satisfaction. Pepco's VM program includes tree pruning, tree removal, maintaining access and tree planting.

Pepco's VM priorities are:

- Achieving and maintaining a high degree of reliability across the entire electric system;
- Targeting areas of the electric system found to be most susceptible to outages and damage from trees;
- Performing cyclical pruning to maintain the stability of the system;
- Working with local stakeholders and property owners in the removal of hazard trees in close proximity to Pepco's electric lines;
- Communicating with customers through various media;
- Performing emergency tree and limb removal from electric lines; and
- Assuring that the VM work is performed consistently with good environmental stewardship.

Pepco's VM program in the District of Columbia includes:

- Scheduled two-year cyclical maintenance or routine scheduled pruning and removals;
- Planting of trees to mitigate the impact of VM work;
- Unscheduled (non-cycle) maintenance operations; and
- Selective application of herbicide.

Pepco's VM process can be summarized in the following steps:

- Establish an annual VM plan strategy in accordance with regulatory requirements, International Society of Arboriculture (ISA) Best Management Practices and Pepco VM goals;
- Plan Work – Inspect the feeder to develop a VM work plan that defines the work to be performed;

- Prune/Remove/Clear Trees – VM personnel engage qualified contractors and perform project management and contract administration to complete feeder maintenance as planned;
- Validate completion of work plan – Certified Arborist inspects to validate that work performed is completed in accordance with plan and American National Standards Institute (ANSI) standards; and
- Document and report progress.

Scheduled Pruning

Pepco's scheduled cycle tree maintenance program in the District of Columbia includes a comprehensive inspection by an ISA Certified Arborist to develop a work plan for each feeder on a two-year cycle in accordance with guidelines established in conjunction with the District of Columbia's Urban Forestry Administration (UFA) and American National Standards Institute (ANSI) standards, and International Society of Arboriculture (ISA) Best Management Practices (BMPs).

Coordination with:

DC Urban Forestry Administration (UFA) and others

The UFA is responsible for the management of the majority of public space trees that grow in proximity to Pepco overhead facilities. UFA also administers the tree protection laws and is responsible for issuing permits for tree removal on private property. Arborists from Pepco and UFA work to identify and eliminate hazardous tree conditions during cycle and unscheduled maintenance operations. Pepco also coordinates with natural resource managers from the National Park Service, the District of Columbia Department of Parks and Recreation, and private property owners.

Despite the good working relationship between Pepco and UFA, challenges remain, especially with respect to VM work associated with "legacy" trees. District of Columbia statutes and regulations from decades ago resulted in "legacy trees" that impact operations today and have historically limited the degree and technique of vegetation cutback from Pepco power lines. This has resulted in large trees growing through and in close proximity to conductors. Examples of the policies include the following:

1. Section 13 of "An Act for the Preservation of the Public Peace and the Protection of Property within the District of Columbia," approved July 29, 1892. (27 Stat. 324; District of Columbia Official Code § 22-3310) (Emphasis added.)

1892: *"An act for the preservation of the public peace and the protection of property within the District of Columbia" …unlawful for any person willfully* ***top****, cut down, remove, girdle,* ***break, wound, destroy, or in any manner injure*** *….any tree not owned by that person…"*

2. Policy produced by District of Columbia, June 9, 1960, "Trees in Public Space: Washington, DC," at pg. 17.

   1960: *"Utility lines must be cleared by the use of directional clearance methods only…..the removal of internal branches to permit passage of utility lines through the trees where necessary"*

Many of the older trees conflict with the Pepco distribution system such that the issues with the various trees cannot be resolved without cutting entire "legacy" trees down. No standardized practice or agreement currently exists to resolve these conflicts. Pepco continues to work with UFA to resolve these issues on a case-by-case basis and in accordance with the Vegetation Management Plan for Utility Tree Pruning – District of Columbia (2005 Plan).[28]

In 2016, the Urban and Forestry Protection Act of 2002 was amended." The 2016 changes heightened the requirements to obtain permits to remove private trees. A "Special Tree Permit" is required to remove private trees as small as 13.9" diameter and the fee increased by 63%.

Mitigation and Tree Planting Programs

Pepco's tree planting funding mitigates removals and promotes "Right Tree Right Place" best management practices around utility space. In 2020 Pepco planted 344 trees in the District of Columbia and contributed $8,294 to the DC Tree Fund (in the form of special tree removal permits).

Selective Application of Herbicide and Tree Growth Regulators

Pepco's VM program includes the use of herbicide and tree growth regulators. An herbicide plan is developed each year to control brush and sprout growth where trees have been previously cleared. Herbicide applications are used selectively on rights-of-way, easements and, when granted

[28] The 2005 Plan was produced as a result of a tree-trimming working group including members from the District Department of Transportation's Urban Forestry Administration and Pepco's Vegetation Management team. Pepco filed the 2005 Plan on March 17, 2005 in Formal Case No. 982.

permission, on private property, throughout the Pepco system in the District of Columbia. The use of herbicides follows a systematic approach with the aim of reducing woody stems from growing in the utility space. Herbicides and growth regulators used on Pepco's ROW are extremely low in toxicity and are biodegradable. Most herbicides affect treated plants by inhibiting the production of chemicals which plants need to produce chlorophyll, or by inhibiting the formation of leaf-buds. Without chlorophyll production, or functional leaves, the treated plant exhausts its stored food supply and dies.

Tree growth regulators reduce the cell elongation of trees, which can help to extend the cycle time that we need to return to prune a tree again. Only herbicides and growth regulators registered by the U.S. Environmental Protection Agency (EPA) and D.C. Department of Environment are applied in strict accordance with the label and under the regulation of United States Department of Agriculture (USDA). Pepco contract applicators are supervised by certified commercial pesticide applicators.

Customer Communication Materials

- Provide consistent notification to customers regarding Pepco's VM activities on their property and in their community;
- Provide information to customers explaining the VM program along with a schedule of trim and contact information;
- Make available Pepco forestry representatives to respond to inquiries as work is being done and scheduled;
- Encourage customers to access the Pepco website for more detailed educational material including links to ANSI A330 standards, Utility Arborist Association, and the "Right Tree, Right Place" program under the Arbor Day Foundation;
- Enable the planners to meet with customers and local officials, or correspond through mail, e-mail, and phone as needed;
- Enable work permits to be obtained in advance of scheduled work to allow work to continue in a coordinated and planned manner;
- Participate in community meetings; and
- Coordinate public awareness of Pepco's VM activities and programs through the use of door hangers that are placed on customer's door prior to start of VM work.

Customer Communications: VM

See Attachment A for an example of the Company's 2020 customer communications, which is an example of pertinent information that is relayed to customers as bill inserts and other means of communication.

Industry Comparisons[29]

The Industry Comparisons section contains industry comparisons of transmission and distribution operations and performance. The comparisons of reliability indices are provided in Figures 1.3-A through 1.3-C in response to Commission directives in Formal Cases No. 766 and 982.

Institute of Electrical and Electronics Engineers (IEEE) Benchmarking Survey Results

Each year, Pepco participates in the annual Transmission and Distribution System Benchmarking Study conducted by IEEE. Although Pepco's District of Columbia service territory did not participate separately in the study, the Company has calculated separate values for Pepco's District of Columbia territory in both 2019 and 2020, using the MSO reporting criteria and has indicated both of these reliability results on the following charts. Note that Pepco's 2020 reliability results that are reported in the following graphs are not directly comparable to the data used in the 2019 study. See Figure 1.3-A through Figure 1.3-C.

[29] In Order No. 15568 paragraph 57, the Commission ordered the following:
57. Pepco IS DIRECTED to provide a report on the Electric Utilities Best Practices, consistent with Paragraph 50 of this Order. This report shall be included in that 2010 Consolidated Report; and shall include the best practices of the electric utility industry on improving reliability and outage restoration (from the Benchmarking Studies). Pepco shall submit a continuous improvement plan, including resourcing, specific performance targets, and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparable) utilities in the Benchmarking Studies.

Best Practices

Implementation of Twenty Best Practices[30][31][32][33]

Pepco continues to follow the best practices discussed in the 2019 Consolidated Report. The status, maturity/implementation levels, and staffing impacts remain unchanged.

Approximate Costs Attributable to the District of Columbia

Regarding the costs of implementing best practices, Pepco must provide the following explanations:

---

[30] In Order No. 16091 paragraph 61, the Commission stated the following:
61. Pepco IS DIRECTED to include a "2011 Best Practices Report" in its 2011 Consolidated Report describing its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program, consistent with Paragraph 22 of this Order;
22. Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568. Second, as to the Staff's Recommendation that Pepco file a "Best Practices Report" from the PA Consulting's 2009 Polaris Transmission and Distribution Benchmarking Program, we agree that a report may be helpful in assuring that best practices continue to be implemented. Therefore, the Commission shall require that Pepco include in its 2011 Consolidated Report a section entitled "2011 Best Practices Report" in which Pepco shall describe its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program included in the 2010 Consolidated Report as Appendix 2D. The twenty best practices selected by Pepco should be those judged to have the most impact on reliability and outage restoration performance. Pepco shall report on all its activities during 2010 to implement these best practices, including data on staffing levels, expenses and results. This requirement is separate from the requirement to produce a "Continuous Improvement Plan," as is described more fully in Section IV.A.1.f.

[31] In Order No. 15632 issued in these proceedings, the Commission states at paragraph 5 the following:
5. Pepco shall file with the Company's annual Consolidated Reports to the Commission data on the Company's measures to continue to address each of the recommendations made by PA Consulting and the effectiveness of the Company's approaches to improve CAIDI and SAIDI to at least the average of

[32] Order No. 16623 states the following at paragraphs 29 and 52:
29. Decision: The Commission agrees with the Staff that the information provided in the 2011 Consolidated Report does not allow a complete assessment of Pepco's progress in implementing the twenty "best practices." Therefore, we direct Pepco to provide further information for each "best practice," including staffing levels, expenses and schedules and percentage of completion. In those cases where no incremental expenses or staffing occurred, we require Pepco to identify the other activities with which these best practices were combined "for efficiency" and provide expenses and staffing levels associated with those activities. In order to provide a comparative analysis, we require Pepco to provide budget vs. actual expenses and staffing levels for the period 2007 to 2011. We also require Pepco to provide an assessment of the progress it has made in fully implementing each best practice. In addition we require Pepco to identify whether and how each best practice has been incorporated within its Comprehensive Reliability Plan.96 This information shall be included in the 2012 Consolidated Report.
52. Pepco is DIRECTED to prepare a report on best practices consistent with paragraph 29 herein;

[33] 35 Order No. 16975 states the following at paragraphs 85 and 114:
85. Decision: The Commission finds that Pepco has failed to comply completely and explicitly with the requirement that it identify "whether and how each best practice has been incorporated within its Comprehensive Reliability Plan." While Pepco includes some of its best practices as part of the REP, it does not discuss each best practice, as required by Order No. 16623. The Commission agrees with OPC that "including these practices within the REP would be an effective means for improving reliability." Pepco is required to fully address the role that each best practice has in the REP in its 2013 Consolidated Report and in future Consolidated Reports. If a best practice is not part of the REP, then Pepco shall explicitly state that fact.
114.Pepco is DIRECTED to address the role each best practice has in the Reliability Enhancement Plan consistent with paragraph 85 herein;

1. **Cost allocation across companies and jurisdictions:** Many of the activities associated with the best practices described herein are performed by centralized teams supporting all PHI companies or teams supporting Pepco system-wide. Budgets and expenditures of departments that serve all of PHI are not directly attributable to one jurisdiction or another.
2. **Redirection of resources:** The implementation of some best practices by these teams did not necessarily require additional resources, but rather either required the allocation of additional duties or a shift in duties from previous practices to the newly identified best practices. Further, activities supporting the best practices are only a subset of all work done by these departments, and the activities of many of the primary personnel involved in executing and advancing these best practices are allocated to general overhead accounts.
3. **Reported best practices costs:** The Company has attempted to allocate estimated resource hours and associated activity-based costs in these centralized functions to the District of Columbia where possible. (See Table 1.3-D.) Where defined expenditures for process and reliability improvement exist, Pepco cites these expenditures in the attached table.

Table 1.3-D: Approximate Costs Attributable to the District of Columbia

			Approximate Costs Attributable to District of Columbia											
			2015		2016		2017		2018		2019		2020

ECA Teams[34][35][36]

A discussion of costs and benefits, as required by Order No. 16975, is provided below.

ECA driven projects generally consist of planned projects to replace large, high cost, long lead time primary components within substations. Targets for these projects are usually selected by condition-based criteria such as dissolved gas in oil analysis. However, due to certain external drivers (such as load, location, environment, and system criticality), these replacements may also be triggered by historic performance of a component. These projects are primarily driven by Pepco's need to manage contingency risk and do not result from cost / benefit analyses. Replacements are usually in-kind or upgrades and depend on component availability at the time. System emergencies can alter the prioritization of these projects.

The utility's obligation to serve requires substation design criteria which provides redundancy and risk management. Although substation component failures are rare in comparison to feeder components, the loss of a critical substation asset could result in long term outages affecting thousands of customers. The provision of redundant components, backup sources, and minimization of single points of failure in substation designs reduces this risk and generally allows Pepco to perform routine maintenance and upgrades without the need for planned outages. This redundancy also allows Pepco to manage contingencies and continue service despite the loss of a major substation component. As such, substation reliability is maintained by keeping both the primary and redundant assets in good working condition. Therefore, condition and criticality of assets predominantly drives substation reliability programs and many projects in the substation reliability category do not directly translate to improvements in outage frequency and duration. This concept is known as Reliability Centered Maintenance (RCM), the principles

[34] Order No. 16975 states the following at paragraphs 39 and 98:
39. Decision: …Specifically, the Commission directs Pepco to report on the recommendations and actions taken by the ECA team, including membership lists, meeting dates and minutes, analyses of impact of the ECA team on maintenance or replacement policies and asset management strategy and tactics. We also require Pepco, to the extent not already included, to report on costs for recommended equipment replacements and the projected benefits of those replacements, as OPC suggests. Further, the Commission directs Pepco to provide an explanation of how the work of the ECA team relates to other Pepco reliability initiatives and include a discussion of the equipment failure analysis as part of future years' Consolidated Reports.
98. Pepco is DIRECTED to include a report on the results of its Equipment Condition Assessment work consistent with paragraph 39 herein;

[35] The ECA minutes have been modified in response to the Commission's directive "to include a brief description of the project status *(i.e*., whether it is deferred, completed or ongoing)," *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 231 (February 27, 2015).

[36] Order No. 19119 also addressed the ECA minutes and directed Pepco and OPC to file comments on potential elimination and/or changes to the content of the ECA information presented in the ACR. The Commission has not yet issued a final order on this matter.

of which dictate that predictive maintenance activities serve to identify failing assets prior to catastrophic failure.

Substation assets are inspected under various inspection programs, including visual, infrared, and oil sampling where applicable. Based on observed condition and potential system risk, assets are cleared for normal duty, scheduled for closer monitoring, scheduled for maintenance, selected for immediate replacement, or added to prioritized programmatic replacement programs, as appropriate. Pepco's ECA process is the vehicle used to identify substation assets for condition-driven replacement in order to maintain the reliability of the substation. The ECA process cooperatively analyzes major equipment condition, makes major repair / replace decisions utilizing various subject matter experts and through consensus, prioritizes candidates for replacement on a quarterly basis.

Substation assets such as transformers, breakers, and larger components typically have long lead times and must be ordered well in advance (months to years) of anticipated need. For this reason, a number of replacement projects are kept in the project pipeline at any given time. This allows Pepco to substitute one project for another in situations where long lead times would subject the system and customers to significant reliability risk. Projects are engineered and built using standard designs and approved equipment.

Generally, substation reliability projects cannot be translated into measurable or forecasted SAIDI or SAIFI benefits. The presence of redundant systems within substations reduces or eliminates the direct threat to customer reliability from the loss of a single asset. However, the failure of such assets reduces the security of supply to feeders and elevates the risk of large-scale customer outages. Given the potential for customer impacts along with the long replacement cycle of major substation assets, Pepco replaces these assets proactively based on condition assessment and the desire to manage such contingency risk.

A summary of the four quarters of ECA meetings for 2020 are included below. The format has been changed to summarize the data while retaining requests for greater clarity regarding timing, costs, and completion of projects

Pepco-DC Region Equipment Condition Assessment

Meeting – 1st through 4th Qt. 2020

Principle Project Outage Coordinator	PEPCO System Operations

1.2.9 STORM READINESS

Pepco's mandate is to provide safe and reliable electric service. This is the basis for all Company contingency operations, including storm restoration, and is the foundation for the storm restoration objective of safely restoring electric service to the greatest number of customers in a minimum amount of time. The Pepco District of Columbia Major Service Outage Restoration Plan (MSO Plan) uses these principles to assess damage across the entire Pepco service area and to establish restoration guidelines for preparedness, pre-storm planning, storm response, communications, and post-storm evaluations.

The PHI Crisis Management Plan and the MSO Plan necessarily modify the normal corporate organization, in accordance with the National Incident Management System's (NIMS) Incident Command System structure and manages this amended structure to accomplish storm restoration and emergency response. The Pepco Regional Incident Management Team (IMT) assigns personnel to this temporary structure to efficiently restore customer service. The overall governing principle of the Pepco IMT is to match resources to restoration requirements. The Pepco IMT is flexible in order to adjust resources to the various types of restoration efforts that may be required and to enable restoration activities to be prioritized to restore the largest number of customers first across Pepco's service territory. All Company resources, including Operations, Logistics, Planning &Analysis, and Finance and Administration are dedicated to customer service and the storm restoration effort.

Each branch of the Pepco IMT has the ability to expand or contract staffing for the response effort as necessary. Storm positions are activated based on the support or response functions required for efficient restoration. Pre-established storm duties are maintained for each storm position. The Staging Area branch of the IMT is activated under unique circumstances. The increased number of customer calls during storms requires additional staffing at the Customer Operations Call Center to answer customer inquiries and to supplement the automated entry of customer outage information. In the event of a major storm, Pepco's High-Volume Call

The increased number of customer calls during storms requires additional staffing at the Customer Operations Call Center to answer customer inquiries and to supplement the automated entry of customer outage information. In the event of a major storm, Pepco's High-Volume Call Answering (HVCA) System can be activated to takes the high volume of outage calls Pepco expects in the immediate aftermath of a major storm. This HVCA system is capable of answering more than 100,000 calls per hour to reduce the incidence of busy signals and hold times and is most efficient in the early stage of the restoration process. Once the initial outage reports are in, the Company has the ability to disable the automated call system and staffs the Pepco call center with additional employees who are trained to assist call center representatives in handling the increased volume of calls. All areas in the Customer Care Group, in performing their second roles, are required to provide support to the Call Center. Additional personnel across the Company provide assistance through their incident response role assignments and help to relay accurate information between customers and operations

Communication requirements for internal as well as external groups are identified in advance, planned for, and monitored for effectiveness during storm response. Accurate, timely and coordinated communications provide a vital link in the restoration response. Approximately 48 hours in advance of a significant major storm with predicted multi-day outages, Pepco notifies customers who are enrolled in Pepco's Emergency Medical Equipment Notification Program so they can prepare to implement their contingency plans in the event of power outages. Pepco also notifies regulatory and government officials and emergency management agencies of its storm preparations and to discuss any special concerns. Operational communications coordinate field restoration activities. Communication roles in the PHI Crisis Management Plan and the MSO Plan provide for a proactive and flexible communication strategy.

The Storm Restoration Objectives are to safely restore electric service to the largest number of customers in a minimum amount of time. This requires advance planning and pre-storm preparation. Advance planning during non-storm conditions enables operational readiness for restoration activities. In addition to drills and exercises designed to lead employees through a variety of emergency scenarios, Pepco also works with local emergency management agencies and a cross-section of community, government and business leaders in a collaborative effort to review restoration plans and practices to develop more effective ways to improve Pepco's response.

In addition, Pepco actively pursues a public education and awareness campaign that includes initiatives such as the "Weathering the Storm" brochure. These publications and additional brochures contain information about the Company's Emergency Medical Equipment Notification Program, tree trimming, and portable generator safety, all of which are available upon request as well as on Pepco's web site. These materials and information provided in Pepco's monthly newsletter that is mailed to customers with their bill provide information that help families and individuals prepare in advance for any emergency situation and are a significant component of Pepco's advance planning efforts. Additional preparedness information, as well as neighborhood outage maps, with information regarding each outage event, including the ETR, is also available on the Pepco web site.

Pre-storm preparation is the process of preparing for mobilization before a storm occurs. When a significant major storm threatens, Pepco begins preparations, when possible, by reviewing Pepco's inventory of storm repair materials and notifying vendors of the potential need for material procurement. To plan for sufficient staffing, Pepco informs employees of the pending storm and the potential for activation of their incident response second role assignments. The Company also alerts Pepco contractors and discuss plans for possible aid from the utilities within Pepco's participating mutual assistance groups. Both advance planning and pre-storm preparation activities enable a state of preparedness to transition smoothly to IMT operations and to minimize restoration time.

After a storm affects the electric system, assessment and restoration begins. Damage Assessment requires an on-going evaluation of the substations shut down, distribution feeders locked out, and feeders with damaged segments, as well as the areas and the number of customers affected. This continual process enables efficient and appropriate allocation of restoration resources. The IMT is activated to provide customer communications and to coordinate the mobilization of crews for system repairs. Since damage assessment is on-going and storm levels may change in intensity, the restoration strategy may be modified throughout the effort, and the level of mobilization may be adjusted to meet restoration requirements.

Adequate supplies of materials, tools, and equipment are necessary for restoration to proceed safely and efficiently. Logistics include procuring, maintaining, and transporting restoration resources, personnel and materials. Departments are responsible for determining logistics requirements on an on-going basis and maintaining procedures.

When major reconstruction work or significant outside resources are required for system restoration, a staging area may be established. Staging Areas are defined as sites where crews and materials are temporarily stationed in severely damaged areas of the service territory. Staging areas are set up to respond to specific restoration efforts with assigned crews and on-site materials. Sites are selected for their accessibility, parking, and space to store materials needed for reconstruction and restoration of customer service, and ability to house and feed crews.

During major outage events of extended duration Pepco can use resources from other PHI companies, if available, or request mutual assistance from one of several regional and national mutual assistance groups in which it participates. These groups meet periodically to review policies, procedures and work practices to ensure continued ability to provide mutual assistance between electric utility companies. Post-event evaluations following major service outages contribute to continuous improvements to the Pepco District of Columbia MSO Plan. Response activities are most likely to improve when recommendations are linked and incorporated into the plan and departmental support procedures. These links serve as the vehicle to enhance response plan capability. Trained personnel are essential for successful execution of storm response duties. Additional training requirements may be highlighted as a result of debriefings or drills.

Further, during major outage events, Pepco uses AMI to enhance storm restoration efforts. For example, during those major outage events, Pepco's AMI capability to "ping" meters help to determine whether a customer has electric service. This application of Pepco's AMI network contributes to reducing restoration times, and avoiding costs, without necessitating phone calls to customers thus minimizing unnecessary costs. It also materially reduces the number of truck rolls needed to verify customer restoration, helping ensure that crews are dispatched efficiently.

Drills and Functional Exercises

In 2020, Pepco held Service Center Drills at the Forestville Service Center on September 18 and at Rockville Service Center on September 25. In addition, the Pepco IMT (Incident Management Team) held their annual Drill on May 28 which satisfied their regional exercise requirements.

In conjunction with the MSO Plan, Pepco may also activate PHI's Crisis Management Plan. PHI's Crisis Management Plan defines the management structure and outlines response activities for extensive emergencies, including unplanned events that can cause significant injuries to employees, customers or the public; cause physical, environmental or technological damage; or can shut down the business or disrupt operations. This plan also provides general guidelines allowing PHI and Pepco sufficient flexibility to respond to any emergency condition promptly and effectively.

PART 2: 2020 PIP

SECTION 2.1 – Requirements

On November 1, 1982, in Order No. 7668, the Commission adopted final rules regarding the submission of an annual PIP in Formal Case No. 766. These rules are codified in Title 15 of the District of Columbia Municipal Regulations, Chapter 5, Rules 502.1 and 502.2. In 1982, the Commission also directed the Company to establish the PIWG, consisting of representatives from the Commission Staff, the Office of the People's Counsel (OPC), and Pepco to provide a setting for communication among all parties and Commission Staff during the developmental stage of the first annual PIP. With the divestiture or transfer to an affiliate of all of Pepco's generating stations, the primary focus of the PIP and PIWG has shifted instead to transmission and distribution operations, performance, and reliability.[37] Later, Order No. 16623 emphasized a focus on reliability for the ACR.

SECTION 2.2 – PIWG

As discussed above, the PIWG has evolved over the years since its establishment but continues to serve as a standing committee for collaboration among the Commission Staff, the OPC, and Pepco. The PIWG meetings address issues of interest to the Commission or PIWG members. Agendas and meeting frequency are determined according to issues of immediate concern to PIWG members and according to directives of the Commission. The PIWG generally meets no more frequently than monthly, but at least once per quarter. A discussion of the items on the next meeting's agenda usually occurs at the end of each PIWG

[37] In Order No. 15152 on the 2008 Consolidated Report paragraphs 68 the Commission stated the following:
68. The Productivity Improvement Working Group, which includes OPC, provided a reasonable definition of a productivity improvement project in 2006. Specifically, the PIWG states:
T&D productivity improvement projects were considered those projects that will increase T&D system efficiency by reducing losses and improve[ing] system reliability, and which may defer more costly additions to the electric system. (Footnote: F.C. No. 766, Decision on Consideration of OPC's T&D Productivity Improvement Working Group in Response to Commission Order No. 13754, filed July 6, 2006 ("2006 PIWG Report"), at 2.)
The power serving the District's Standard Offer Service customers is now procured through a wholesale procurement process by PEPCO and, as such, productivity improvement is applicable only to transmission and distribution issues. We find the PIWG's definition of a productivity improvement project workable and adopt it here.

2020 PIWG Activities

The PIWG met five times in 2020. The 2020 PIWG meeting dates and meeting minutes filing dates are as follows:

Table 2.1-A

2020 PIWG Meeting Dates and Meeting Minutes Filing Dates

Meeting Date	Filing Date of the Meeting Minutes (See Formal Case No. 766 and PEPPIWG)
Feb. 28	Mar. 13
May 8	May 21
Aug. 25	Sep. 3
Nov. 13	Nov. 20
Dec. 18	Dec. 31

SECTION 2.1 – PIP

In Order No. 16623 on the 2011 Consolidated Report, the Commission stated the following in paragraph 8: "As a preliminary matter, we note our continuing concern with the reliability of the Pepco electrical distribution system… It is through the prism of these [reliability] efforts that we consider the Pepco Consolidated Report." In accordance with the Commission's focus in Order No. 16623 and the guidance of the PIWG, the Company presented its 2020 PIP projects, with a strong emphasis on reliability.

The 2020 PIP projects were as follows:

- 4 kV Distribution Substation Automation Projects

- 4 kV to 13 kV Conversion Projects
- DA Projects
- Priority Feeder Projects

2.1.1 PIP Project Status

The year-end 2020 status of the 2020 PIP Projects is included in Table 2.1-A.

Table 2.1-A: 2020 PIP Projects

Item	Description	PIP Project Year	2020 Project Amounts[1] (x1000)		Cost Variance Actual from Budget
			Budget	Actual	
1	4 kV Distribution Substation Automation Projects[38]	2020	$574,193	$645,405	($71,212)
2	4 kV to 13 kV Conversion Projects	2020	$12,111	$4,738	($5,531)
3	Distribution Automation Projects	2020	$9,200	$3,400	($5,800)
4	Priority Feeder Projects	2020	$3,685	$1,352	($2,332)

2.1.2 PIP Project Detail

Detail addressing each of the 2020 PIP projects – including work completed in 2020, work forthcoming in 2021, and longer-term plans – is provided below.

[38] The 4 kV Distribution Substation Automation Projects in this table only includes ITN # 70187.

4 kV Distribution Substation Automation Projects

The substation automation work continues at Macarthur Boulevard Sub 152 and is expected to be completed in the spring of 2021. The construction at Texas Avenue Sub. 1 1 1 is expected to be completed in the summer of 2022.

4 kV to 13 kV Conversion Projects[39][40]

These projects are included in the Load Growth program.

Background: The 4 kV distribution system supplies load throughout various neighborhoods in the District of Columbia. The 4 kV system has provided an effective and reliable supply to Pepco customers for many years. However, the 13 kV system is capable of supplying a greater density of load and generally produces less electrical losses. Therefore, as load density increases locally, or the system requires more maintenance and replacement becomes the best economic alternative, the 4 kV system is gradually being replaced with a 13 kV distribution system.

Magnitude of the Conversion: There are presently 110.9 megawatts of 4 kV load on the Pepco system, mostly in the District of Columbia. Over the next ten years, approximately 22 megawatts (including growth) will be converted to 13 kV service. Allowing for load growth, approximately 100 megawatts

[39] In Order No. 16091 at paragraphs 50, 53, and 64, the Commission stated the following:
50. Decision. We agree with the Staff recommendation and require Pepco to provide justification for any deviations from the plan schedules and annual budgets for 4 kV to 13 kV conversion projects in its Consolidated Reports, excluding minor deviations of less than 5%. This information may be provided in the discussion of "Reliability Projects."
53. Decision. …we have not adopted the Staff's "replace or rebuild" recommendation. However, we agree that future Consolidated Reports should contain detailed schedules and budgets for Reliability Projects, as well as justification for deviations from those schedules and budgets. We shall require Pepco to submit such schedules in future Consolidated Reports.
64. Pepco IS DIRECTED to provide detailed schedules and budgets for conversion projects, as well as justification for any non-minor deviations from these , consistent with Paragraphs 50 and 53 of this Order;
[40] Commission Order No. 16623 states the following:
32. Staff Recommendation: Require Pepco to provide and submit a report as to whether the budgets and schedules for each of the four 4 kV to 13 kV conversion projects have undergone non-minor deviations from previous plans. Include the justification for such deviations.
33. We accept the Staff's recommendation and direct Pepco to include a complete update in the 2012 Consolidated Report, including changes in budgets and schedules and justification for each non-minor deviation.
54. Pepco is DIRECTED to provide a report of conversion projects consistent with paragraph 33;

are projected to remain on the 4 kV distribution system by 2029. This 4 kV load will be located primarily in Wards 3, 7 and 8 where the load is served by substations that have either multiple transformers or are networked together through the feeder primaries. These remaining 4 kV areas are considered reliable due to the shortness of the feeders and the availability of ready backup. Areas that are going to be maintained and not converted will involve upgrading of substantial transformer equipment and other supporting equipment.

Areas Scheduled for Conversion: Areas supplied by the following substations are scheduled to have conversion work performed in the next ten years:

- Georgetown Sub. 12 NW Underground conversion.
- Harvard Sub. 13 NW Underground conversion.
- North Capitol Sub. 40 NE Overhead conversion
- Twelfth Street Sub. 126 SW Underground conversion
- Anacostia Sub. 8 SE Overhead conversion
- G Street Sub. 28 NE Underground conversion

All of the projects described below are multi-year projects with multiple phases. Five of the six projects were initiated prior to 2015. G Street was accelerated to begin work in 2016 to build infrastructure to extend new 13 kV feeders. This was done because significant new loads are expected to materialize in the G Street area and the existing 4 kV infrastructure is inadequate to meet this expected new load. Dollars spent on these projects may fluctuate over the years to account for project phasing. The Anacostia, Harvard and North Capitol conversion work is scheduled to be completed during 2021. The overall budget for the 4 kV conversion projects is still in line with the Company's long-term conversion plan.

Status: In 2020 Pepco spent $4,737,629 on its 4 to 13 kV conversion projects, $7,374,277 less than the budget of $12,111,906. The deviation between the 2020 budget and actual expenditures is due to a combination of work being delayed by re-design, permitting and work time.

Convert a part of the load at Georgetown Sub. 12 from 4 kV to 13 kV and retire 4 kV Substation

A modernization of this area infrastructure started in 2001. It includes the 4 kV to 13 kV conversions that will ultimately retire the 4 kV radial distribution system supplied from Georgetown Sub. 12. The 4 kV to 13 kV conversion has been completed for the area between M Street to the south, P Street to the north, Wisconsin Avenue to the west and 27th Street, NW to the east, by extending two 13 kV distribution feeders from Georgetown Sub.

In addition, conversions along M Street, Prospect Street, and N Street west of Wisconsin Avenue were completed in 2010 and 2011. Conversions along O and P Streets west of Wisconsin Avenue concluded in 2012.

Existing Configuration: The 4 kV underground radial distribution system serves mostly residential and some small commercial loads. Moderate load growth is anticipated for this isolated area but there are basically no external ties to deliver this power. The existing underground infrastructure, conduit and cable are in need of remediation with a history of extended outages due to limited transfer capability and circuit configuration and conduit construction that limits the size of cable that can be installed and provides limited physical protection to the cables.

The Georgetown 4 kV substation was rebuilt in the 1980s however the 4 kV underground infrastructure is the original construction and is nearing its full capacity.

Proposed Enhancement: Convert all 4 kV load to 13 kV with the exception of Francis Scott Key Bridge which feeds Roosevelt Island where step-down transformers are being considered due to access limitations and the retirement of all 4 kV substation equipment.

Status: With the exception of a few remaining transformers, conversions of the area north of M Street were completed in 2016. Due to the unanticipated non-constructability of the previous plans, all construction was placed on hold and Pepco revised the conversion work and released a new Construction Recommendation Plan in 2020.

The revised plan is a combination of traditional 4kV conversion work, load transfers to neighboring LVAC networks and possible consideration of other solutions. The new designs plan around the

"K" Street bridge crossing and the re-supply of load from Feeders 29 and 91 to other substations. Under the current schedule, work to retire the remaining five feeders should be completed by 2023. However, Pepco continues to encounter delays due to the network conversion portion which requires checking customer premises. The 2020 budget was $154,598 and approximate spend for 2020 was $118,802.

Georgetown Sub. Conversion Budget:

2021 – 2025 Budget (Figures in Thousands of Dollars)

2021	2022	2023	2024	2025	Total
$2,335	$3,668	$3,769	$0	$0	$9,772

Convert load at Harvard Sub. 13 from 4 kV to 13 kV and retire 4 kV Substation

This project will initiate infrastructure upgrades to the existing 4 kV system in the Upper Shaw and Harvard/Columbia Heights areas. Two 13 kV Feeders were extended from Florida Avenue Sub. 10 in 2011 to provide capacity for the conversion and to allow load to be transferred to Sub. 10 from Sub. 13. Existing 13 kV Feeders from Sub. 13 and new 13 kV Feeders from Sub. 25 were used to convert the final portion of 4 kV load starting in 2015.

Existing Configuration: The existing 4 kV underground distribution system serves residential and small commercial loads. Modest load growth is anticipated for this area which is isolated from the rest of the system and has no external ties. The existing underground system experiences feeder overloads, voltage deficiencies and a greater than average number of underground cable outages due to the age and condition of the cable and limited transfer and switching capabilities.

Proposed Configuration: Convert 4 kV load to 13 kV distribution feeders and retire Harvard Sub. 13 which currently operates at 4 kV.

Status:

100% of the Harvard 4 kV load has been converted to 13kV by the summer of 2020. Recently completed phases of the project utilized existing 13kV feeders from Harvard Sub. 13 and Florida

Avenue Sub. 10 to complete the conversion of load along Irving Street, Warder Street, Quebec Place, and Florida Avenue. The 2020 budget was $1,446,574 and approximately $1,760,387 was spent in 2020.

Harvard Sub. Conversion Budget:

2021 – 2025 Budget (Figures in Thousands of Dollars)

2021	2022	2023	2024	2025	Total
$0	$0	0	$0	$0	$0

Convert load at North Capitol Sub. 40 from 4 kV to 13 kV and retire 4 kV Substation

This project relates to an extension of existing and new 13 kV feeders to convert all 4 kV load served by North Capitol Street Sub. 40 to 13 kV. The North Capitol Street 4kV system serves mostly residential and small commercial customers in the Manor Park, Fort Totten, and Petworth neighborhoods. The first phase of this project to convert load from portions of North Capitol Sub. 40 Feeders 482 and 485 along 4th Street, NW between Buchanan and Hamilton Streets, NW to Fort Slocum Sub. 190 - 13kV Feeders 15006, 15012 and 15015 was completed in 2013. 2014 saw the completion of conversions along Hamilton Street, NW, Hawaii Avenue, NE and Fort Totten Drive, NE. In 2015, conversions were completed along North Capitol Street and Rock Creek Church Road.

Existing Configuration: The North Capitol Sub. 40 4 kV system is an isolated area on the Pepco distribution system that is not connected to any other 4kV substations or systems. Recent substation inspections have revealed deteriorating circuit breakers. The Allis Chalmers switchgear necessitates the salvage of spare parts from like equipment because the original equipment manufacturer is no longer in business and other manufacturers no longer supply parts for this equipment.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire North Capitol Sub. 40 - 4 kV.

Status: The project is underway. As of the end of 2020, several 13 kV trunk extensions have been completed and approximately 7 MVA of the 4 kV load has been converted to 13 kV. In 2017, two new 13 kV feeders were extended from Fort Slocum Sub. 190 to facilitate conversions in the area bounded by Kansas Avenue, NW, New Hampshire Avenue, NW, 4th Street, NW, and Missouri Avenue, NW. The budget for 2020 was 2,057,735 Approximately $647,550 was spent in 2020. Currently, nearly 65% of the load has been converted to 13kV with approximately 4.0 MVA remaining. This remaining load is in the vicinity of North Capitol Street and 3rd Street, NW between Kennedy Street and Buchanan Street, NW and will be converted to existing 13kV feeders from Fort Slocum Sub. 190. The 4 to 13 kV conversions in this area are scheduled to be completed by the summer of 2021.

North Capitol Sub. Conversion Budget:

2021 – 2025 Budget (Figures in Thousands of Dollars)

2021	2022	2023	2024	2025	Total
$2,452	$0	$0	$0	$0	$2,452

Convert load at 12th Street Sub. 126 from 4 kV to 13 kV and retire 4 kV Substation

This project will extend two 13 kV feeders in order to convert and/or transfer all 4 kV load supplied by 12th Street Sub. 126.

The 12th Street 4 kV system serves residential and small commercial customers in Southwest area and National Park Service buildings, street lights and traffic signals in the National Mall area. The conversion and retirement of the 12th Street Sub. 126 will be done in two phases. Phase 1 will construct an 8-way conduit bank from 2nd and C street SW to the vicinity of 7th and Maryland Avenue SW. It will involve the construction of approximately 1 mile of 8-way conduit bank. Phase 2 will involve extending Feeders 15294 and 15295 to two new three-way switches. Loops will then be extended from the switches to supply load around the National Mall and Southwest Waterfront. The last phase will require extending Feeders 15294 and 15295 to two new 3-way switches and extending laterals to the area of Hains Point, the Tidal Basin and the 14th Street Bridge.

Existing Configuration: The 12th Street Sub. 126 contains oil circuit breakers that will be removed based on the review of condition and reliability. Both the 13 kV/4 kV transformers are identified as in need of eventual replacement. These oil circuit breakers are no longer manufactured, and the manufacturer no longer provides spare parts. As part of the conversion process, this substation will be retired.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire Twelfth Street Sub. 126 – 4 kV including the transformers and oil circuit breakers.

These projects are included in the Load Growth program.

Status: The remaining major scope of work includes installing approximately 20,000 feet of #2 EPJ cable, ten (10) tap holes, 4 stepdown transformers and two (2) – 50kVA B phase transformers to complete the conversion for feeders 232 and 233. The completion of this work is contingent upon the approval of the National Park permit to complete the conduit work at locations along East Basin Dr. SW adjacent to the George Mason Memorial and portions of Ohio Drive on the east side of East Potomac Park. All conduit designs have been prepared and are in the process of coordinating with NPS and DDOT (extra coordination needed due to construction being necessary into the 395 abutments on Arland Williams Bridge). Field work has also been difficult to obtain due to road grade being close to the water table and NPS coordination needed for occupancy. The project is nearly ready to move forward with conduit construction. Based on designs being mostly complete, project on track to complete the conversion by end of year 2021. The budget for 2020 was $6,864,818 Approximately $639,254 was spent in 2020.

12th Street Sub. Conversion Budget:

2021 – 2025 Budget (Figures in Thousands of Dollars)

2021	2022	2023	2024	2025	Total
$3,092	$0	$0	$0	$0	$3,092

Convert Load at Anacostia Sub. 8 from 4 kV to 13 kV and Retire 4 kV Substation

The project relates to the extension of 13 kV feeders from Alabama Avenue Sub. 136 in order to convert all 4 kV load from Anacostia Sub. 8 4 kV and retire the Anacostia Sub. 8 – 4 kV substation.

The Anacostia Sub. 8 4 kV system supplies residential and small commercial load in the Anacostia area of Southeast Washington, D.C. New and existing 13 kV overhead feeders from Alabama Avenue Sub. 136 will be extended in order to convert all 4 kV load.

Existing Configuration: Anacostia Sub. 8 is supplied by two 34 kV feeders from Buzzard Point Station B. Converting 4 kV load from Anacostia Sub. 8 will also relieve load from Buzzard Point Station B 13 kV substation, which is approaching its firm capacity. Review of the equipment at Anacostia Substation and the 34 kV supplies indicated the need to replace all this equipment for long term reliability. Instead of rebuilding this station, conversion of the 4 kV load and transfer of the 13 kV load to Alabama Avenue Substation will allow the retirement of both the substation and supplies and improve the overall reliability of the distribution system in this area.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire Anacostia Sub. 8 – 4 kV.

Status: Much of the Anacostia Sub. 8 4 kV load has been converted over the past several years as part of the 23rd Street and Anacostia 4 kV conversion projects. Construction for the Anacostia 4 kV conversion project began in 2012 and about 2.4 MVA load has been converted to 13 kV. The 2020 budget for this project was $241,631 and $19,833 was spent in 2020. The work to convert the remaining 0.9 MVA to Feeders 15173 and 15178 is scheduled to be completed in 2021. Anacostia substation will be retired after all Alabama Avenue substation and distribution work has been completed. New feeders were recommended to transfer/covert all load currently supplied from the Anacostia substation to Alabama Avenue Sub. 136. All work is scheduled to be completed by the end of 2021.

Anacostia Sub. Conversion Budget:

2021 – 2025 Budget (Figures in Thousands of Dollars)

2021	2022	2023	2024	2025	Total
$700	$0	$0	$0	$0	$700

Convert load at "G" Street Sub. 28 from 4 kV to 13 kV and retire 4 kV Substation

This project relates to an extension of existing and new 13 kV feeders to convert all 4 kV load served by "G" Street Sub. 28 to 13 kV.

The "G" Street 4kV system serves mostly residential and small commercial customers in the Capitol Hill, Barney's Circle and Navy Yard neighborhoods. The first phase of this project to convert load from portions of "G" Street Sub. 26 feeders 212, 223, 227 & 228 Street, supplying load east of 11th Street SE and south of Pennsylvania Avenue SE to new Southwest Sub. 18 – 13kV Feeders 15876 and 15877, which has been designed and released to construction and will be extended to make the first phase conversions. The next phases will consist of extending a third 13 kV feeder from Southwest Sub. 18 along with the initial two feeders to convert portion of "G" Street 4kV load north of Pennsylvania Avenue SE and South of Massachusetts Avenue SE. The remaining 4 kV load north of Massachusetts Avenue SE will be converted to Benning Sub. 7 feeders 14708 and 14152.

Existing Configuration: G Street Sub. 28, was built in 1965 and is an isolated 4kV system not connected to any other 4kV substation. The area is experiencing moderate load growth and the existing 4kV system cannot accommodate any large new business load. Furthermore, some of the 4kV Feeders have had voltage problems, and the existing conduit and cables are very old. Therefore, an upgrade of this system is underway to eliminate potential reliability concerns proactively.

Status: Project scope and estimate was reassessed in early 2019. The project was handed over to Project Management for execution. It is currently in design. Construction anticipated to begin in late

2021. The 2020 budget for this project was $1,346,550 and approximately $1,551,803 was spent in 2020.

G" Street Sub. Conversion Budget:

2021– 2025 Budget (Figures in Thousands of Dollars)

2021	2022	2023	2024	2025	Total
$7,341	$13,649	$13,549	$13,277	$14,834	$62,649

2.2 DA PROJECTS

Distribution Automation is the conversion of a manually operated distribution system with limited available status information and limited control to a system that not only is fully automated but also performs operations totally independent of any human intervention. Advancements in technologies have made these automation activities practical for the lower voltage systems and will significantly change the way the Company responds to outages and operates and restores the electric system.

Status: Refer to section 1.3.1 (Technology: Monitoring, Automation, and Information System) above for the status of the completed DA Projects. There are 28 more feeders identified for ASR activation in 2021. To identify candidate feeders, Pepco evaluated the performance history of individual substation main and feeder breakers, and automatic reclosers downstream on circuits. Specifically, Pepco targets feeders with some of the highest SPC values which consider the customer interruptions and duration of these interruptions over the last three years. The table below lists the candidate feeders for ASR feeder scheme deployment in 2021 timeframe. This set of feeders will primarily benefit customers in Ward 8.

ASR Feeders Planned for 2021 with their Historical Lockout Statistics

PRIORITY FEEDER PROJECTS

These projects are included in the Feeder Improvement program.

Status: In response to the Commission's focus on preventing repeat Priority Feeders, Pepco has adjusted its feeder remediation strategy to a more comprehensive approach. Instead of focusing on locations where previous failures have occurred, the entire feeder is reviewed to address potential locations for future failures. The actual expenditure of the 2020 Priority Feeder Projects was approximately $1,500,000.

SECTION 2.3 – PERFORMANCE[41]

Priority Feeders & Aggressive Initiatives

Feeder Performance and Aggressive Initiatives

[41] Order No. 16975 states the following at paragraphs 58 and 59, 60, and 105:
58. Decision: …We therefore require Pepco to provide in the 2013 Consolidated Report, the information recommended by the Staff including an explanation of any discrepancies between work planned and work completed…. In Order No. 15941, the Commission required Pepco to provide specific information regarding any 4 kV feeder that has appeared on the Priority Feeder List three times or any 13 kV feeder that has appeared on the Priority Feeder List four times. On June 13, 2012, Pepco filed a report pursuant to that Order, providing information on two 13 kV feeders, 14717 and 14768. The Commission believes it is necessary to expand the scope of Pepco's reporting on feeder improvement to include any feeder that has appeared on the priority feeder list more than twice. Therefore, we require Pepco to provide the information required in paragraph 13 of Order No. 15941 in the future Consolidated Reports for any feeder appearing more than twice on the Priority Feeder List….
59. In future Consolidated Reports, Pepco shall include the following information about each feeder on the Priority Feeder List:
(1) a detailed description of outages, including causes and corrective actions taken;
(2) the SAIDI, SAIFI, number of interruptions, and number of hours of customer interruptions for that feeder for each year beginning with the year the feeder first appeared on the Priority Feeder list;
(3) a map showing the feeder service area, including affected neighborhoods;
(4) an analysis of why past corrective actions failed;
(5) Pepco's proposed solution to the feeder's reliability problem, including an explanation of options considered with the cost/benefit analysis of each and justification for the option recommended;
(6) a cost/benefit analysis of the solution, including budget and cash flows by year, as well as any impact on the revenue requirement; and
(7) a detailed justification for its aggressive feeder remediation measure of replacing open wire secondary with triplex secondary conductor.
60. The Commission notes that in recent PIWG meetings, Pepco has indicated its intention to change the methodology which it uses to determine Priority Feeders. A change in methodology would diminish the value of the Priority Feeder List in determining historically poorly performing feeders and would lessen our ability to track and compare the historical data. Therefore, we require Pepco to provide two Priority Feeder Lists, using both the historical (CPI) and any new methodologies in the 2013, 2014 and 2015 Consolidated Reports. In addition, the Commission requires Pepco to provide the information required by paragraph 13 of Order No. 15941 for any feeder appearing more than twice on the Priority Feeder List using either the historical or any new method.
105.Pepco is DIRECTED to provide information on Priority Feeders consistent with paragraphs 58-60 herein;

Feeder Performance

Each year Pepco analyzes the performance of its feeders to determine the relative ranking of each feeder from the best to the least reliable. From this ranking, Pepco selects the least reliable two percent (2%) of its feeders (excluding the selected feeders from the prior year study) to analyze and identify actions which likely will improve the reliability of the feeders, and therefore the system.

Beginning in 2013, the Company began using the SPC (System Performance Contribution), a method that provides greater system performance improvement potential. The SPC value for each feeder is calculated using the following equation:

SPC = 75% x (Feeder CI / System CI) + 25% x (Feeder CMI / System CMI),
Where

Feeder CI = Customer Interruptions of the feeder System CI = Customer Interruptions of the total system
Feeder CMI = Customer Minutes of Interruption of the feeder System CMI = Customer Minutes of Interruption of the total system.

In addition, when selecting the annual priority feeders, the selections are made based on the combination of the following criteria:

1) Feeders blended performance ranking by SPC values (i.e., individual feeder contribution to system SAIFI and SAIDI);
2) Feeders that are not repeated from the year prior;
3) Feeders with a minimum SAIFI value of 2.00; and
4) Feeders experienced at least 10 outage occurrences in the evaluation period.

Additional analysis at the feeder level is conducted to ensure the proper feeders are selected and corrective actions are reasonable (e.g., excluding feeders with abnormal configuration at the time of the outage occurrence, when outage causes were remediated during initial outage restoration work, etc.).

Excluded from this annual study are the Priority Feeders from the prior year, which typically would not show the full results of corrective actions until a full year following the completion of the corrective actions.

As of December 2020, there are 773 feeders (4 kV and 13 kV) in the District of Columbia. Sixteen feeders represent 2% of the 773-feeder total. The sixteen 2021 Priority Feeders, along with customers served, are provided in Section 2.4.1.2., and each includes a narrative outlining the initial measures necessary to improve performance. Additional corrective actions may result from continuing analysis of the outage data and detailed engineering. These feeders originate from seven different substations.

Attachment C contains maps of the 2021 Priority Feeders. The priority feeder program will be an enhanced initiative including both reliability work routinely performed on the selection of priority feeders supplemented with more aggressive initiatives.

Cost/Benefit Discussion

Order No. 16975 requires that Pepco provide the following in this and future Consolidated Reports (paragraph 59, item 6):

(6) a cost/benefit analysis of the solution, including budget and cash flows by year[44]*, as well as any impact on the revenue requirement;*

As described in previous ACRs, the measurement of benefits associated with feeder reliability projects generally depends on the outage history of the feeder and the likelihood that a portfolio of remediation activities will reduce or totally eliminate similar outages for the same or similar cause. Simply allocating a portion of the previous customer interruptions or customer minutes of interruption prior to the remediation activity is a way of qualifying the relative cost / benefit of individual remedial efforts. This is, however, not a dependable method of forecasting future feeder or aggregate system reliability because no remediation tactic is all inclusive of every possible outage cause. Likewise, this approach assumes all other inputs to system reliability are held constant (same weather, same animal events, same tree faults, etc.), which is unlikely.

Similarly, the measure and inclusion of cost/benefit per feeder or per individual initiative would potentially serve to reduce the field of options available to apply in feeder performance improvement. Some activities are not as efficient or economical as others based on a simple mathematical evaluation. However, the potential exclusion of these activities based on their relative inefficiency at the feeder or activity level would mean that the best overall portfolio of remedies could not be utilized in system level improvement. Further, with the advances in sectionalization technology, standard cost benefit analyses could drive a utility to employ only mitigation efforts rather than more appropriate but potentially more costly fault elimination tactics. Pepco evaluates each of these options and implements mitigation as well as elimination techniques when evaluating work to improve reliability of a feeder.

Aggressive Initiatives[42]

The Priority Feeder program is an enhanced initiative including both reliability work routinely performed on the selection of priority feeders supplemented with more aggressive initiatives.

Aggressive initiatives may include the following:

- Installation of tree wire in close configuration construction to replace bare wire through heavily treed areas where aggressive tree trim and standard cross-arm construction would have limited success or is restricted by ordinance or property owners.

[42] In Order No. 15152 paragraph 73, the Commission ordered the following:
73. Pepco is DIRECTED to investigate the viability of the "aggressive" initiatives for all least performing feeders, to file a progress report regarding the implementation of these initiatives where viable as part of the 2009 Consolidated Report, and to file quarterly progress reports thereafter, consistent with paragraph 62 of this Order;

In Order No. 15809 paragraph 11, the Commission ordered the following:
11. Pepco IS DIRECTED to include in its 2011 Consolidated Report a plan for development and application of "aggressive initiatives" to its underground distribution feeders;

- Installation of PAC for use as the main trunk of the feeder with the existing mainline reconfigured as fused laterals.
- Installation of automatic circuit reclosers (ACR) in loop scheme configuration to automatically sectionalize faulted sections of the feeder and provide automatic backup to unfaulted sections.
- Installation of remote operated load break switches into the loop scheme configuration with the automatic circuit reclosers.

Pepco's proposed aggressive initiatives to its underground distribution feeders are:

4 kV System

In addition to performing Very Low Frequency (VLF) testing and manhole inspections, the process of correcting identified issues also includes the following:

- Installation of tap-holes (switch points) at key locations to improve the ability to isolate problems as well as improving the ability to restore customers following each event.

- Perform a review of the failure history of the area for each failure and comparison of failure locations to replacement history. Perform proactive cable replacement of stretches that were not previously replaced in the area.

Regarding Commission's recommendation (per Order No. 16975) to add switch points to 4kV feeders, over time these 4kV feeders will be converted to 13kV, in which the loop alternate feed design is inherent. In the interim, all of the 4kV systems have backup supply for trunk outages. And for lateral outages, Pepco is replacing cable, installing tap holes, and ultimately converting all current underground 4kV feeders to 13kV feeders.

13 kV System

In addition to performing VLF testing and manhole inspection, correcting identified issues include the following:

- Perform a review of the failure history of the area for each failure and compare failure locations to replacement history. Perform proactive cable replacement of stretches that were not previously replaced in the area.
- Replace all of the problem sections of cable.

For various reasons, not all of the "Aggressive Initiatives" are applied to each of the Priority Feeders. For example, if a particular feeder is completely underground, installing tree wire, PAC, ACR and remote operated load-break switches would not be applicable as these types of equipment are not used on underground feeders. Similarly, if a feeder is already equipped with remote switching capabilities and the switches are functioning properly, then simply increasing the number of remotely operated switches will generally not yield improvement. Further, if the predominant outage cause for a feeder is not tree-related, installing tree wire along the previous outage locations, will not yield performance improvement.

Order No. 16975 states the following at paragraph 58:

58. …In addition to the information required by paragraph 13 of Order No. 15941, the Commission also requires that Pepco provide detailed justification for its aggressive feeder remediation measure of replacing open wire secondary with triplex secondary conductor, as recommended by the OPC response.

The following is Pepco's explanation for replacing open wire secondary conductors with triplex conductors:

Triplex conductors are less susceptible to mechanical damage such as trees, winds, etc. They increase the distance between the primary and neutral conductors, which reduces the opportunity for primary related tree outages. Other miscellaneous upgrades will also be performed such as pole, hardwire, and equipment replacements due to deterioration. Upgrading will significantly reduce future equipment failures. Should damage occur, restoration is faster with the triplex conductors. Therefore, customers will experience lower number of outages as well as a shorter duration of outages. The cost to replace open wire secondary conductors with triplex conductors is approximately $40,000 per mile.

Section 2.3.1 2020 PRIORITY FEEDER PROGRAM

Order No. 16975 requires that Pepco provide the following in this and future Consolidated Reports (paragraph 59, item 1):

(1) a detailed description of outages, including causes and corrective actions taken;

Table 2.3A: Priority Feeder program - Completed Corrective Actions

2020 Priority Feeder Program - District of Columbia - Corrective Actions Proposed vs. Completed				
Rank	**Feeder**	**Proposed Corrective Actions, as filed in the 2020 Consolidated Report**	**Detailed Corrective Actions - Completed**	**Explanation of Variances/ Comments**
	14035	• Install/Replace 1050' of Primary Wire •Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	• Install/Replace 1050' of Primary Wire •Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	No variance
	00328	• Install/Replace 4 Poles •Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	• Install/Replace 4 Poles •Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	No variance
	15867	•Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	•Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	No variance
	14136	•Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	•Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	No variance
	00211	•Due to ongoing work taking place under the G Street Conversion Program, no work is planned on this feeder under the 2020 Priority Feeder Program.	•No Work	No variance
	14711	•Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	•Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	No variance
	15130	• Install/Replace 1700' of Primary Wire •Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	• Install/Replace 1700' of Primary Wire •Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated down guys, etc.	No variance

Proposed Corrective Actions for 2021 Priority Feeders[43]

The following information provides an overview of the outages and proposed corrective actions for the 2021 Priority Feeders and detailed information regarding the equipment related events and/or outages. Please see Attachment C for maps of the 2021 Priority Feeders reflecting overhead and underground portions, and the Priority Feeders by District of Columbia Ward.

Pepco's OMS assigns event numbers based on length of time between interruptions. Therefore, during the trouble locating and restoration process, more than one event number may be generated and counted. For the sections that explain equipment failures, for mainline feeders, line fuses and transformers, the events were grouped by incidents.

2021 Priority Feeders

The following 16 feeders have been identified as priority feeders. Please note that some feeders, as stated below, will not have work performed in 2021 under the Priority Feeder program; rather, as specified below, some feeders had corrective work performed coincident with the outage(s) that caused the feeder to be a priority feeder or whose work is subsumed in another reliability program.

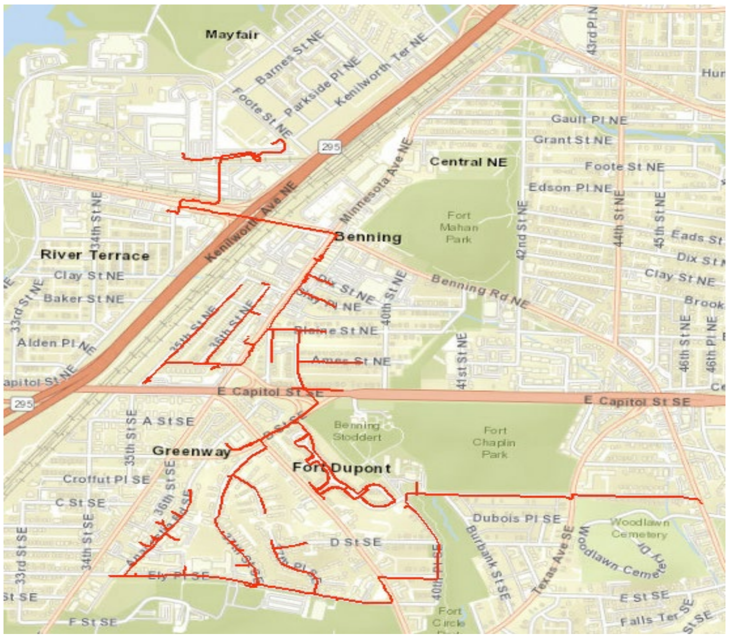
Please note that, in a change from previous years' reports, Pepco is now budgeting for the entire class of priority feeders rather than for each feeder. The 2021 budget for priority feeders is $1,832,735.[44]

Circuit: 15709

County	Substation	Customers Served	Number of Outages	Oct. 2019-Sept. 2020 Reliability Indices (In Hours)			Feeder Miles			Repeated Last 2 Years?
				SAIFI	SAIDI	CAIDI	OH	UG	Total	
DC	Benning (7)	2,768	23	1.994	65.2	32.7	62%	38%	9.39	N

[43] Actual equipment failures may be more or less than the number shown because a single event may give rise to more than one equipment failure and due to OMS limitations, that do not allow a single unique case to be identified in each line.
[44] The budget can be adjusted according to the needs of the program.

Feeder Map and Location:



Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) Thirty three percent (33%) of customer outages were due to three mainline events; one event was caused by weather/wind, another caused by vandalism, and the third event was caused by equipment failure. Sixty six percent (66%) of customer outages were due to six lateral events. Two events were caused by equipment failure, one event was caused by an animal, one event was caused by foreign contact, one event was caused by vandalism, and one event was caused by trees.

2019: (Oct 18-Sep 19) Thirty eight percent (38%) of customer outages were due to eight mainline events; four events were caused by equipment failure, two were caused by trees, one event was caused by an animal, and one outage event occurred with an unknown cause. Sixty two percent (62%) of customer outages were due to lateral events; eleven outages were due to equipment failure caused by underground cable and fuse events. One event was caused by vandalism, and one event was caused by trees.

2020: (Oct 19-Sep 20) Eighty seven percent (87%) of customer outages were due to twenty-five lateral events. Thirteen outage events were due to equipment failures resulting from issues with individual meters or transformers; three outages were caused by underground cable failure. Four lateral outage events were due to an unknown cause, and the remaining five lateral outages were due to foreign contact, animal, employee, load, and a cable cut. Thirteen percent (13%) of customer outages were caused by mainline events. Three events were caused by an equipment failure at a fuse location, and one event was caused by a breaker event during a scheduled outage.

Feeder Performance (Oct 19-Sep 20)

Unknown	0.012	<1%%
Other	0.013	<1%

* Other Category Includes: Foreign Contact, Employee, Cable Cut, Load

<u>Field Observations:</u>

Feeder 15709 serves approximately 2,768 customers in the Benning, Dupont Park, Fort Dupont, Greenway, and River Terrace areas of Washington D.C. The feeder primarily consists of residential customers, with a mix of some commercial customers along the early part of the feeder. The mainline portion of the feeder runs underground from the Benning Substation up to Minnesota Ave NE, where it transitions to overhead and proceeds to run Southwest on Minnesota Ave NE. After turning off of Minnesota Ave NE, the feeder proceeds to run South following a path along Blaine St NE, Burns St NE, B St SE, and 37th St SE. Once the feeder reaches Ely Pl SE, it splits and runs to both the East and to the West. The portion of the feeder to the East runs along Ely Pl SE, Burns St SE, and C St SE, with only a few load points. Headed to the West, the feeder has a much higher customer count, feeding multiple apartment buildings off of Ely Pl SE, Minnesota Ave SE and B St SE. The mainline portion of the feeder is a mix of 477 ACSR Treewire,477 ACSR Bare wire, and PAC cable, with a majority of this being newer construction. There are opportunities to improve animal protection at all large equipment poles.

Previous Actions Taken (Past 3 years):

2018 Area Plan

Feeders 15709 and 14812 reconductored with 477 ACSR Tree wire from the North side of East Capitol St NW, heading southwest along B St SE, and then to the intersection of Ridge Rd SE and 37th St SE.

Reconductor two spans of mainline with 477 ACSR Tre wire along 37th St SE

Reconductor 14 spans of mainline with 477 ACSR Tree wire along Ely Pl SE

Install fuses at three unfused laterals.

Benning Feeder Extension

Convert single phase primary conductor along B St SE between Minnesota Ave SE and Railroad Tracks to three phase primary to allow for all load on feeder from N.C. Recloser on Ely Pl SE, east of Anacostia Rd SE, heading north along Minnesota Ave SE, and West on B St SE to be transferred to feeder 14806.

Planned Remediation (Current Year):

Mainline work includes addressing animal and BIL concerns at large equipment locations, installing fused cutouts, and installing phase spacers along spans with excessive slack.

Milestones/Schedule:

	Design Complete	**Permitting Complete**	**Release to Construction**	**Construction Complete**
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work planned will improve animal protection on the feeder, as well as added protection when high wind events occur, thereby improving the feeder performance.

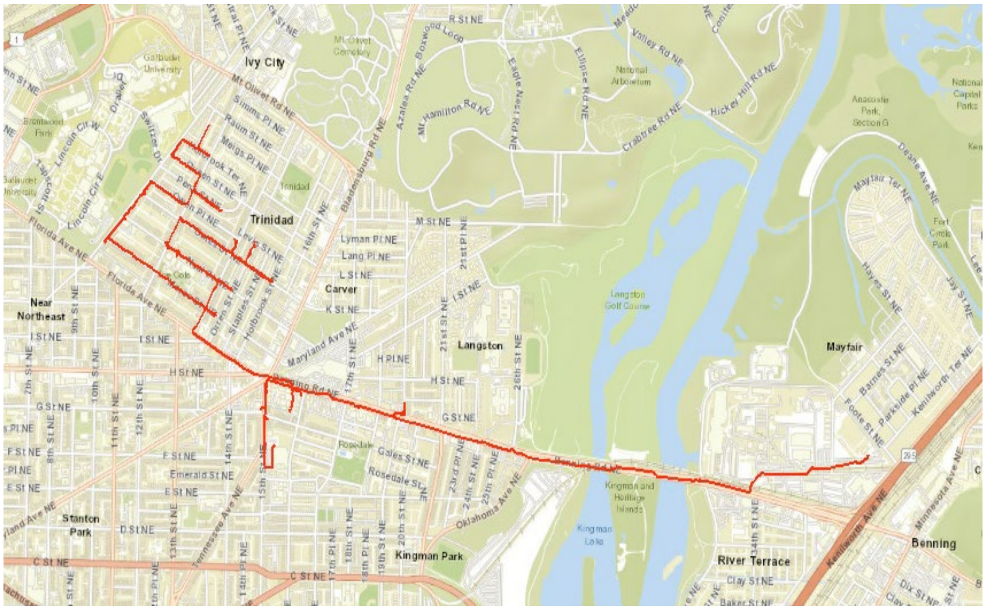
Feeder Map and Location:



Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) One hundred percent (100%) of customer outages were fused lateral events; eight outage events were caused by equipment failure; three outages had an unknown cause, and two outages were due to cable cuts.

2019: (Oct 18-Sep 19) Forty percent (40%) of customer outages were mainline events. The two mainline outage events were caused by equipment failure. Sixty percent (60%) of customer outages were lateral events; two events caused by underground cable failure and one event caused by a cable cut.

2020: (Oct 19-Sep 20) Thirty three percent (33%) of customer outages were mainline events; eight events caused outages all relating to underground cable and transformer failures. Sixty six percent (66%) of customer outages were fused lateral events; ten events were caused by equipment failure; and six events were due to an unknown cause.

Feeder Performance (Oct 19-Sep 20)

Outage Cause by SAIFI	SAIFI	% of Feeder SAIFI
Equipment Failure	2.188	75%
Unknown	0.723	25%

Field Observations:

Feeder 14712 serves approximately 1,359 customers in the Carver/Langston and Kingman Park neighborhoods in NE Washington, DC. This feeder is 100% underground construction and feeds residential customers.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Mainline work includes replacements and/or installation of crossarms, fused cut-outs, lightning arrestors, animal guards, down-guys, head-guys, anchors and fault indicators.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	3/15/2019	5/15/2019

Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies will help to improve the resiliency of the feeder, thereby supplying a more reliable service to customers served by this feeder.

Weather	0.027	1%
Animal	0.011	<1%
Other*	0.001	<1%

* Other Category Includes: Vandalism, Employee

Field Observations:

Feeder 14022 serves approximately 1,901 customers in the Brookland, Edgewood, and North Michigan Park neighborhoods in NE Washington, D.C. The overhead portion of the feeder that runs to the West, along 9th St NE, has been hardened in recent years and exclusively feeds industrial customers. The eastern portion of the feeder runs along Lawrence Ave NE and branches off in multiple directions to supply power to residential customers and create ties to other feeders in the surrounding area. These portions of the mainline branch off and run along 13th St NE, 16th Pl NE to the south, and 16th Pl NE to the north continuing along Otis St NE and 22nd St NE. A majority of the feeder has had work completed on it in recent years to reconductor the mainline with 477 ACSR Treewire. Areas of the mainline along 16th St NE, Otis St NE, and 22nd St NE contain older structures with copper wires, which leave the feeder vulnerable. There are also opportunities throughout the feeder to address animal and lightning concerns at large equipment poles.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Reconductor ~724’ of existing 4/0 ACSR Treewire along Kearny St NE with 477 ACSR Treewire

Reconductor ~3,818’ of existing copper primary along 16th St NE and Otis St NE with 477 ACSR Treewire

Reconductor ~569' of existing copper primary along 22nd St NE with 477 ACSR Treewire

Install fused cutouts on unfused laterals and relocate existing cutouts to the mainline pole at laterals that are exposed to outage potential.

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The reconductoring work will allow Feeder 14022 to reliably tie into and back feed from other feeders while also increasing resiliency against weather and any vegetation issues. The minor work being performed as part of the priority feeder program will further improve the feeder performance and animal/BIL deficiencies, thereby providing added resiliency and more reliable service to the customers served by this feeder.

Feeder Map and Location:

Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) Fifty percent (50%) of twenty customer outages were mainline events. There were four outages caused by equipment failures; three outage events were caused by vandalism; two outages were caused by animals; one outage was caused by weather. Ninety percent (90%) of the ten lateral outage evens on this feeder were due to equipment failures; the remaining outage event was caused by vandalism.

2019: (Oct 18-Sep 19) Fourteen percent (14%) of seventy-four outage events were mainline events. Seven outage events were caused by equipment failures; two events were caused by foreign contact; one event was caused by a motor vehicle; and one event was caused by trees. Eighty-six percent (86%) of outage events on the feeder were fused lateral events. Of the lateral events that occurred, ninety-six percent (96%) of the outages were due to one isolated equipment failure. The remaining two outage events were separate events that were also caused by equipment failure.

2020: (Oct 19-Sep 20) Thirty-six percent (36%) of twenty-two outage events on this feeder were mainline outages. Three outages were caused by foreign contact; two outages were caused by equipment failure; another two outages were caused by trees, and one mainline outage event occurred due to an unknown cause. There were fourteen lateral outages on this feeder, making up sixty four percent (64%) of outage events. Eleven lateral outage events due to equipment failure; ten of these eleven outages were in relation to one isolated downed wire issue. The remaining three lateral outage events on this feeder were caused by animals.

Feeder Performance (Oct 19-Sep 20)

Foreign Contact	0.062	<1%

<u>Field Observations:</u>

Feeder 14758 serves approximately 2,169 customers in the Anacostia Naval Station – Bolling Air Force Base, Bellevue, and Washington Highlands neighborhoods in SE Washington D.C. The mainline portion of this feeder originates on Chesapeake St SW, just east of Interstate-295 and proceeds to run east along Chesapeake St SW. The mainline also runs to the south along Martin Luther King Jr Ave SW and branches in multiple directions including southwest along Blue Plains Dr SW to feed the Metro station, south along Martin Luther King Jr Ave supplying power to apartment buildings and industrial customers, and heading east along Galveston St SW to tie into multiple feeders along South Capitol St SW. The mainline portion of the feeder is about an equal split of newer construction that utilizes PAC cable for longer stretches where there is not any load present and older construction with copper wire still in place.

Previous Actions Taken (Past 3 years):

As a result of multiple outage events, ~1,750' of mainline conductor was reconductored with PAC cable along Martin Luther King Jr Ave SE between Chesapeake St SW and Galveston St SW.

Planned Remediation (Current Year):

Mainline:

Reconductor ~1,617' of copper wire with 477 Treewire along Galveston St SW, from Martin Luther King Jr Ave SW to S Capitol St SW.

Reconductor ~500' of copper wire with 477 Treewire within the ROW off DC Village Ln SW.

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Ongoing work is taking place on this feeder to convert the older construction to underground cable along Martin Luther King Jr Ave SW, as well as feeds to/within The Vista and The Gardens Apartment buildings.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The reconductoring work will allow Feeder 14758 to reliably tie into and back feed from other feeders in the surrounding area, while also increasing resiliency against weather and any vegetation issues. The other minor work on this feeder to address animal/BIL deficiencies will also help to improve the resiliency of the feeder, thereby providing a more reliable service to customers served by this feeder.

Unknown	0.016	1%

Field Observations:

Feeder 15010 serves approximately 1,830 customers in the Brightwood neighborhood in NW Washington D.C. The mainline portion of the feeder originates out of the Ft Slocum Substation and runs to the north on North Dakota Ave NW before heading to the west along Quackenbos St NW feeding residential customers along Quackenbos St NW. As the feeder reaches 9th St NW, it splits and heads both north and south along 9th St NW providing service to both residential and commercial customers along 9th St NW and Georgia Ave NW. A majority of the mainline portion of this feeder consists of older construction with copper wire within the breaker zone and along the feeder heading to the north along 9th St NW, while the portion of the feeder heading to the south is newer construction with 4/0 ACSR Bare wire and newer construction.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) Eight percent (8%) of customer outages were due to three mainline events. Two mainline outages were caused by equipment failure, and one outage was caused by trees. Ninety-two percent (92%) of customer outages were caused by fused lateral events. Fourteen outages were caused by equipment failure; seven outages were caused by trees; four outages were caused by animals; four outages occurred due to an unknown cause; one outage occurred due to weather and one outage was caused by a cable cut.

2019: (Oct 18-Sep 19) Twenty two percent (22%) of customer outages were due to mainline outages. One hundred percent (100%) of mainline outages were caused by trees. Seventy-eight percent (78%) of customer outages were due to fused lateral events. Seven outage events were caused by equipment failure; seven events were caused by trees; four outages occurred due to an unknown cause; three outages were caused by animals; two outages were caused by foreign contact; one outage was caused by weather.

2020: (Oct 19-Sep 20) Thirteen percent (13%) of thirty customer outages were mainline events. Three outages were caused by equipment failure; one outage was caused by trees. Eighty seven percent (87%) of customer outages were due to fused lateral events. Eight outage events were caused by weather; six outages were caused by equipment failure; five outage events were caused by trees; three outages occurred due to an unknown cause; two outages occurred due to animals and two outages were caused by overload.

Feeder Performance (Oct 19-Sep 20)

Outage Cause by SAIFI	SAIFI	% of Feeder SAIFI
Equipment Failure	1.015	55%
Weather	0.477	26%
Tree	0.216	12%
Unknown	0.096	5%
Animal	0.030	1%
Load	0.020	1%

Field Observations:

Feeder 14900 serves approximately 1,348 customers in the Barnaby Woods and Hawthorne neighborhoods in NW Washington D.C., extending into the Chevy Chase neighborhood in Montgomery County, MD. A majority of the breaker zone for this feeder consists of newer construction, utilizing both PAC Cable and 4/0 ACSR Treewire, that has been implemented to address heavy vegetation concerns along the pole line. The lone area within the breaker zone that consists of older construction with copper wire is along Utah Ave NW, from Rittenhouse St NW to the tie switch just northwest of 31st Pl NW. The laterals on this feeder run to residential customers and have sufficient fused cutouts in place to attempt to minimize any interruptions that may be experienced along the many laterals.

Previous Actions Taken (Past 3 years):

DC Plug program has ongoing work to convert a portion of this feeder along Oregon Ave NW to underground, to remediate heavy tree canopy along this roadway.

Planned Remediation (Current Year):

Mainline:

Reconductor ~825' of copper wire with 477 ACSR Treewire along Utah Ave NW, from Rittenhouse St NW to tie switch.

Relocate cutouts to mainline poles where potential threats exist at current locations.

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The reconductoring work will allow Feeder 14900 to reliably tie into and back feed from other feeders in the surrounding area, while also increasing resiliency against weather and any vegetation issues.

Ongoing DC Plug work will provide a large benefit to the overall reliability of the feeder as well. The other minor work on this feeder to address animal/BIL deficiencies will also help to improve the resiliency of the feeder, thereby providing a more reliable service to customers served by this feeder.

Animal	0.035	2%
Weather	0.008	<1%
Other*	0.008	<1%

* Other Category Includes: Employee

Field Observations:

Feeder 15197 serves approximately 1,300 customers in the Crestwood, Petworth, and Sixteenth Street Heights neighborhoods in NW Washington D.C. The mainline portion of the feeder originates out of the

Ft Slocum Substation and runs a significant distance transitioning back and forth between underground cable and PAC cable, while the PAC cable opens up to create taps to tie switches and residential customers along the way. The western most portion of the feeder does open up to an open wire configuration, with tree wire in place to address vegetation concerns as it enters into and serves residential customers in the Crestwood neighborhood. The mainline is well protected from vegetation threats and existing fused cutouts provide sufficient protection to vulnerabilities along laterals.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies will help to improve the resiliency of the feeder and provide a more reliably option to tie into and back feed from other feeders in the surrounding area, thereby providing a more reliable service to customers served by this feeder.

Circuit: 15001

County	Substation	Customers Served	Number of Outages	Oct. 2019-Sept. 2020 Reliability Indices (In Hours)			Feeder Miles			Repeated Last 2 Years?

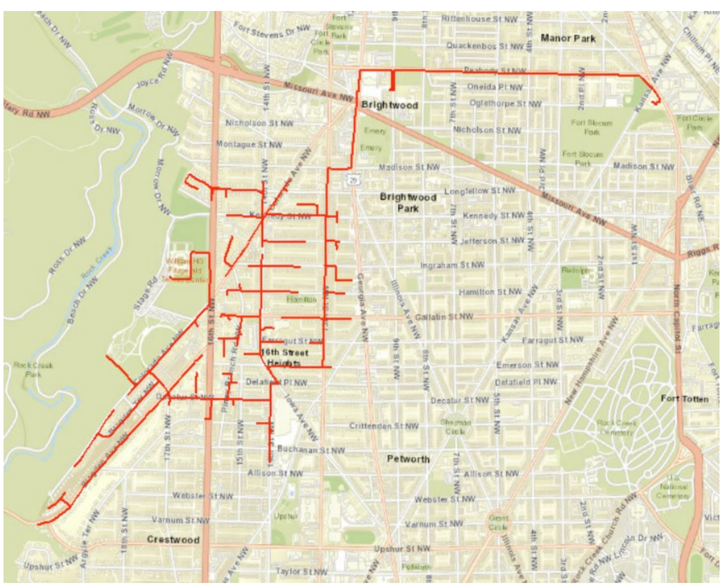
Feeder Map and Location:



Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) One hundred percent (100%) of customer outages were fused lateral events on this feeder. Six outage events were caused by equipment failure; six outages were caused by trees; two outages were caused by weather; two outages were caused by motor vehicles; one outage was caused by animals and one outage was caused by an overload.

2019: (Oct 18-Sep 19) Forty five percent (45%) of customer outages were due to mainline events. Eight outage events were due to an isolated incident caused by trees and one outage was caused by animals. Fifty five percent (55%) of customer outages were due to lateral events. Five events were caused by equipment failures; two events occurred due to unknown causes; two events were caused by trees; one event was caused by animals and one outage was caused by a motor vehicle.

2020: (Oct 19-Sep 20) Ninety percent (90%) of thirty-two customer outages were lateral events. Ten outages were caused by equipment failure; six outages were scheduled outages; five outages were caused by trees; two outages were caused by animals; two outages were caused by motor vehicles; two outages were caused by load issues and two outages occurred due to an unknown cause. Ten percent (10%) of customer outages on this feeder were mainline events. Two outages were caused by animals and one outage occurred due to an unknown cause.

Feeder Performance (Oct 19-Sep 20)

Outage Cause by SAIFI	**SAIFI**	**% of Feeder SAIFI**
Equipment Failure	0.498	31%
Tree	0.349	22%
Scheduled	0.299	18%
Other*	0.297	18%
Unknown	0.149	11%

Field Observations:

Feeder 15001 serves approximately 1,341 customers in the Brightwood Park, Petworth, Sixteenth Street Heights, and Crestwood neighborhoods in NW Washington D.C. The mainline portion of this feeder originates out of the Ft Slocum Substation and runs west underground up to 13th St NW. The feeder transitions to overhead wire and runs south along 13th St NW, Emerson St NW, 14th St NW, and Decatur St NW serving a mix of residential and commercial customers along the entirety of the feeder. The mainline along 13th St NW is a mix of newer construction with 477 ACSR Treewire and older construction with copper wire, while the remainder of the mainline has been hardened with 4/0 ACSR Treewire to help remediate vegetation threats along the pole line.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Reconductor ~2,300' of copper wire along 13th St NW from Kennedy St NW to Emerson St NW with 477 ACSR Treewire

Replace damaged or aged crossarms and poles throughout the mainline portion of the feeder.

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments				

Completed Remediation Work: N/A

Anticipated Benefits:

The reconductoring work on Feeder 15001 will address the remaining weak points along the mainline on this feeder, while also increasing resiliency against weather and any vegetation issues. The other minor work on this feeder to address animal/BIL deficiencies will also help to improve the resiliency of the feeder, thereby providing a more reliable service to customers served by this feeder.

<u>Field Observations:</u>

Feeder 14023 serves approximately 529 customers in the Brentwood, Brookland, and Eckington neighborhoods in NE Washington D.C. The mainline portion of the feeder originates out of the 12th & Irving Substation and runs along 10th St NE, Rhode Island Ave NE, 12th St NE and Brentwood Rd NE servicing mostly industrial and commercial customers, with some residential customers as well. The early portion of this feeder running along 10th St NE and Rhode Island Ave NE is a mix of old and new construction with existing copper wire still in place and has experienced a variety of issues that have led to outages. The remainder of the mainline is a mix of construction with 4/0 ACSR Bare wire in place along 12th St NE and Brentwood Rd NE.

<u>Previous Actions Taken (Past 3 years)</u>:

2019 – Reconductor six spans of mainline with Treewire along Brentwood Rd NE at 12th St NE

<u>Planned Remediation (Current Year):</u>

Mainline:

Reconductor 1,500' of 1/0 Copper Primary with 477 ACSR Tree Wire in Breaker Zone along 10th St NE and Rhode Island Ave NE.

Replace aged crossarms in Breaker Zone along Brentwood Rd NE.

Install Phase Spacers at midspan for spans that have excessive slack in the 2nd zone along Brentwood Rd NE.

Address any animal, lightning, phase-to-phase, and phase-to-ground issues at large equipment locations.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	TBD	TBD
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The reconductoring work on Feeder 14023 will address the area at the beginning of the feeder that has experienced frequent issues that have resulted in outages to the entire feeder. Reconductoring portions of this feeder will also allow to reliably tie into and back feed from other feeders in the surrounding area, while also increasing resiliency against weather and any vegetation issues. Phase spacers along Brentwood Rd NE will increase resiliency of the feeder during high wind weather events.

Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) Twenty one percent (21%) of nineteen customer outages on this feeder were mainline events. Three outages were caused by weather and one event was caused by trees. Seventy nine percent (79%) of nineteen customer outages were due to fused lateral events. Eight outage events were caused by equipment failure; three outages were caused by weather; one outage was caused by vandalism; one outage was caused by an overload; one outage occurred due to an unknown cause and one outage was caused by trees.

2019: (Oct 18-Sep 19) Thirty five percent (35%) of fourteen customer outages were mainline events. Four outages were caused by one weather event, and one outage was caused by an equipment failure. Sixty five percent (65%) of fourteen customer outages on this feeder were lateral outages. Four lateral outages were caused by equipment failures; three outages were caused by animals; one outage was caused by a motor vehicle and one outage was caused by trees.

2020: (Oct 19-Sep 20) Six percent (6%) of forty-six customer outages on this feeder were mainline outage events. One outage was caused by an overload, one outage was caused by trees, and one outage was caused by animals. Ninety-four percent (94%) of the forty-six outages on this feeder were lateral events. Thirty-four outage events were caused by equipment failures, seventy six percent (76%) of which were due to a localized incident of a downed wire. Five outages were attributed to trees; two outages were caused by motor vehicles; one outage was caused by vandalism and one outage was caused by an overload.

Feeder Performance (Oct 19-Sep 20)

Outage Cause by SAIFI	SAIFI	% of Feeder SAIFI

Tree	0.077	6%
Animal	0.040	3%
Other*	0.020	2%

*Other Category Includes: Motor Vehicle, Vandalism

Field Observations:

Feeder 15013 originates from the Fort Slocum substation in northwest Washington, DC, and serves approximately 1,824 customers. The feeder is 75% overhead and 25% underground and provides power to both residential and commercial customers. The mainline emerges from the substation along Blair Rd NW where the feeder runs south, continuing to North Capitol St NW The mainline trunk continues to the south until Kennedy St NE where it runs east, then heads to the southeast along Blair Rd NE. The mainline trunk of the feeder continues in this manner along Rock Creek Church Rd NE until the mainline trunk branches off onto Farragut St NE where the feeder ends at a riser pole. In the other direction, the line continues to the south along Fort Totten Dr NE with several lateral branches off the main trunk around Bates Rd NE, Allison St NE, and Hawaii Ave NE. The feeder continues down Fort Totten Dr NE until Taylor St NE, where the feeder then turns to the west and runs along Fort Dr NE up to Rock Creed Church Rd NW. The feeder also branches off of Taylor St NE along Harewood Rd NE to the south until turning to the east along Michigan Ave NE and ending underground in the vicinity of Michigan Ave NE and Monroe St NE.

Previous Actions Taken (Past 3 years):

No work performed within last 3 years.

Planned Remediation (Current Year):

Mainline:

Reconductor ~2,900' of primary conductor in the breaker zone to address areas of undersized conductors as well as bare conductor.

Additional work includes crossarms, fused cut-outs, lightning arrestors, animal guards, down-guys, head-guys, anchors and fault indicators.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A

Actual	N/A	N/A	N/A	N/A
Variance Comments				

Completed Remediation Work: N/A

Anticipated Benefits:

Reconductoring in the breaker zone will help to harden areas that have shown vulnerability in the past and will help prevent as many future breaker events as possible. The minor work being performed as part of the priority feeder program will further improve the feeder performance and animal/BIL deficiencies, thereby providing added resiliency and more reliable service to the customers served by this feeder.

Employee	0.937	45%
Animal	0.924	45%
Equipment Failure	0.192	10%

Field Observations:

Feeder 14150 serves approximately 874 customers in Northwest Washington D.C. Originating from the Van Ness Substation; this circuit is 13% overhead and 87% underground. The mainline provides both residential and commercial service. In the small section with overhead there is insulated primary conductor with crossarm construction on poles in good condition.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Installing fuses at unfused laterals to provide mainline protection from faults downstream and further sectionalize the feeder. Additional work includes crossarms, fused cut-outs, lightning arrestors, animal guards, down-guys, head-guys, anchors and fault indicators.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

*Other Category Includes: Equipment Failure, Employee

Field Observations:

Feeder 00372 serves approximately 756 customers in Northeast Washington D.C. Originating from the Seat Pleasant Substation; most of this circuit consists of overhead construction (98% overhead and 2% underground). The mainline provides both residential and commercial service. The mainline emerges from the substation on 59th St SE and heads north. The feeder then continues on Blaine St NE to the east, following to the south on 58th St SE and ending along Southern Ave. To the north of Blaine St NE, the feeder runs along 57th St NE. The mainline of the feeder then heads to the east along Dix St NE, proceeding until 61st St NE, then runs north along 61st St NE. The end of the feeder extends into Prince George's County, Maryland where it branches off and ends on Foote St and 61st Ave. The devices, poles, and conductor on this feeder are generally in good condition, however there are a couple of areas that have older poles and conductors.

Previous Actions Taken (Past 3 years):

This feeder was upgraded under the 2020 Comprehensive Feeder Program where wires, poles and equipment were upgraded to improve performance.

Planned Remediation (Current Year):

Mainline:

No work is being performed on this feeder.

Milestones/Schedule:

Five outage events were caused by equipment failure; four outages were caused by animals; two outages were caused by trees; one outage was caused by an employee and one outage occurred due to an unknown cause.

2019: (Oct 18-Sep 19) One hundred percent (100%) of five customer outages were fused lateral events. Three events were caused by equipment failure; one event was caused by a load issue and one outage event occurred due to an unknown cause.

2020: (Oct 19-Sep 20) Seventy four percent (74%) of eleven customer outages on this feeder were mainline events. Six outage events were caused by equipment failure and one outage on the mainline occurred due to vandalism. Thirty six percent (36%) of customer outages were fused lateral events. Three outages were caused by foreign contact and one outage was caused by equipment failure.

Feeder Performance (Oct 19-Sep 20)

Outage Cause by SAIFI	SAIFI	% of Feeder SAIFI
Foreign Contact	1.134	85%
Equipment Failure	0.182	14%
Vandalism	0.001	1%

Field Observations:

Feeder 15166 serves approximately 1,251 customers in southeast Washington D.C. Originating from the Alabama Ave Substation; this circuit provides service to both commercial and residential customers. This feeder is largely overhead (72% overhead and 28% underground), and emerges from the substation along Mississippi Ave SE near the intersection of 15th St SE. The mainline of the feeder takes off to the west along Mississippi Ave SE and branches off both north and south along 13th St SE as well as providing coverage to the north of Mississippi Ave NE along 6th St SE. Overall the condition of the poles, conductors, and equipment along this feeder are good and the areas that contain vegetation are well mitigated.

Previous Actions Taken (Past 3 years):

No previous actions have been taken on this feeder in the past three years.

Planned Remediation (Current Year):

Mainline:

Reconductor approximately 1,300’ of primary wire in the breaker zone and install fuses at unfused laterals.

Mainline work includes crossarms, fused cut-outs, lightning arrestors, animal guards, down-guys, head-guys, anchors and fault indicators.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete

Equipment Failure	0.017	1%
Tree	0.006	<1%
Unknown	0.002	<1%

Field Observations:

Feeder 14766 serves approximately 599 customers in northwest Washington D.C. Originating from the Little Falls Substation, most of this circuit consists of underground construction (30% underground, and 70% overhead). The Breaker Zone is almost entirely underground, rising up at the intersection of Fordham Rd NW and Tilden St NW then branching off to the north along Fordham Rd NW and running east along Upton St NW. The feeder also branches off through the mainline to several side streets. There is a large URD loop at the northwest end of the feeder. The feeder has consistent vegetation throughout the mainline, however the tree cover and undergrowth is not a substantial cause of issues on this circuit.

Previous Actions Taken (Past 3 years):

No work has taken place on this feeder in the previous three years.

Planned Remediation (Current Year):

Mainline:

Reconductor approximately 550’ of primary wire with covered treewire in the Breaker Zone and along 46th St NW.

Mainline work includes crossarms, fused cut-outs, lightning arrestors, animal guards, down-guys, head-guys, anchors and fault indicators.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments				

Completed Remediation Work: N/A

Anticipated Benefits:

Reconductoring the breaker zone portion of the feeder where copper primary wire exists will mitigate weak areas of the feeder and prevent issues with inadequate conductor size from causing issues on this feeder in the future. The minor work being performed as part of the priority feeder program will further improve the feeder performance and animal/BIL deficiencies, thereby providing added resiliency and more reliable service to the customers served by this feeder.

<u>Field Observations:</u>

Feeder 14005 serves approximately 472 customers in northeast Washington D.C. Originating from the 12th & Irving substation, most of this circuit consists of underground construction (39% overhead, 61% underground). The breaker zone is almost entirely underground, rising near the intersection of Bladensburg Rd NE and Channing St NE. The mainline of the feeder splits off at 30th St NE and runs north-south from Douglas St NE to Adams St NE. The mainline of the feeder runs east along Adams St NE until it intersects with South Dakota Ave NE. The last portion of the feeder runs along South Dakota Ave NE with overhead along the mainline and URD loops spurring from it. The equipment and poles on this circuit are in condition throughout, however there are some areas of vulnerability due to conductor size and insulation and equipment protection.

Previous Actions Taken (Past 3 years):

No work is performed within the last 3 years.

Planned Remediation (Current Year):

Mainline:

Reconductor approximately 4,700' of primary wire with covered treewire along Adams St and along South Dakota Ave.

Mainline work includes crossarms, fused cut-outs, lightning arrestors, animal guards, down-guys, head-guys, and anchors.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

Reconductoring the undersized primary wire on this feeder will mitigate weak areas of the feeder and prevent issues with inadequate conductor size from causing issues on this feeder in the future. The minor work being performed as part of the priority feeder program will further improve the feeder performance and animal/BIL deficiencies, thereby providing added resiliency and more reliable service to the customers served by this feeder.

Circuit: 14133

County	Substation	Customers Served	Number of Outages	Oct. 2019-Sept. 2020 Reliability Indices (In Hours)			Feeder Miles			Repeated Last 2 Years?

DC	Van Ness (129)	322	21	1.86[6]	203	108.9	59%	41%	7.23	N

Feeder Map and Location:

Outage Data Summary (Past 3 years):

2018: (Oct 17-Sep 18) Seventy four percent (74%) of twenty-three customer outages on this feeder were lateral events. Eight outages were caused by trees; four outages were caused by equipment failures; two outages were caused by animals; two outages were caused by weather and one outage event occurred due to an unknown cause. Twenty six percent (26%) of outages were mainline events. Three outages were caused by trees; two outages were caused by equipment failure and one outage event was caused by weather.

2019: (Oct 18-Sep 19) Sixty percent (60%) of fifteen customer outages were lateral outage events. Five outages were caused by trees; two outages were caused by weather; one outage was caused by animals and one outage was caused by equipment failure. Forty percent (40%) of customer outages were mainline events. All six mainline events were caused by trees.

2020: (Oct 19-Sep 20) Eighty six percent (86%) of twenty-three customer outages on this feeder were lateral events. Fifteen outages were caused by trees and five outages were caused by animals. Fourteen percent (14%) of customer outages were mainline outage events. Two outages were caused by animals and one outage event was caused by trees.

Feeder Performance (Oct 19-Sep 20)

Outage Cause by SAIFI	SAIFI	% of Feeder SAIFI
Animal	1.040	55%
Tree	0.826	45%

Field Observations:

Feeder 14133 serves approximately 322 customers in northwest Washington D.C. Originating from the Van Ness substation, most of this circuit consists of overhead construction (59% underground, and 41% overhead). The breaker zone is almost entirely underground, rising up approximately ten spans prior to the first recloser. The mainline emerges along Ablemarle St NW and heads directly east, then branches off to the north and runs along Linnean Ave NW. The mainline of the feeder also continues along Ablemarle St NW until the mainline ends shortly before Broadbranch Rd NW. This feeder is challenged by consistent tree outages along Broadbranch Rd NW, and the poles, devices, and conductors on the mainline of this circuit are in good condition.

Previous Actions Taken (Past 3 years):

No work is performed within the 3 years.

Planned Remediation (Current Year):

Mainline:

The mainline of this feeder will undergo a reconductoring upgrade to replace 1/0 Copper wire with 477 ACSR Treewire along Linnean Ave NW. Additionally, the feeder will be assessed for minor protection issues and will have lightning and animal protection improvements, as necessary. As a project separate from the 2021 Priority Feeder program, this feeder will be undergoing improvements along the lateral line on Broadbranch Rd NW. The existing conductor will be replaced with single phase spacer cable in order to mitigate tree risks.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The performance of this feeder was driven by animal and tree issues. The proposed work to replace and upgrade these conductors, poles, and equipment will improve performance for customers fed by this feeder.

Review of 2019 Priority Feeder Program (Least Reliable Feeders)

Activities conducted to improve the performance of each of the feeders in the 2019 Priority Feeder Program are identified in Table 2.4-A

Aggressive Correction Action Program[45]

Annual Program for Repeat Priority Feeders

The review of the 16 feeders selected for the 2% Priority Feeder initiative with previous year selections show that three feeders (15021 and 15094) which were in the 2019 Priority Feeder Program reappeared on the 2021 Priority Feeder Program. When a feeder repeats, additional aggressive corrective actions are implemented. All of the corrective actions listed in Section 2.4.1.2 will be completed in 2021.

2.4.1 RELIABILITY STATISTICS*

<u>**Service Reliability Indices**</u>

SAIDI, SAIFI, and CAIDI are the specific indices used and provide information about both the duration and frequency of outages for customers. These indices are described as follows:

SAIDI - System Average Interruption Duration Index. Designed to provide information about the average time (in aggregate) that the customers served in a predefined area are interrupted.

SAIFI - System Average Interruption Frequency Index. Designed to give information about the average frequency of sustained interruptions per customer served in a predefined area.

CAIDI - Customer Average Interruption Duration Index. Designed to provide information about the average time required to restore service to the average customer experiencing a sustained interruption.

Each index is calculated several times; once with all outage data and then according to the specific significant event exclusions specified. The expectation is that the indices calculated with significant event related outage data excluded will provide a reflection of system performance under normal operating conditions. The indices calculated with all outage data will provide a

[45] In Order No. 15152 issued on Pepco's 2008 Consolidated Report, the Commission stated (at paragraph 72):

72. PEPCO is DIRECTED, beginning with the 2009 Consolidated Report, to identify the feeders that are part of the separate annual program of corrective actions for reappearing least reliable feeders, describe the corrective actions planned for each feeder and the projected dates for completion of the corrective actions and explain whether the corrective actions improved the performance of these feeders consistent with paragraph 59 of this Order.

reflection of the impact of significant events on the system. It is important to note that a year-to-year comparison of reliability indices calculated with all outage data would not be appropriate. The indices during a year in which major storms or events impact an electric utility will be substantially different from the indices during a year in which no such issues arise.

Service Outage Statistics [46][47]

The 2020 year-end actuals for SAIFI and SAIDI were 0.40 and 44 respectively.

Presented in Table 2.4-B1-B2 are the SAIDI, SAIFI and CAIDI values for the past five years at IEEE- 2.5 Beta Criteria. These reliability indices are provided for all sustained interruptions and all sustained interruptions excluding major events. A sustained interruption is defined as an

---

[46] In Order No. 16623 paragraphs 48, 62 and 63, the Commission stated the following:
48. …Therefore, we hereby require that Pepco include reliability calculations using District of Columbia-only data and relying on a Major Service Outage exclusion in the 2012 Consolidated Report and in future Consolidated Reports. We also require that Pepco include in its 2012 Consolidated Report a revised version of its reliability calculations from the 2010 and 2011 Consolidated Reports using D.C.-only data and excluding Major Service Outages. Pepco shall also include calculations of reliability indices for the entire Pepco system using system-wide data and Major Event Day exclusions, as well as reliability indices for Pepco D.C. using D.C.- only MEDs in the 2012 Consolidated Report and in future Consolidated Reports, so that we may make comparisons. For purposes of this requirement, the "reliability calculations" contained in the Consolidated Report include all calculations of SAIDI, SAIFI and CAIDI, discussion of failure rate data, and selection of Priority Feeders. (Footnote: Because the Aggressive Corrective Action Program requires the identification of feeders that have been listed as Priority Feeders in the past using system-wide, MED-excluding data, we will allow Pepco to continue to select ACAP feeders using that data. However, we require that a list of Priority Feeders using the new method of calculation be included in the 2012 Consolidated Report.)
62. Pepco is DIRECTED to include in the 2012 Consolidated Report reliability calculations using District of Columbia-only data and excluding Major Service Outages consistent with paragraph 48;
63. Pepco is DIRECTED to include in the 2012 Consolidated Report a revised version of the reliability calculations contained in the 2010 and 2011 Consolidated Report using District of Columbia-only data and excluding Major Service Outages consistent with paragraph 48

[47] In Order No. 16700 issued February 12, 2012, paragraphs 10 and 11, the Commission stated:
10. In establishing out new reliability performance standards, we decided that Pepco should be given a reasonable amount of time to "ramp up" to our new requirements. Therefore, we made the new SAIDI and SAIFI standards effective beginning in 2013. By replacing the prior rule with a new one, and giving Pepco a transition period, we created a "gap" in reliability measures. We saw no harm in a temporary suspension of reliability benchmarks, recognizing that the standards in effect for 2013 through 2020 would require significant improvement on Pepco's part, starting at once. For example, in order to meet our 2013 SAIDI target, Pepco must make either about a 9% improvement in both 2012 and 2013 or about an 18% improvement in 2013. Therefore, we saw no risk that Pepco would suffer a significant "backslide" in reliability because there were no effective standards in place for 2011 or 2012.
11. We do not believe that reestablishment (for the years 2011 and 2012) of the standards to which Pepco was previously held is necessary. (Footnote: We note that not all states have Electric Quality of Service Standards. For example, Pepco presently operates in Maryland without standards but is required to provide annual reliability indices pursuant to COMAR 20.50.07.06.) Nor has Pepco provided any reason for that reestablishment. Consequently, we decline to make the clarification that Pepco requests. However, we do expect that Pepco will continue to report on its reliability performance in its annual Consolidated Report and we concur with OPC in its suggestion that Pepco coordinate its data reporting so that Pepco calculations are a consistent "apples to apples" comparison from 2011 through 2013 and beyond. Therefore, as OPC has requested, we require Pepco to include in its annual report a description of its performance and a calculation of whether it would have met the appropriate SAIFI, SAIDI and CAIDI standards had they been in effect.
14. Pepco shall include in its 2012 and 2013 annual Consolidated Reports calculations of SAIDI, SAIFI, and CAIDI as described in paragraph 11.

interruption of five (5) minutes or greater. Table 2.4-B1 shows performance indices including and excluding PEPCO major event days. Table 2.4-B2 shows performance indices including and excluding District of Columbia major event days only.

Order No. 16975 states the following at paragraphs 62 and 106:

*62. **Decision:** The Commission directs Pepco to provide SAIDI and SAIFI statistics in the future Consolidated Reports calculated by both including and excluding cross- border feeders. Pepco shall identify which feeders it treats as "cross-border" for this purpose.*

*106. Pepco is **DIRECTED** to provide SAIDI and SAIFI information consistent with paragraph 62 herein;*

District of Columbia Reliability Inclusive and Exclusive of Cross-Border Feeders (2020)

Table 2.4-B5

2020 IEEE MED Exclusive		
District of Columbia Reliability Statistics	SAIFI	SAIDI (Hours)
Excluding all cross-border feeders	0.29	0.55
Including all cross-border feeders	0.44	0.75

2020 DC MSO (& COMAR) Exclusive		
District of Columbia Reliability Statistics	SAIFI	SAIDI (Hours)
Excluding all cross-border feeders	0.31	0.61
Including all cross-border feeders	0.47	0.83
Table 2.4- B5		

*Note- COMAR is a Maryland criteria and MSO is a DC criteria.
MSO and COMAR are not compatible with each other.

Comparison of Cross-Border Feeder Reliability Performance[48]

Pepco calculates reliability indices on a feeder level in the same way regardless of the location of a feeder. For feeders that have customers in both the District of Columbia and Maryland, the indices for these feeders are included for reporting purposes with the jurisdiction in which the majority of customers on these feeders reside. Because feeders may switch between jurisdictions over time, to make their impact on reliability performance clear, Pepco presents system reliability performance both with and without both feeders assigned to the District of Columbia and Maryland, thereby allowing comparisons across different years.

Note: Feeders with two source substations listed are 4 kV primary network feeders and are supplied from two substations.

[48] The following is in response to the Commission's directive to:
[I]include in its 2015 Annual Consolidated Report an explanation of the metric or metrics it will use to report upon the reliability performance of its cross-jurisdictional feeders. This explanation is also to describe how Pepco's chosen metric(s) will allow reliability performance to be compared from year-to- year, when the jurisdictional status of a feeder changes between Maryland and the District
In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 241 (February 27, 2015).

15501- 15506 are part of the Little Falls Network Group and all are involved in serving at least one DC customer

14593 is part of the Sligo South LVAC Network group that supplies mainly Maryland Customers.

2.4.2 NEIGHBORHOOD ANALYSIS

Starting with Order No. 16623, the Commission has required a specific focus on neighborhoods in the Consolidated Report. This section addresses each of the neighborhood subjects required by the Commission.

In response to the Commission's requirements for reporting the neighborhoods impacted by reliability issues and remediation work, Pepco developed a comprehensive list of the feeders serving District of Columbia customers and the neighborhoods served by each in May of 2012. In order to provide neighborhood identification that is both accurate and consistent from one submission to another, Pepco is now using assessment neighborhoods as defined by the District of Columbia Office of Tax and Revenue (OTR) Real Property Tax Administration (RPTA). Pepco is assessing new methods to programmatically identify the neighborhoods each Pepco feeder serves and plans to further discuss these plans in the future.

Neighborhood Analysis Requirements

(A) Neighborhoods warranting infrastructure improvements due to increased load growth[49]

Response: See discussion for Neighborhood Item A below.

(B) Neighborhoods with decreased planned spending on 4 kV to 13 kV conversions[50]

(C) Neighborhoods with decreased planned spending on 4 kV to 13 kV conversions that are among previously identified Most Susceptible Neighborhoods[51]

(D) Explanation of how reduced conversion spending will improve reliability in Most Susceptible Neighborhoods[52]

Response: See discussion for Neighborhood Items B, C, and D below.

(E) Neighborhoods served by Priority Feeders

Response: See Priority Feeder discussion.[53]

---

[49] Order No. 16623 states the following at paragraph 35:
35. We find Pepco's explanation to be credible, but require further information on the neighborhoods in the District impacted by Pepco's changed plans. Specifically, we direct Pepco to identify those neighborhoods which warrant further infrastructure improvements due to increased load growth, including any explanation and data on Pepco's forecasts of load growth in those neighborhoods. (Footnote: In identifying neighborhoods, Pepco should use the methodology it used for defining and selecting neighborhoods in its May 20, 2011 submission to the Commission, or provide an explanation of why that methodology was not used. See F.C. Nos. 766, 982 and 991, Response of the Potomac Electric Power Company to Order No. 16347, May 20, 2011, Attachment 2.)…

[50] Order No. 16623 states the following at paragraph 35:
…Similarly, we require Pepco to identify those neighborhoods where planned spending on 4 kV to 13 kV conversion projects has decreased…

[51] Order No. 16623 states the following at paragraph 35:
…Further, we require that Pepco indicate if any of the neighborhoods it identifies pursuant to this paragraph is among the Most Susceptible Neighborhoods identified in Order No. 14626, Appendix A. (Footnote: See F.C. Nos. 766, 982, and 991, Order No. 16426, July 7, 2011, Appendix A.)…

[52] Order No. 16623 states the following at paragraph 35:
If any of the neighborhoods identified in this paragraph is among those Most Susceptible Neighborhoods, Pepco is directed to provide a full explanation of how its changed plans will improve reliability in that neighborhood.

[53] Order No. 16623 states the following at paragraph 46:
46. In connection with the second prong of our reliability efforts, our neighborhood initiative, we believe it is important to know whether any of the Priority Feeders are the feeders which serve the Most Susceptible Neighborhoods in the District. Beginning in the 2012 Consolidated Report, we require that Pepco identify the neighborhoods served by any Priority Feeders…

(F) Neighborhoods served by Repeat Priority Feeders[54]

Response: See Repeat Priority Feeder discussion.

(G) Neighborhoods served by equipment subject to failure data rate analysis[55]

Response: See Failure Data Rate Analysis discussion.

(H) Updated list of Most Susceptible Neighborhoods for Calendar Year 2011[56]

Response: See Neighborhood Item H, Most Susceptible Neighborhoods update below.

(I) Neighborhood information to be included in 2012 Consolidated Report[57]

Response: This information was included in the 2012 Consolidated Report as specified above.

(J) Directive to identify neighborhoods affected by changed plans[58]

Response: See discussion for Neighborhood Items A, B, C, and D below.

(K) Directive to provide information on neighborhoods[59]

Response: See discussion for Neighborhood Items E, F, G, H, and I.

Neighborhood Item A.

Neighborhoods with Increased Load Growth

---

[54] Order No. 16623 states the following at paragraph 46:
…and any Repeat Priority Feeder (those in the ACAP program). (Footnote: In identifying neighborhoods, Pepco should use the methodology it used for defining and selecting neighborhoods in its May 20, 2011 submission to the Commission, or provide an explanation of why that methodology was not used. See F.C. Nos. 766, 982 and 991, Response of the Potomac Electric Power Company to Order No. 16347, May 20, 2011, Attachment 2.)...

[55] Order No. 16623 states the following at paragraph 46:
…Further, we require that Pepco identify the neighborhoods served by any equipment subject to the failure data rate analysis proposed by Pepco at the October 18, 2011 PIWG meeting for inclusion in the 2012 Consolidated Report. (Footnote: See October 18, 2011 PIWG Meeting Minutes at 1.)…

[56] Order No. 16623 states the following at paragraph 46:
We also require Pepco to update its list of Most Susceptible Neighborhoods to identify the neighborhood in each Ward experiencing the most frequent non-major outages in Calendar Year 2011.

[57] Order No. 16623 states the following at paragraph 46:
…This information should be included in the 2012 Consolidated Report

[58] Order No. 16623 states the following at paragraph 55:
55. Pepco is DIRECTED to identify neighborhoods affected by changed plans consistent with paragraph 35;

[59] Order No. 16623 states the following at paragraph 60:
60. Pepco is DIRECTED to provide information on neighborhoods consistent with paragraph 46;

Pepco forecasts load by substation using identified PNB load along with the load reducing effects of net energy metering and conservation programs (and DERs generally) to develop short term forecasts and uses trends plus knowledge of future planned development to develop a long term forecast for each substation in the Pepco system.

There are areas where Pepco anticipates above average load growth, and these include the Mt. Vernon Square/Convention Center neighborhood (R.L.A.[60] (N.E.) assessment neighborhood), NoMa (R.L.A. (N.E.) assessment neighborhood), the Washington Navy Yard/Southwest (R.L.A. (S.W.) assessment neighborhood) neighborhood and the area around St. Elizabeth's Hospital and Columbia Heights.

Neighborhood Items B, C, D.

Neighborhoods with Decreased Planned Spending on 4 kV to 13 kV Conversions

Pepco does not currently estimate a material decrease in planned spending in 2021 compared to 2020 as conversions continue in the 12th Street SW, Georgetown, and North Capitol areas. Conversions will continue in North Capitol and 12th St. substations areas in 2021with the goal to have all load served by Spring of 2021 and Fall of 2021, respectively. Pepco is planning to complete the Anacostia 4 kV conversion project in 2021 with the conversion of the last remaining 4kV Feeder supplied from Anacostia Sub. 8.

Neighborhood Item F.[61]

Table 2.4-C lists the feeders that have appeared more than once on the 2% Priority Feeder list, the years they appeared, and the neighborhoods they serve.

[60] Redevelopment Land Agency.
[61] In Order No. 15941 issued on August 18, 2010, the Commission stated at paragraphs 13 and 16, the following:

Table 2.4-C

Feeder	Years Appeared on Priority Feeder List Since 2001	Neighborhoods

Neighborhood Item H.

Most Susceptible Neighborhoods by Ward with Most Frequent Non-Major Outages in 2020

Most Susceptible Neighborhood Analysis

Pepco was directed to provide analysis regarding the neighborhoods that were most susceptible to outages as determined by outage data. Pepco's original approach as previously filed was based upon identifying where there was a SAIFI / SAIDI impact on a Ward basis based upon the feeders that served specific neighborhoods in that Ward. Pepco has now taken a more defined geospatial approach of determining the most susceptible neighborhoods based on customer's experiencing multiple interruptions (CEMI) within that individual neighborhood. Neighborhoods in which greater than 250 customers experienced 3 or more outages in a single year within the last two years were selected. The outage analysis is inclusive of major service outages (MSOs) in order to capture the true experience of the customer. See Table 2.4D for the analysis of the most susceptible neighborhoods.

Table 2.4-D

Neighborhood	Ward	CEMI3+ 2019	CEMI3+ 2020	Priority Feeders 2020	Priority Feeders 2021
American University Park	Ward 3	43	955		14150,14766
Trinidad	Ward 5	8	935	15702	14712
Brookland	Ward 5	1	456		14022,14023
Cleveland Park	Ward 3	576	308	15867,14136	14150
Washington Highlands	Ward 8	0	276		14758,15166
Congress Heights	Ward 8	0	268		15166
Bellevue	Ward 8	630	190		14758
Deanwood	Ward 7	914	102	15707	
Benning Ridge	Ward 7	482	14	15130

Fort Dupont	Ward 7	370	4	15710	15709
Capitol Hill	Ward 6	2,486	0	211,15702,16002,16003	
Civic Betterment	Ward 7	357	0	15130	
Fort Davis	Ward 7	363	0	14035,328,15130	
Fort Lincoln	Ward 5	1,020	0	15094	14005
Marshall Heights	Ward 7	366	0	15130	372
Southwest Waterfront	Ward 6	701	0		

Table 2.4-E CEMIn Including Storms (MSO)

Year	CEMI3
2012	25.73%
2013	10.93%
2014	7.15%
2015	6.75%
2016	8.73%
2017	5.11%
2018	7.44%
2019	3.99%
2020	2.12%

From the analysis above, the 17 worst neighborhoods between 2019 and 2020 combined yielded 10 unique feeders to be remediated in 2021. Most of the feeders have been selected as part of a recent reliability program that also represents each neighborhood in this list. Additionally, the neighborhood list presented in this analysis represents 48% of the total DC customers that experienced three or more outages in 2020. See summary below:

- Feeders 15702, 15867, 14136, 15707, 15130, 15710, 00211, 16002, 16003, 14035, 00328, and 15094 were part of the 2020 Priority Feeder Program. The benefits on this work and other coincident work will be realized in 2021 and beyond.
- All remaining priority feeders are part of the 2021 Priority Feeder Program. The remediation work on these feeders is described above.

EQUIPMENT FAILURE RATES[62]

Pepco continues improvements to the quality of outage data. Outage data records are screened at multiple check points for accuracy. Control Center personnel review outage data daily for accuracy and make necessary edits to reflect actual circumstances. Asset Management staff performs several validation screens monthly to catch other data entry errors. Reliability Engineering staff daily review outage data and field crew comments as part of outage reviews, reliability improvement programs and when questionable data is encountered and works with Control Center staff to resolve remaining issues.

Analysis of Top Three Equipment Failure Modes[63]

This information identifies and analyzes the top three equipment failure modes in the District of Columbia with regards to total customers affected. In addition, it identifies feeders for corrective actions to remediate these failures in the future based on root cause determination where appropriate.

Analysis of Top Three Equipment Failure Modes[64]

This information identifies and analyzes the top three equipment failure modes in the District of Columbia with regards to total customers affected. In addition, it identifies feeders for

[62] Order No. 16975 states the following at paragraphs 95 and 118:
85. Decision: In its Comments, OPC identifies several instances in which outage data is inconsistent or erroneous. Pepco itself has identified several areas in which it can improve outage data quality. In an effort to ensure that the Commission and OPC is receiving accurate outage data, the Commission requires Pepco to report in its 2013 Consolidated Report on its efforts to improve the collection and accuracy of information regarding outages.
114.Pepco is DIRECTED to report on outage data quality improvement consistent with paragraph [95] herein.

[63] In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:
59. …(5)…If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

[64] In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:
59. …(5)…If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

corrective actions to remediate these failures in the future based on root cause determination where appropriate.

For purposes of this analysis, the following definitions are established.

- Events – number of outage events
- CI – number of customers interrupted
- CMI – Customer minutes of interruption
- SAIFI – System Average Interruption Frequency Index
- SAIDI – System Average Interruption Duration Index
- CAIDI – Customer Average Interruption Duration Index

Table 2.4-E details the reliability impacts of primary equipment failures tracked by Pepco

Based on the number of customer outages, as shown above in highlighted rows, the top three classes of primary equipment failures contributing to SAIFI are cable, bare wire and switch issues, accounting for 55.5% of total customers impacted and 53.3% of total customer minutes of interruption.

Cable Failure Analysis

Based on OMS data, the District of Columbia experienced 201 primary outages caused by cable failures during the period of analysis which affected 12,241 customers. There were 3 significant events that occurred accounting for 31.3% of the cable failure customer interruptions and 12.3 % of the cable failure customer minutes of interruption. The first event occurred on 6/4/2020 out of the Ft Slocum substation. A primary cable failure event occurred on feeder 15011 due to a getaway fault causing 1,473 customer interruptions and 34,026 customer minutes of interruption. Crews patrolled circuit, isolated and tagged OH cable before fully restoring load. A second event occurred on 9/12/2020 out of the Benning substation. A primary cable failure event occurred on feeder 14712 tripped due to getaway fault causing 1,319 customer interruptions and 196,726 customer minutes of interruption. Crews isolated UG cable repaired multiple faults and restored load. A third event occurred on 11/4/2020 out of the 12th & Irving substation. A primary cable failure event occurred on feeder 14008 due to a getaway fault causing 1,036 customer interruptions and 14,499 customer minutes of interruption. Crews isolated OH cable, repaired fault, and restored load.

Cables are selected for remediation based on outage history and repeat outages on sections of cable or repeat outages in neighborhoods. A program is in place to install interrupters on underground primary cable. An interrupter is a similar device to the recloser in that it can isolate the fault and restore service to customers that are not on the same section of the feeder as the outage. This will reduce the number of customer interruptions caused by cable failures and assist repair crews in locating the outage.

Table 2.4-F – Cable Failure Rates

2020 (Jan 1 - Dec 31)	Mode of Failure: Cable Failure (Primary)			
	CI	%	CMI	%
YE Total	12,241	42.09%	1,996,401	43.11%
3 Major Events*	3,828	31.27%	245,251	12.28%

Analysis of these 201 cable failure events as reported by OMS revealed that 31.3% of the customers impacted by cable failure can be attributed to three events. See summary below:

Table 2.4-F1 details the primary cable failure events causing the largest customer impact.

Table 2.4-F1 – Event Detail for Cable Failures

14008	12th & Irving	11/14/2020	1036	14,499	Feeder tripped due to getaway fault	3.06	42%	Repair made, no further action required
Total:			**3,828**	**245,251**				

Loose Connections Analysis

Based on OMS data, the District of Columbia experienced 37 bare wire related outages during the period of analysis which affected 2,212 customers. There were four significant events that attributed to 90.6% of the customers impacted and 89% of the customer minutes of interruption. The first event occurred on 5/19/2020 out of the 12th & Irving substation. Wires down on feeder 14023 accounted for 541 customer interruptions an d118,424 customer minutes of interruptions. Crews made repairs and restored all customers. The second event occurred on 8/2/2020 out of the 12th & Irving substation. A and C phase wires down on feeder 14023 accounted for 519 customer interruptions and 35,176 customer minutes of interruption. Crews made repairs and restored all load. The third event occurred on 7/2/2020 out of the Randle Hiland substation. C phase wires down on feeder 00118 accounted for 487 customer interruptions and 11,688 customer minutes of interruption. Crews repaired the C phase wire and restored all customers. The fourth event occurred on 6/12/20 out of the Benning substation. C phase wires down on feeder 15711 accounted for 456 customer interruptions and 62,184 customer minutes of interruption. Crews made repairs and restored all customers.

Table 2.4-G – Loose Connections Rates

2020 (Jan 1 - Dec 31)	Mode of Failure: Wire-Bare (Primary)			
	CI	%	CMI	%

Switch Failure Analysis

Based on OMS data, the District of Columbia experienced 32 switch related outages during the period of analysis which affected 1,680 customers. There were 2 significant events that accounted for 61% of the customer interruptions and 48% of the customer minutes of interruption. The first event occurred on 12/3/2020 out of the Florida Ave substation. A blown fuse box was found on feeder 15770 accounting for 584 customer interruptions and 82,147 customer minutes of interruption. Crews made ties to restore the load. The second event occurred on 7/4/2020 out of the Van Ness substation. An open switch was found on feeder 14146 accounting for 447 customer interruptions and 21,098 customer minutes of interruption. Crews made repairs and restored load to all customers.

Table 2.4-H Switch Failure Rates

2020 (Jan 1 - Dec 31)	Mode of Failure: Switch (Primary)			
	CI	%	CMI	%
YE Total	1,680	5.78%	214,468	4.63%
X Major Events*	1,031	61.37%	103,245	48.14%

* % related to the total number of primary bare wire events

Analysis of these 32 events as reported by OMS revealed that 61% of the customers impacted by switch failure can be attributed to two events. See summary below:

Table 2.4-H1 details the primary switch failure events causing the largest customer impact.

Order No. 16975 states the following at paragraphs 68 and 109:

68. Decision: *Pepco is directed to report on efforts to reduce equipment failure in the 2013 Consolidated Report and in future Consolidated Reports*.

109. Pepco is **DIRECTED** *to report on its efforts to reduce equipment failure consistent with paragraph 68 herein;*

Analysis of effort to reduce equipment failure rates

The analysis of the top three causes of equipment failure outages in the District of Columbia shows the impacts of ongoing efforts to improve Pepco's overall system and the effectiveness of numerous programs currently in progress as part of Pepco's Reliability program. As shown in the detail above, most of the issues that contributed to the top three equipment failure modes during the evaluation period have been or are scheduled to be addressed in various elements of the Reliability program. All other issues occurred on feeders with historically good performance and were repaired permanently at the time of the restoration and require no further action.

Improvements in the overall impact of equipment failures bear testament to the effectiveness of Pepco's Reliability program in identifying and remediating the most impactful equipment failure modes, ideally those which contribute to most customer outages. Programs such as DC PLUG, priority, and comprehensive feeder remediation, and recloser installation and ASR schemes are mitigating the impacts of equipment failures and providing better overall reliability for DC customers. Other pilot programs such as installing interrupters on the underground system are being analyzed to determine the benefits and how to employ them in the near future.

As noted in the above analysis, cable failure remains the largest contributor to customer outages caused by equipment failure. From this analysis there is no identifiable trend for the cable failures. Pepco is continuing to look at cable failures to identify sections of cable that have failed multiple times and is taking a proactive approach with its URD cable replacement program.

2.4.3 OUTAGE CAUSES

Interruptions to electric service can be caused by a range of occurrences, such as downed trees or limbs on power lines; high winds and lightning; heavy rain, snow, or ice; animals on equipment or power lines; traffic accidents that damage poles and equipment; underground construction accidents; and equipment failures.

The eight main outage causes in the OMS are:

- Animal – Outage caused by contact between Birds, Squirrels, Snakes and Other small animals and the distribution system;
- Equipment Failure - Includes Equipment Failures Only;
- Equipment Hit - Includes Cable Cuts, Motor Vehicle Hits and Foreign Contact;
- Others - Includes Employee, Fire, Load Shedding, Source Lost, Vandalism, Voltage;
- Overload - Includes Overloading only;
- Tree - Includes Outside ROW- Limb, Outside ROW-Down, Inside ROW-Limb, and Inside ROW-Down;
- Unknown - Includes Unknown Only indicates that the field responder did not know the cause of the outage; and
- Weather - Includes Flood, Ice, Lightning, Wind.

The following table reflects the outage cause options from which crews select when entering data into the Mobile application at the time of restoration. Through the Mobile NMS (Network Management System) completion window, crews have the ability to enter the event restoration information through drop down menus that are represented in the following table as well as any additional information through a free form text field. The outage cause selections are later classified into the categories above for reporting purposes. The detailed outage causes are maintained to assist in analysis of not only the cause of the outage but also the corrective actions necessary to reduce future outages.

An explanation of the selection categories from the drop-down menus follows Table 2.4-I below.

Table 2.4-I

- **Non-PHI** - If the event is not caused by Pepco equipment or if it is impossible to complete the request (e.g. bad address) crews must select one item from the Non-PHI list box of the MDS restoration screen indicating the circumstances, such as other utility, customer equipment, APGE (advise party to get electrician). If a selection is made from this list, the crew can complete and close ticket without further information. If no selection is made, then the event is on Pepco equipment and additional information is needed to complete the record.
- **Weather** - Crew must select from the list the observed weather conditions at the time of the outage.
- **Class** - Crew must select one item from the drop-down list describing the

construction type.

- **Device** - Crew must select the clearing device.
- **Action** - Crew selects the action taken to restore the event/outage.
- **Cause/problem** - Crew must select the cause of the event. A ticket cannot be closed without a cause selection if the event was on Pepco equipment.
- **Equipment Failure** - Crew must enter information about the failed device related to the event if equipment failure is the cause / problem selected.
- **Phase** - Selection box for the phase(s) impacted by the event/outage.
- **Manhole** - Selection box for items describing the contents of a manhole.
- **Follow-up Area -** For an event that needs additional work but does not require immediate attention, a crew may select a follow-up area. For example, in the case of a URD cable failure where all load is restored through a common tie, the event would have a follow-up selection.

The most common causes of power outages are equipment failures and vegetation. High winds, heavy rain or snow and ice can cause trees or branches to topple and tear down power lines. Tree limbs brushing or resting on the lines cause short circuits and blown fuses. As shown in Table 2.4-I, there are several different equipment types that fall under the "Equipment Failure" category. One such type is fuse-related outages. The job of the fuse is to protect equipment. If a fuse blows, it is not an equipment failure but rather the fuse is performing its designed function. As a result, there are fewer actual "Equipment Failures" than are captured by the OMS.

If a non-Pepco construction crew digs a foot or two in the wrong direction, damage to an underground power line could cause an instant disruption of electric service or could cause damage that may not result in a power outage until days, weeks or months later.

Vehicles that damage utility poles or equipment can also cause power outages. Small animals, like squirrels, sometimes chew into lines or come into contact with a piece of equipment and an energized line, causing a fault and subsequent interruption of electric service.

An event classified as "Unknown" indicates that the field responder did not know the cause of the outage and this classification is used most frequently where a service interruption results from the operation of a protective device such as a fuse or recloser. These devices protect the electric distribution system from damage by sensing fault current on a particular circuit and activating a break in the flow of current. Typically, if there is no discernable damage to the circuit and the cause of the fault is not evident in the vicinity of the protective device that was activated, the device will be replaced or reset and the circuit re-energized. If the device holds (no fault current is detected), the field responder may report “Equipment Failure” or "Unknown" as a cause and move on to the next trouble call assigned. The operation of these protective devices are not equipment failures because the fuse or recloser is operating correctly when it opens to isolate a fault further down the line. Occasionally, the field responder may find a probable cause some distance from the protective device involved (such as a tree branch on the ground underneath the overhead lines), but, for the most part, crews are focused on restoration of service rather than full investigation of the cause of any interruption (where this is not immediately evident).

Tables 2.4-J contains District of Columbia outage cause data for calendar year 2020.

VM BUDGET, TREE-RELATED OUTAGES[65][66]

Table 2.4-K1 shows District of Columbia distribution tree trimming expenses (not including poles, substation mowing, or storm-related tree trimming) and budgets. Provided are actual and budgeted amounts for 2013-2020 and the 2021 budget.

Pepco's VM program includes increased trimming above all three-phase and single-phase lines. For three-phase lines it also includes the removal (with permission) of any limbs identified by Pepco Arborist planners that have a probability of breaking and falling into the conductors.

[65] In Order No. 16623 at paragraphs 37 and 56, the Commission ordered the following:
37. Decision: …We require Pepco to explain why it has decreased its budget for tree trimming over the last seven years, if tree trimming is the most important factor impacting customers suffering from power outages. Pepco should include that explanation in the 2012 Consolidated Report.
56. Pepco is DIRECTED to provide an explanation of its budget for tree trimming consistent with paragraph 37.
[66] Order No. 16975 states the following at paragraphs 43 and 99:
43. Decision: The Commission finds Pepco's explanation of its budget variance for the single year 2011 insufficient to explain budget variances that totaled 26.9% below budget for five of the last six years. Therefore, the Commission requires Pepco to explain the budget variances that have occurred from 2006-2011 in its 2013 Consolidated Report. Additionally, we agree with Staff Recommendation #3 and require Pepco to include an explanation of any budget variance in its vegetation management expenditures and its EIVM expenditures in future years' Consolidated Reports. We are extremely concerned about the explanation provided in the Consolidated Report for why vegetation management expenditures were below budget in five of the last six years. Pepco stated that "while actual expenditures were below budget, work was completed consistent with planning." This is an inadequate explanation for a repeated failure to spend budgeted amounts on tree-trimming – arguably, the "most important factor impacting customers suffering from power outages." We therefore require Pepco to expand upon its explanation. If Pepco means that, through efficiencies, all the work intended to be accomplished in the budget was actually accomplished for less, then we direct Pepco to document what was intended to be included in the budget and what efficiencies were achieved so that the budgeted work was accomplished at a lower cost. The Commission also requires Pepco to explain what impact these efficiencies had on the budget process in subsequent years. If Pepco's statement about planning has some other meaning, we direct Pepco to provide it and to show what "planning" was involved, by whom and when. We also expect a precise and detailed explanation of why such planning would result in expenditures consistently, and significantly, below the budgeted amounts for a number of years. Further, we agree with OPC's suggestion that Pepco explain why its program does not include increased trimming above the three phase tap line or the single tap lines. Pepco is directed to provide this information in the 2013 Consolidated Report.
99. Pepco is DIRECTED to provide an explanation of budget variances for its own vegetation management work as directed in paragraph 43 herein;

Explanation of Variance in Pepco D.C. O&M Tree Trimming Costs

In 2020, there was variance of $316,388 (underspent), or approximately 13% percent, from the annual VM budget. Due to vegetation management's aggressive routine maintenance program, the cyclical costs associated with the program have reduced. Since DC is on a two-year schedule, all feeders are inspected and maintained every two years. This has resulted in less associated maintenance costs for the program.

Table 2.4-K1

Pepco District of Columbia O & M Tree Trimming Costs								
	2013	2014	2015	2016	2017	2018	2019	2020
Actual								
Tree Trimming - DC	$2,352,567	$2,164,336	$2,238,654	$2,269,634	$2,365,759	$1,705,410	$2,124,929	$2,052,518
Budget/Forecast								
Tree Trimming - DC	$2,218,342	$2,113,300	$2,324,572	$2,335,008	$2,412,774	$2,480,616	$2,522,296	$2,368,906
Variance	($134,225)	($51,036)	$85,918	$65,374	$47,015	$775,206	$397,367	316,388
Tree Trimming - DC								
Notes:								
1. Excludes pole inspections, substation mowing costs								

Yearly Data on Tree Trimming & Tree-Related Outages

In accordance with Order No. 15621,[67] presented in the following tables, is Pepco's "yearly data on vegetation management by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports." The tables list the outages coded as tree-related in 2020, also sorted by feeder, allowing for a comparison between the two sets of tables. It is possible that additional outages may have been caused by trees but with causes coded as weather or unknown if fallen trees or limbs were not found at the site.

[67] In Order No. 15621 at paragraph 5, the Commission ordered the following:
5. Pepco shall file within the Company's annual Consolidated Reports to the Commission, yearly data on tree trimming by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports beginning with the Company's 2010 Consolidated Report.

Pepco tracks the District of Columbia System Tree SAIFI and SAIDI to measure the effectiveness of VM. Tree SAIFI and SAIDI measures the level of vegetation-caused outages. The following tables present data showing the System Tree SAIFI and SAIDI (in minutes) for the Pepco District of Columbia service territory for 2015 to 2020, based on the Major Service Outage ("MSO") exclusion criteria.

Table 2.4-K4

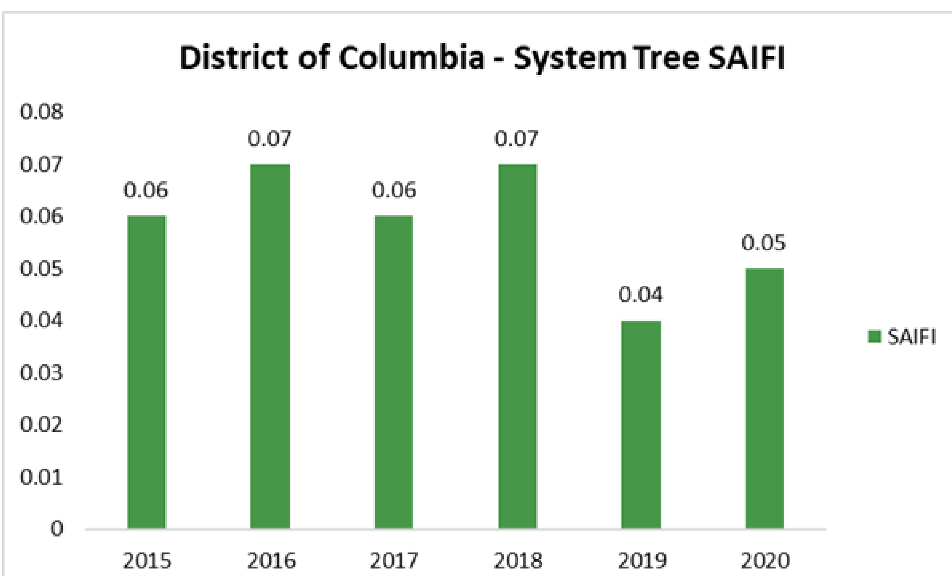

Table 2.4-K5

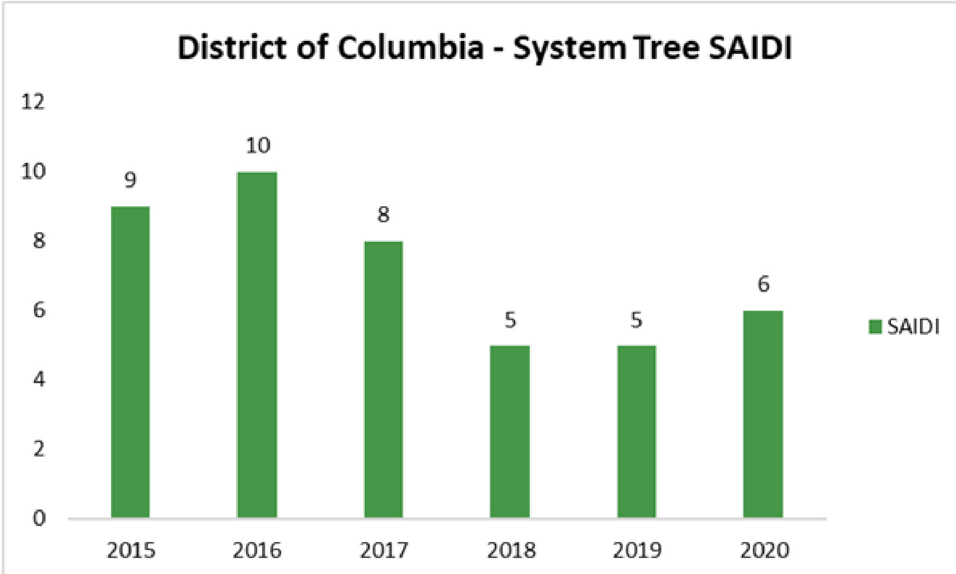

2.4.4 ELECTRICITY QUALITY OF SERVICE STANDARDS (EQSS)

The Commission introduced the EQSS to establish standards and requirements for ensuring that electric utilities operating in the District of Columbia meet an adequate level of quality and reliability in the electric service provided to District residents. On February 29, 2008, the Commission issued a Notice of Final Rulemaking (NOFR) on the EQSS. The EQSS are now adopted as Chapter 36, Electricity Quality of Service Standards in Title 15 of the District of Columbia Municipal Regulations. Subsequently on July 25, 2008, the Commission issued a NOFR on Compliance Reporting. Pepco and all electricity suppliers within the District of Columbia were directed to collect EQSS data on a monthly basis and retain the reporting data for seven (7) years. Further, quarterly submissions, containing monthly data, are to be filed with the Commission on April 30, July 30, October 30 and January 30 for the prior three (3) months respectively. Specific Consolidated Report requirements from the EQSS portion of the D.C.M.R. are listed on the footnote.[68]

[68] Progress on current corrective action plans [on customer calls answered] shall be included in the utility's annual Consolidated Report.

Electricity Quality of Service Standards Results

January – December 2020 Aggregate Totals

The utility shall report the actual call center performance during the reporting period in the annual Consolidated Report of the following year.

Progress on any current corrective action plans [on call abandonment rates] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.

Progress on any current corrective action plans [on new residential service installation requests] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3603.5 The utility shall report on the progress of the corrective action plan [on repeat least performing feeders] in the Annual Consolidated Report submitted to the Commission.

The utility shall report on the number and percentage of non-major service outages that extend beyond the twenty-four (24) hour standard and the reasons each such outage extended beyond the twenty-four (24) hour standard.

The report drafted pursuant to Section 3603.8 shall be included in the annual Consolidated Report on reliability data.

The utility shall report on the progress of the corrective action plan [on SAIFI, SAIDI and CAIDI benchmarks] in the annual Consolidated Report submitted to the Commission.

The utility shall also, per the orders of the Commission, continue current requirements of reporting annual reliability indices of SAIFI, SAIDI and CAIDI (with and without major events) in the annual Consolidated Report of the following year.

3601	**Reporting Requirements for Service Outages, Incidents and Power Quality Complaints**							
	Standards		**2020 Aggregate Totals**					
Section	Standard	Measure	Total # of Events	% Compliant (w/measure)	Corrective Action	Due Date	Status
3601.2/ 3601.6	Report major and non-major service outages by telephone and e-mail within one (1) hour after the utility has determined that a major service outage occurred or after the utility becomes aware of the incident.	Report by telephone and e-mail **within one (1) hour.**	247	100%	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 30, 2020; July 30, 2020; October 30, 2020; and February 1, 2021.		
3601.3/ 3601.8	Each telephone and e-mail report on major and non-major outages should contain a) the location, b) Wards affected, c) # of customers out of service, d) cause of the outage, e) the estimated repair time, and, for major outages, f) notification of progress to major outage status.	Each 3601.3 report must contain **(a) - (f)**, each 3601.8 report must contain **(a) - (e)**.	247	100% (Except for ward data)	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 30, 2020; July 30, 2020; October 30, 2020; and February 1, 2021.		
3601.4	Report periodically (frequency to be determined by the Commission's Office of Engineering) regarding the status of the major service outage.	**TBD**	NA	NA			

3601	**Reporting Requirements for Service Outages, Incidents and Power Quality Complaints**						
	Standards		**2020 Aggregate Totals**				
Section	Standard	Measure	Total # of Events	% Compliant (w/measure)	Corrective Action	Due Date	Status
3601.5	Specific restoration information, including restoration times, shall be provided to District customers by customer service representatives and the automated voice response unit.	**TBD**	NA	NA			
3601.9/ 3601.11	Report by telephone all manhole incidents (smoking manholes, manhole fires, manhole explosions) and all incidents that result in the loss of human life and/or personal injury requiring hospitalization within thirty (30) minutes upon receiving notice of the incident.	Report **within 30 minutes** of receiving **notice of incident.**	5	100%	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 30, 2020; July 30, 2020; October 30, 2020; and February 1, 2021.		
3601.10/ 3601.12	Telephone and e-mail reporting of incidents to include: a/b) location/description of the incident, b/c) Ward, c/d) customers and/or persons affected, d/e) cause of incident, e) estimated repair and/or restoration time (for manhole incidents), and f) steps utility will take to provide assistance (for personal injury incidents).	**Each 3601.10 report must contain (a) - (e)**, each 3601.12 report must contain **(a) - (f)**.	5	100% (Except for ward data)	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 30, 2020; July 30, 2020; October 30, 2020; and February 1, 2021.		

3601	**Reporting Requirements for Service Outages, Incidents and Power Quality Complaints**							
Standards			**2020 Aggregate Totals**					
Section	Standard	Measure	Total # of Events	% Compliant (w/measure)	Corrective Action	Due Date	Status
3601.13/ 3601.15	Written reports concerning non-major service outages and/or manhole incidents shall be submitted to OE and OPC within five (5) days from the date of the event occurrence. Written reports on the loss of human life/personal injury shall be submitted within five (5) days of receiving notice of the incident.	Submit 3601.13 report **within 5 days of event,** and 3601.15 report **within 5 days of receiving notice.**	247	98%	See FC Nos. 982 & 1002, Pepco's Quarterly EQSS filings dated April 30, 2020; July 30, 2020; October 30, 2020; and February 1, 2021.		
3601.14/ 3601.16	At a minimum: each written report on non-major service outages and/or manhole incidents shall state, a) description, b) location, c) Wards, d) time of the outage, e) repair and restoration times, f) duration of outage(s) in hrs/min., g) total # of customers, h) total # of manholes, i) classification of the manhole incident(s); each written report on loss of human life and/or personal injury shall state, a) description, b) location, c) Ward, d) exact time, e) total # of customers, f) assistance steps, g) time it took assistance to arrive, h) steps to prevent reoccurrence.	Each 3601.14 report must contain **(a) - (i)**, each 3601.16 report must contain **(a) - (h)**.	247	100%			
3601.17	Provide a detailed report on non-major service outages, manhole incidents, and/or incidents that result in the loss of human life or personal injury to the Productivity Improvement Working Group (PIWG) every quarter.	Submit all applicable reports to the PIWG **every quarter**.	0	100%

Commission shall determine whether further investigation is necessary.	Report must contain **(a) - (f).**	2	100%			

Non-Major Outages, Restoration Completion Within 24 Hours

In accordance with Section 3603.8 in the EQSS, Pepco is to include in the Consolidated Report the number and percentage of non-major customer outages that extend beyond the 24-hour standard and the causes for these extended service outages. A Major Service Outage in the District of Columbia, as defined in Section 3699.1, Definitions, of the EQSS states, *"customer interruption occurrences and durations during time periods when 10,000 or more of the electric utility's District of Columbia customers are without service and the restoration effort due to this major service outage takes more than 24 hours."*

Table 2.4-I provide the required information.

For 2020, there was 1 (of 247) non-major outages that extended beyond 24 hours.

Percentage of Non-Major Outages that Extended Beyond 24 Hours

Table 2.4-L

Total number of Non-Major Outages extending beyond 24 hours	5
Total number of Non-Major Outages: January 1 - December 31, 2020	247
Percentage of Non-Major Outages extending beyond 24 hours	2%

52	77	DC20-07	JUNE	9	UG	Manhole fire was reported by DC Fire Dept. A solid primary manhole cover was found displaced, no smoke and no fire. The crew found a failed 500 3/C PILC in duct line. Crew replaced cable. Event #2688783	3220 Connecticut Ave & Macomb St, NW	NW	3	1149	2325 (6/11)	59	30	5	This event occurred due to circuit failure. Feeder tripped and fire was reported. Feeder had to be cleared and station tagged. Repairs required the replacement of 670 feet of PILC and EPR cable.	14148R
61	101		JUNE	21	OH	Manhole Network Cable Failure/ feeder tripped; services dropped (15378) – Permanent repairs, services restored. Event# 2694797	1025 Connecticut Ave NW	NW	2	1365 (6/19)	701	41	6	1	This was a significant event that impacted multiple circuits. Repairs required replacing several stretches of cable in multiple locations.	15378
77	126		JULY	21	UG	Cable failure/services dropped (00063) - Temporary repairs, restored services. Event# 2710830	Vicinity of 34th St NW & Massachusetts Ave	NW	3	1656 (7/20)	2239	29	43	6	This event was an outage on 4KV circuit. This outage had a long duration due to repairs that had to be made to another 4KV circuit that was also damaged. Work was also required by overhead crews in order to isolate and ground circuit which took substantial time. Portable generation was provided to several customers in an effort to minimize disruption.	63
80	144		JULY	24	UG	Cable failure/service dropped (15204) Event# 2713987- Permanent repairs, services restored.	421 Q St NW	NW	2	1411 (7/23)	2126	31	14	1	This event was on a 13kV distribution feeder. Load was tied off after the fault was isolated. Permanent repairs were delayed due to resources needing to be called in off shift.	15204
85	154		AUGUST	2	UG	Cable failure/service dropped (15706) -Repaired, permanent repairs Event# 2718986	320 40th St NE	NE	7	1046 (8/1)	1157	25	11	1	This event was a B & C phase fault to a customer's switch gear. Customer coordination delayed the repairs, and assistance from overhead crews was also required. Customer also wanted repairs to be completed off shift since they still had partial power and were able to operate at limited capacity.	15706

PART 3: 2020 MANHOLE EVENT REPORT

PART 3: 2020 MANHOLE EVENT REPORT[69]

Part 3 of the Consolidated Report includes manhole event information, underground failure analysis results, detailed tracking trends in reportable events based on manhole cover type, and Pepco's cable splice records for 2020. The appendices provide detail regarding manhole events, and Pepco's manhole inspection program.

SECTION 3.1 – 2020 MANHOLE EVENT INTRODUCTION

Pepco herein submits its annual Manhole Event Report for 2020 in accordance with Order Nos. 11716, 13812, 15620 and 16091.

[69] In Order No. 16091 issued on December 10, 2010, the Commission stated at paragraphs 56, 59, 65, and 66 the following:
56. Decision. Pepco has agreed to make the recommended changes in the 2011 Consolidated Report with the exception of data on failure rates. We require that the members of the PIWG discuss the need for and feasibility of providing data on failure rates in future Consolidated Reports and include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.
59. Decision. We adopt the Staff's recommendation and require Pepco to: (1) combine the Manhole Events portion of the failure analysis report with Part 3 of the Consolidated Report; (2) include data in the 2011 Consolidated Report that separates 4 kV primary failures from 13 kV primary failures;
(3) include data in the 2011 Consolidated Report that separates 4 kV from 13 kV manhole events; (4) include trend analyses for "Use of Slotted Manhole Covers;" and (5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable. If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.
65. Pepco IS DIRECTED to include a discussion of failure data rates in the agenda for the Productivity Improvement Working Group, consistent with Paragraphs 56 and 59 of this Order; and
66. Pepco IS DIRECTED to include additional Manhole Event data in the 2011 Consolidated Report, consistent with Paragraph 59 of this Order.

In Order No. 15152 paragraphs 76 and 66, the Commission ordered the following:
76. PEPCO is DIRECTED to include as part of the 2009 Consolidated Report a proposed plan for significantly reducing manhole events consistent with paragraph 66 of this Order…

Summary of 2020 Manhole Events

During 2020, there were a total of 22 reportable manhole events in the District of Columbia. Of these 22 manhole events, 13 were classified as Smoking Manholes (S), 5 were classified as Manhole Explosions (E), and 4 were classified as Manhole Fires (F). 13 out of the 22 events occurred on the 13 kV system. Of these, 7 were classified as Smoking Manholes (S), 4 were classified as Manhole Explosions (E) and 4 were classified as Fires (F). The 2 events occurring on the 4 kV system were classified as Smoking Manhole (S). Appendix 3A is a list of the 2020 manhole events, categorized and described as directed in Order Nos. 11716, 13812, 15620 and 16091.

SECTION 3.2 – UNDERGROUND FAILURE ANALYSIS

Order No. 17074 Requirement

38. *The Order further noted OPC's statement that according to Pepco, its replacement program would screen all feeders by collecting the number of underground faults experienced by each feeder in the last ten years and feeders with five or more faults ("5-in1-10") would be further analyzed for replacement. [Footnote: See F.C. 766-ACR-12, Order No. 16975, paragraph 75.] ...Thus, we direct Pepco to report on the results of its screening program along with Pepco's recommendations for further analysis and replacement in the ACR starting with 2013.*

40. *... Some progress should have been made in the development of a tracking mechanism for PILC actual replacement and Pepco should be able to report on the actualization of its strategy with data that will help the Commission to better understand Pepco's future plans for PILC replacement and examine the results of its PILC Replacement Strategy. Thus, the Company is required to report on the actualization of its PILC Replacement Strategy in the ACR and to include in the report the information identified in Recommendations 8(c), (d) and (e). If the requested information is not available, Pepco shall provide a reasonable substitute that will allow the Commission to assess the progress that Pepco has made and intends to make in the implementation of its PILC Replacement Strategy for the ten-year period from 2012 to 2021.*

Pepco Response – Corrective Actions

Pepco is currently in the process of analyzing available data of the underground electric system faults in the District of Columbia. Feeders with at least five faults within ten years were identified for further analysis. From that list of feeders, those that are already being addressed as part of Pepco's Reliability program and/or other strategies—or programs that would address these issues on the feeders—were removed to avoid duplication of efforts.

In 2020, targeted PILC replacement was performed on eight feeders, shown below in Table 3.1.

Table 3.1: PILC Replacement Status

Year	Feeder ID	PILC Replaced (ft)
2020	15307	4629
2020	15308	7717
2020	15309	7081
2020	15310	7434
2020	15311	5056
2020	15312	5733
2020	14531	2490
2020	14537	1149

In Pepco's 2001 "Alternative Design Proposal to Pepco's 15kV Paper Insulated Lead Covered Power Cables (PILC)" study, Pepco estimated there were 1,109 miles of primary lead cables on the Pepco system in the District of Columbia. Given the current configuration of the District of Columbia underground system, which includes varied duct and manhole sizes, it is not possible to know how many of those miles are non-replaceable. Reconfiguring the manholes and ducts would allow most of Pepco's PILC cable to be replaceable, albeit at significant cost and time. As stated in Pepco's PILC Replacement Strategy, in line with most other electric utilities and with industry best practice, Pepco has not committed to replacing a fixed number of miles of PILC each year and has not identified a year by which full replacement of primary PILC would be expected. Instead, Pepco is seeking opportunistic replacement based on conditions, which it expects to be a more cost-effective replacement strategy.

Consequently, Pepco cannot provide an estimate of the number of miles of PILC that will be replaced by EPR for the 10-year period from 2012 through 2021. Since 2001, Pepco has replaced 83 miles of PILC in the District of Columbia both through the opportunistic replacement approach, and planned jobs. This data is reflected in Table 3.2 below.

Table 3.2: PILC Replacement: 2001-Present

Years	*PILC Replaced Footage*	*PILC Replaced Mileage*
2001	0	0

2020	41,289	7.82
Total	***440,350***	***82.52***

Underground (UG) Failure Analysis

The results of Pepco's annual UG failure analyses are presented below, in compliance with Order No. 12735 paragraph 138.[70]

In analyzing the performance of the Pepco UG system, it is necessary to distinguish three different measures of system performance:

- Equipment Failures
- Outages
- Reportable Events (RE)

An RE is a reported explosion, fire, or smoke in a manhole. Some Pepco equipment failures may result in customer outages, REs or both. However, not all Pepco equipment failures result in an outage and/or an RE. This is due to the redundancy of some components of the system, especially on secondary networks. In fact, for the underground secondary networks, most equipment failures do not result in customer outages because each network is fed by multiple primary feeders, and each customer can be fed from multiple transformers and secondary mains, making them less susceptible to outages. Further, some underground outages or events are not initiated by equipment failures, but are in fact caused by accidents, such as dig-ins by excavation contractors, failures of non-Pepco equipment, such as District of Columbia owned streetlight cables or gas company equipment.

There are three types of manhole reportable events:

- Explosions
- Fires
- Smoking

Of these three types, from 2016 – 2020 smoking manhole events account for most of all manhole events experienced in the District. See Figure 3.3.

[70] In Order No. 12735, paragraph 138, the Commission ordered the following:
138.Pepco shall file a report that summarizes the results of the failure analyses conducted for the calendar year 2002, 30 days from the issuance date of this Report and Order, and subsequently, to file an annual report on the results of the failure analysis group to the PIWG;

Figure 3.3: Manhole Events - Smoking (2016-2020)

	2016	2017	2018	2019	2020
All Events	67	44	55	43	22
13kV Smoke	44	32	38	30	11
4kV Smoke	6	4	1	3	2
% Smoking	75%	82%	71%	77%	59%

Year

Figure 3.7 breakdown the number of manhole fires and manhole explosions as compared to the total number of events. As reflected below, explosions and fires occur less frequently than smoking manholes.

Figure 3.4: Manhole Events - Explosions (2016-2020)

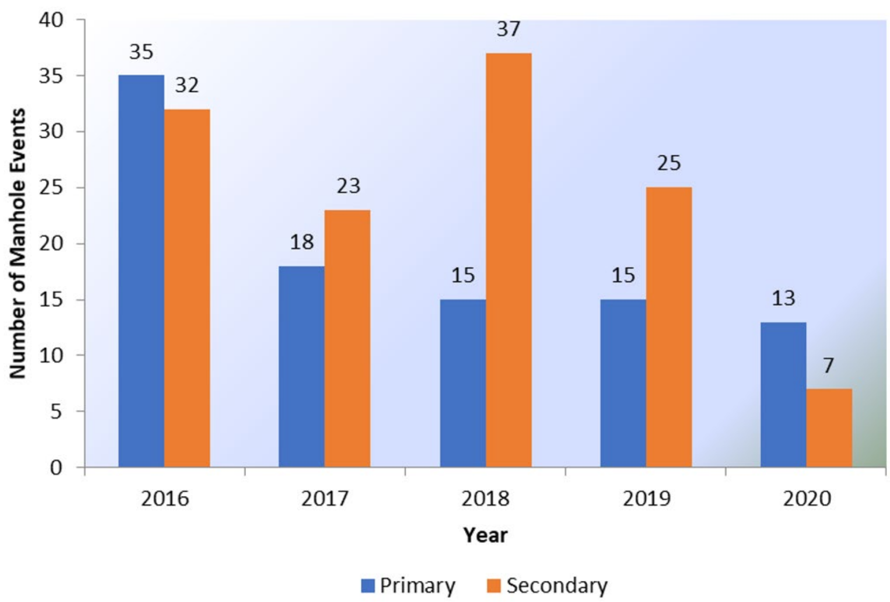
13kV Fires	9	5	5	8	4
4kV Fires	1	1	0	0	0
% Fires	15%	14%	9%	19%	18%

Year

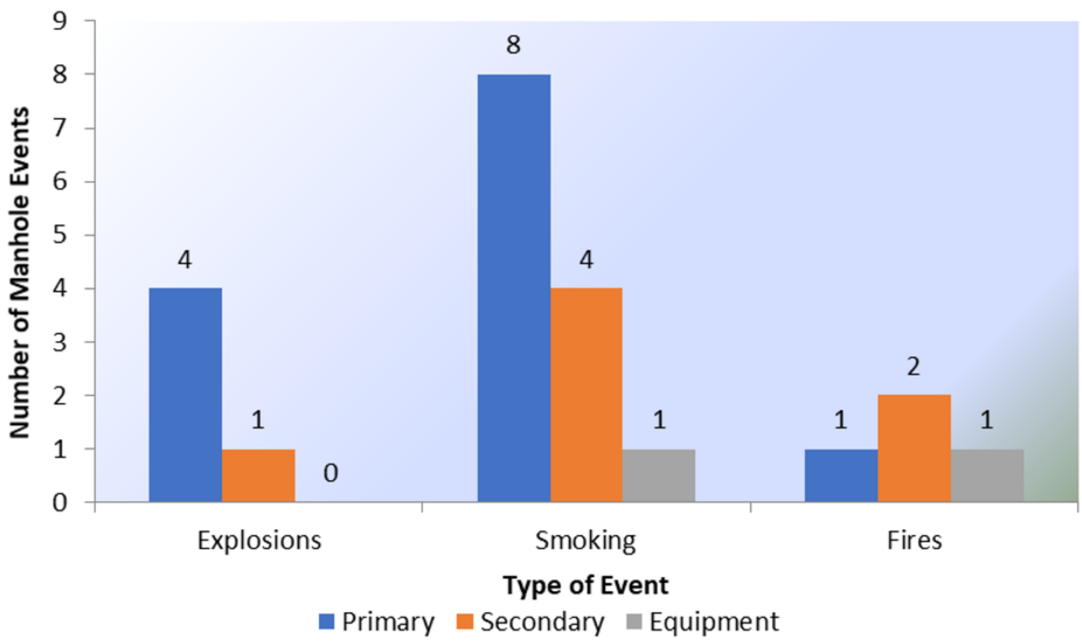
Since 2016, on average most of the manhole events experienced in the District have occurred on Pepco's secondary equipment. See Figure 3.6.

Figure 3.6: Manhole Events by Type of Equipment (2016-2020)



In 2020, two manhole fires occurred on the secondary systems. Smoking manholes occurred more on the primary system, and manhole explosions occurred more on the primary system. Figure 3.7 below depicts this breakdown.

Figure 3.7: Manhole Events by Type and Equipment (2020)



Slotted manhole covers are designed to minimize the frequency and impact of manhole events by allowing gas and smoke to vent from manholes in the event of an underground failure. This provides an early warning and prevents build-up of gases to potentially explosive proportions; thereby allowing energy to disperse more easily should an event occur. The tradeoff when installing slotted covers is that they allow more water and street run-off contaminants to enter the manhole than solid covers. More analysis on the effects of slotted covers and manhole events is presented in the slotted MH cover section of this report. See Figure 3-8 and Figure 3-7 for a breakdown of manhole event by event type, voltage class, and cover type.

Figure 3.8: Manhole Events by Type, Equipment, and Manhole Cover (2016-2020)

	2016	2017	2018	2019	2020

Slotted Smoking	16	14	18	7	1
Slotted Fire	4	1	2	1	1
Slotted Explosions	0	0	0	1	0

By design, primary cable is more insulated than secondary cable. Whereas primary cable and its accessories are designed to their voltage rating and are shielded, secondary cable and its accessories are not shielded. As a result of less physical protection, secondary cable and its accessories are more likely to fail due to a breach in the insulation. Since 2016, the leading cause of manhole reportable events in the District is insulation-related, such as insulation deterioration. See Figures 3.10 through 3.14.

Figure 3.10: Selected Failure Causes (2016)

Cause	13	8	2	29	1	2

Figure 3.13 Selected Failure Causes (2019)

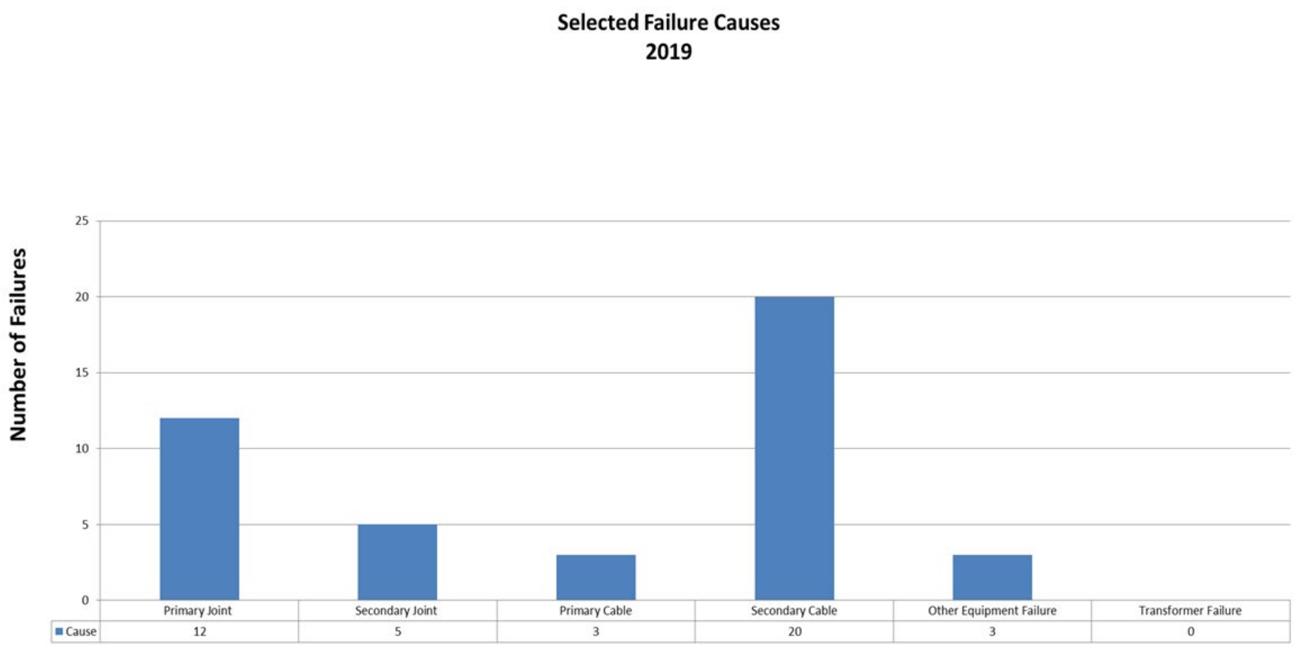

Figure 3.14 Selected Failure Causes (2020)

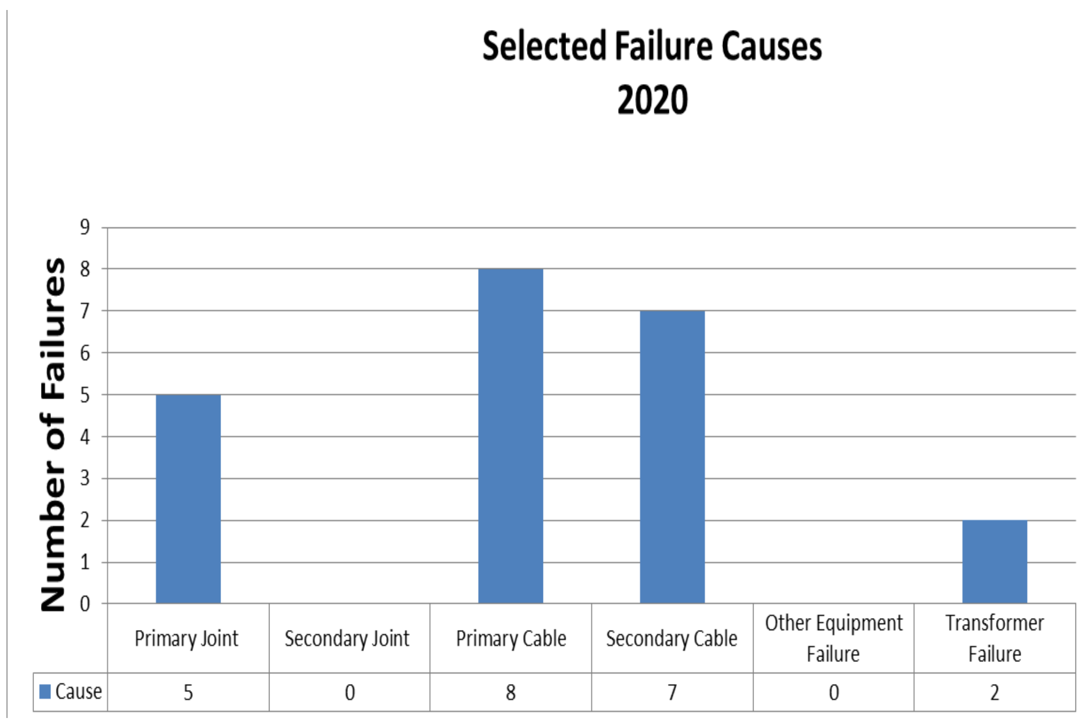

Selected Failure Causes (2020)

The type of insulation related to cable and joint failures resulting in a reportable event for secondary equipment does not provide a discernible trend in reportable events caused by Rubber Lead (RL), Rubber Neoprene (RN), or other insulation types (Figure 3.13). RL secondary cable is an outdated technology and has not been installed on the system for more than twenty years. It is not possible to trend future reportable events associated with this cable type.

Figure 3.15: Insulation Type of Secondary REs (2011-2020)

	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020

RN	29	7	14	30	52	20	14	22	15	5
Other	3	1	2	4	2	7	2	7	2	13

Year

PILC is the predominant primary cable on the Pepco underground system. Consequently, most primary cable reportable events involve PILC cable (Figure 3.16).

Figure 3.16: Insulation Type of Primary REs (2011-2020)

	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
PILC	24	17	13	22	6	29	15	8	11	8
RL	0	0	2	2	1	1	3	0	0	2

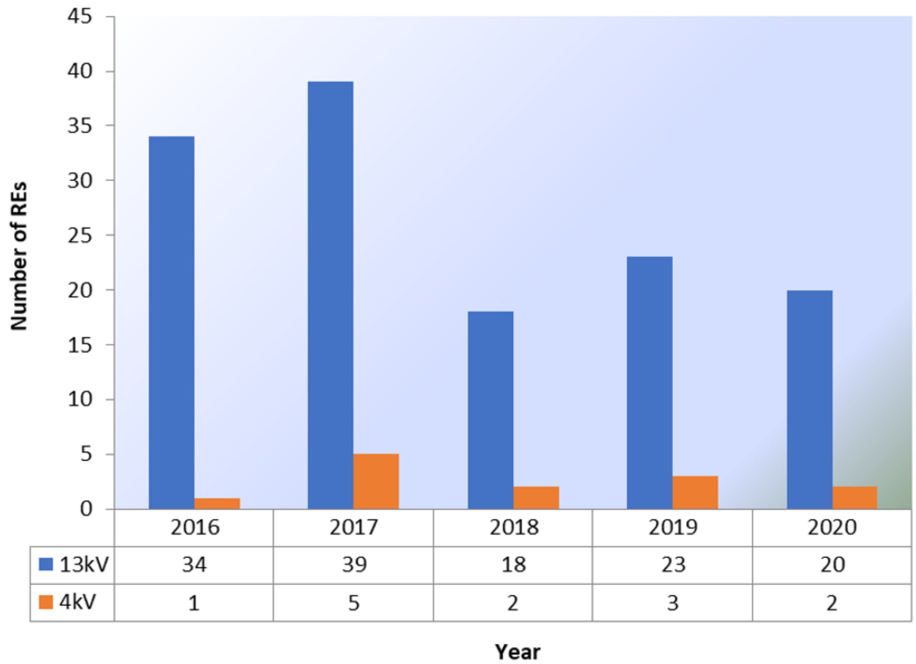
EPR	1	3	5	3	5	1	0	7	4	2
Other	0	2	1	0	3	3	0	0	0	0

Year

The majority of reportable events involving primary equipment occur on 13 kV feeders (Figure 3.17). 4 kV is a vintage technology and the majority of Pepco's underground system is 13 kV.

Figure 3.17: Voltage Class of Primary REs (2016-2020)



In addition, moisture plays a major role in the deterioration of both primary and secondary cable insulation. When a significant amount of precipitation occurs in the District, moisture and contaminants from the street, such as motor oil, lawn chemicals, etc., enter into the manholes and affect cable insulation. Additionally, snow/ice melt chemicals ingress after a storm can also penetrate cable insulation and lead to failure. While moisture affects all cable insulation, since secondary cable is not as robust or of the same design as primary cable, secondary cable is inherently more likely to fail under adverse weather conditions. A comparison of Figures 3.18 and 3.19 suggests that total moisture accumulation affects the number of reportable events.

The Failure Analysis Section will show failure analysis for all manhole incidents in the District in order to determine trends and remediation activities.

Slotted Manhole Covers [71]

New Slotted Manhole Cover Program Locations

In its 2013 Consolidated Report, Pepco discussed its criteria for selecting areas for installation of slotted manhole covers. This included areas with high load growth and potential business development. There were no slotted covers installed in 2020.

Historical Slotted Manhole Cover Program[72]

Pepco installed grated manhole covers over single and three-phase transformer installations, and network transformer installations in roadways and sidewalks. Their purpose is to assist in the dissipation of heat from the transformers. To explore the potential of an expanded application of vented manhole covers to non-transformer locations, Pepco contracted the Electric Power Research Institute (EPRI) to simulate manhole explosions. The simulations were specifically designed to test the effectiveness of solid, slotted and grated manhole covers in minimizing displacement of covers under fault conditions. The test data showed that the installation of slotted covers minimizes the frequency and impact of manhole events in three main ways:

- Energy released may escape through the slotted cover without lifting or displacing it;
- Smoke can provide an early warning of cable faults, thus preventing more serious events from occurring; or
- Explosions or fires may be avoided by the dissipation of combustible gases.

Based on these findings, Pepco installed custom-designed, slotted manhole covers in high volume pedestrian traffic areas of the District of Columbia where the low voltage alternating current network exists. The installation of slotted manhole covers has enhanced public safety while minimizing potential damage to underground electric facilities. The installation program was concluded in 2004 with an overall total of 7,880 slotted manhole covers having been installed.

[71] Order No. 16975 states the following at paragraphs 74 and 111:
85. Decision: …We agree with the Staff that a manhole replacement program that concluded in 2004 may no longer be appropriate, given business development in new areas of the District. We therefore require Pepco to reexamine the criteria used to select locations for the installation of slotted manhole covers and to report on this reexamination in the 2013 Consolidated Report.
114.Pepco is DIRECTED to revisit criteria used to select locations for installing slotted manhole covers consistent with paragraph 74 herein;
[72] In Order No. 16091 issued on December 10, 2010, the Commission stated among other things, at paragraph 59, the following:
59. … (4) include trend analysis for "Use of Slotted Manhole Covers;"

In Order No. 14093, the Commission approved Pepco's proposal to suspend further slotted manhole installations provided the Company submit an analysis of manhole events and failure rates associated with slotted covers, including recommended actions for 2008 by October 27, 2007, and continue to monitor debris accumulation in manholes with slotted covers. Pepco filed its analysis on August 21, 2007.

Pepco realizes that the openings in the covers, while allowing gases to vent, also allow rain, snow, dirt, debris and chemicals into manholes. As a result, Pepco continues to monitor debris accumulation in manholes with slotted covers. Of the 22 reportable manhole events that occurred in the District of Columbia in 2020, 2 involved manholes fitted with slotted covers.

Over the five-year period from 2016 through 2020, there were 231 reportable manhole events. Of these, 66 (29%) occurred in manholes with slotted covers. See Figure 3.20.

Figure 3.20: Manhole Events Involving Slotted Covers

	2016	2017	2018	2019	2020
All Events	67	44	55	43	22
# Events Slotted Covers	20	15	20	9	2
% Slotted	30%	34%	36%	21%	9%

Year

The rate of manhole events on these slotted covers is disproportional to the total population of these covers on the system. Currently there are slotted covers deployed on about 13% of manholes within the Pepco system yet we are consistently seeing slotted covers account for upwards of 29% of the total manhole events each year. This coupled with the fact that the current Pepco designed slotted covers are not 100% ADA compliant has led Pepco to reconsider the design for vented manhole covers.

With the support of EPRI, an Exelon utility peer group was formed to research manhole events and mitigation techniques. As a result of this research group, all Exelon utilities have aligned on a new design for vented manhole covers. These new manhole covers use a 3% vented design as compared to the current 23% slotted cover. Additionally, the new manhole cover design is fully ADA compliant.

Cable Splice or Joint Records[73]

Quality of workmanship is also being monitored as part of Pepco's program to reduce underground failures. Pepco repair crews complete a "Splice Manifest" report which records, among other things, the location, date, type of splice, the splicer's name and the foreman's name. Table 3.6 contains information from the "Splice Manifest" report for 2020 maintenance work performed. The splicer and foreman names have been redacted from the table.

Table 3.3: 2020 Splice Data (District of Columbia)

v

Appendix 3A: 2020 Manhole Events[74]

New Manhole Event Information

At the December 13, 2011 and February 16, 2012 PIWG meetings, it was decided that the following types of additional information related to manhole events would be included in future Consolidated Reports. The following categories of information have been included in this year's Consolidated Report.

- Incident Date
- Work Order/Request #
- Address
- Grid Number

[74] In Order No. 11716 ordering paragraph 3, the Commission ordered the following:

3. *PEPCO shall file an annual report on the previous calendar year's manhole incidents;*

Order No. 16975 states the following at paragraphs 72 and 110:

72. Decision: We accept the Staff's recommendation and require Pepco to include grid numbers and Siemens' inspection dates on manhole event reports. Each year over 200 manholes are selected through stratified sampling criteria and inspected by Siemens. Including grid numbers and inspection dates will help to identify manhole events traced to the manholes recently inspected, manholes located along Pepco's Priority Feeders, and manholes with and adjacent to recent manhole events. This will enhance independent/third party validation and quality assurance of the manhole inspection program.

110.Pepco is DIRECTED to provide grid numbers consistent with paragraph 72 herein;

- Feeder Number
- Manhole cover type (solid, slotted, roadway, round, sidewalk)
- Manhole Condition (clean, water below cable, water above cable, debris above cable)
- Voltage class (600V, 4kV, 13kV, 34kV, 69kV)
- Type of equipment (transformer, protector, cable, switch, straight joint, branch joint, trifurcating joint, transition joint, other)
- Equipment description: details specifics of the equipment such as size, insulation, phases, type of joint
- Repair description: details repair work
- A description of the failure mode (not previously recorded)
- A determination if the failure is a repeating event at this location (not previously recorded)

Pepco undertook a substantial database conversion during 2012 to make these additions to enhance summary reporting and analysis. The duration of the repair effort, which was outstanding in the database conversion effort as of the 2013 Consolidated Report, is now included within the database.

The listing of 2020 Manhole Events is provided in the following table:

Table 3A-1

2020 MANHOLE EVENT REPORT - DISTRICT OF COLUMBIA

As of : 4/5/21

EVENT No.	DATE	LOCATION	WARD	Quad	FDR	EVENT TYPE	Failure Type	Prim/Sec	Cable Size	Insulation	MANHOLE COVER	MH Size	DESCRIPTION/CAUSE	ACTION
DC20-01	2/6/2020	22nd & L St, NW	2	NW	14422	Smoke	Secondary Cable	Secondary	250 KCM	RN	Slotted	28'x28'	Burning 250 secondaries in duct line	cut cables in hole before and after to isolate. Pulled in new cable to make permanent repairs

Appendix 3B: 2020 Manhole Inspection Program[75]

[75] In Order No. 11716, the Commission stated the following:

PEPCO is hereby directed to include the following information in its [manhole inspection] reports beginning in July 2000:

1. *The general location of the manholes inspected, including the street or streets where the manholes are located and the blocks bounding the street, e.g., M Street, NW, between 23rd and 28th streets;*
2. *The number of manholes inspected in the month, broken down as to the number of manholes containing primary cables only, both primary and secondary cables, and secondary cables only;*
3. *The number of primary cable problems found;*
4. *The number of secondary cable problems found;*
5. *The type of cable problems found in each manhole, categorized as to the physical degradation or damage of the cable, overheating, overloading, damaged splice and deteriorated cable or splice due to age;*
6. *The number of manholes with problems;*
7. *The corrective actions taken for each cable and manhole problem found; and*
8. *Other general condition of the manhole such as whether it contained water, oil, grease, debris, and whether the manhole cover and the manhole are in good mechanical condition.*

APPENDIX 3B - MANHOLE INSPECTION PROGRAM (MIP)

Pepco began development of its manhole inspection program in 1999. By the end of 2006, Pepco had performed a total of 79,295 inspections, completing Phase I. Phase II of the Company's Manhole Inspection Program began in 2007 and was completed in the first quarter of 2013 with a total of 69,670 inspections. Phase III of the Company's Manhole Inspection Program began in 2013 and was completed in 2018 with a total of 66,836 inspections. Phase IV of the manhole inspection program is currently underway. A total of 10,614 manholes were inspected in 2020

Manhole inspections represent a significant undertaking that involve the visual assessment of the underground manholes and vaults and the equipment contained in them, taking load readings of low voltage cables and reviewing the integrity of cable splices. Supervisory personnel review records and corrective actions are identified and tracked. Data obtained during the inspections can be used to ascertain whether the secondary cables are overloaded or are likely to be overloaded under peak load conditions using appropriate de-rating factors and factors to simulate peak conditions. Inspections are also designed to identify load variations between phases which could indicate possible imbalanced conditions. By identifying such instances and taking appropriate actions, Pepco will continue to improve and maintain the reliability of its system.

Inspection Priority Definitions

As a result of the merger, new procedures and processes are in place across the Pepco region for planning and prioritizing corrective maintenance activities. Beginning in 2019, Pepco has adopted the Exelon work screening and prioritization practices in the manhole inspection program. All corrective maintenance reportable conditions (CMs) are classified into one of four categories under the Exelon model: P10, P20, P30, or P40. A description of each deficiency is shown below:

<u>P10:</u> Immediate response required; work item until complete or until corrective actions allow the downgrading of the priority. Priority 10 CMs should not exceed 3 days. These items have a direct and immediate impact to safety, SAIFI, or SAIDI.

P20: Priority 20 CMs are usually completed within 14 days and should not exceed 30 days. corrective plans shall be created for Priority 20 CMs that exceed 30 days. These items have a high probability of affecting SAIFI, SAIDI, or safety.

P30: Priority 30 CMs are typically completed within 9 months and should absolutely not exceed 1 year. A corrective plan shall be created for priority 30 CMs that exceed 1 year. These items have a moderate probability of affecting SAIFI or CAIDI if not addressed within a year's timeframe. For priority 30 CMs that require completion before the 9-month target, an agreed upon need date shall be established through the work screening process. All changes in proposed need date require approval.

P40: Work not meeting the criteria for a P10, P20, or P30 shall be considered a P40 and completed not to exceed the predominant maintenance cycle interval. Impact on SAIFI or CAIDI would only result if the condition rapidly degrades. A priority 40 CM shall not exceed 1 year past the determined preventative maintenance cycle for the associated equipment class.

Current Program Status

During 2020, the MIP has identified the following remediation Priorities:

	Priorities Count	Percentage of CY 2020 Priorities
Priority Code 10	88	3%
Priority Code 20	16	1%
Priority Code 30	18	1%
Priority Code 40	3157	96%

Inspectors are conducting more comprehensive and thorough inspections which have resulted in a substantial increase in Priorities found. In 2020, approximately 31% of the manholes inspected revealed potential areas of concern that have been or are in the process of being addressed. Figure

3.2-B1 provides a graphical representation of the number of manholes and the percentage of overall inspections with priority conditions.

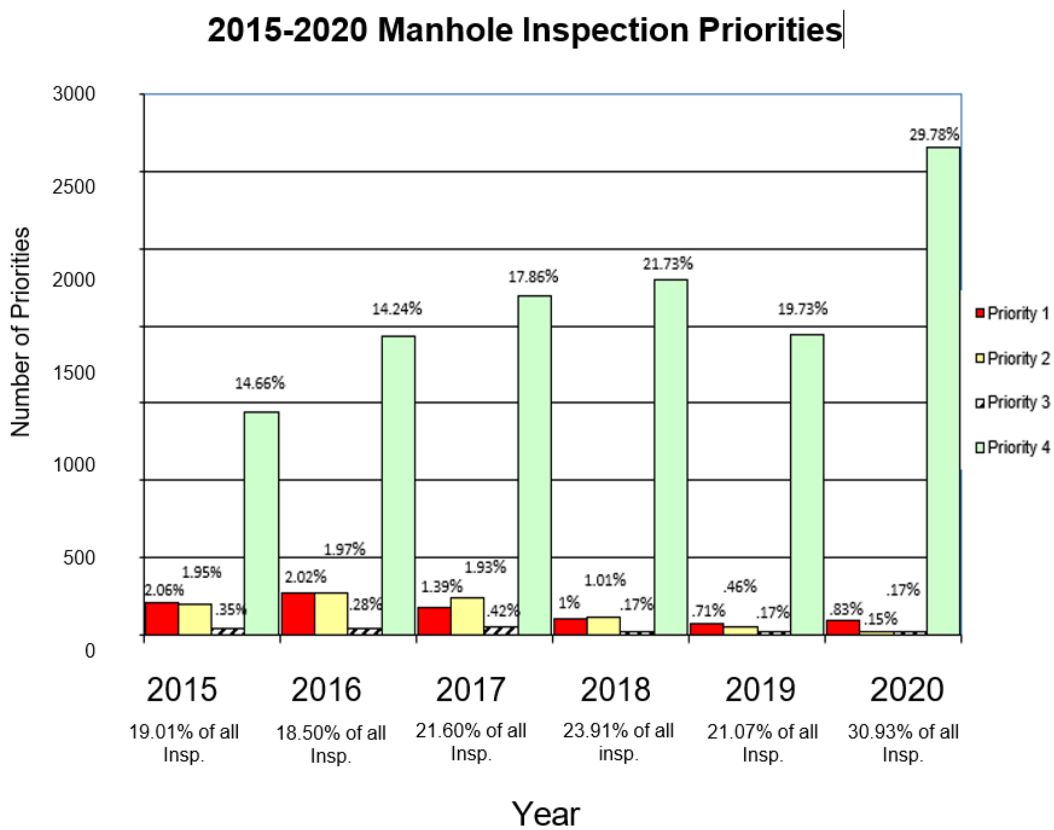

Figure 3.2-B1: Manhole Inspection Priorities – Phase IV

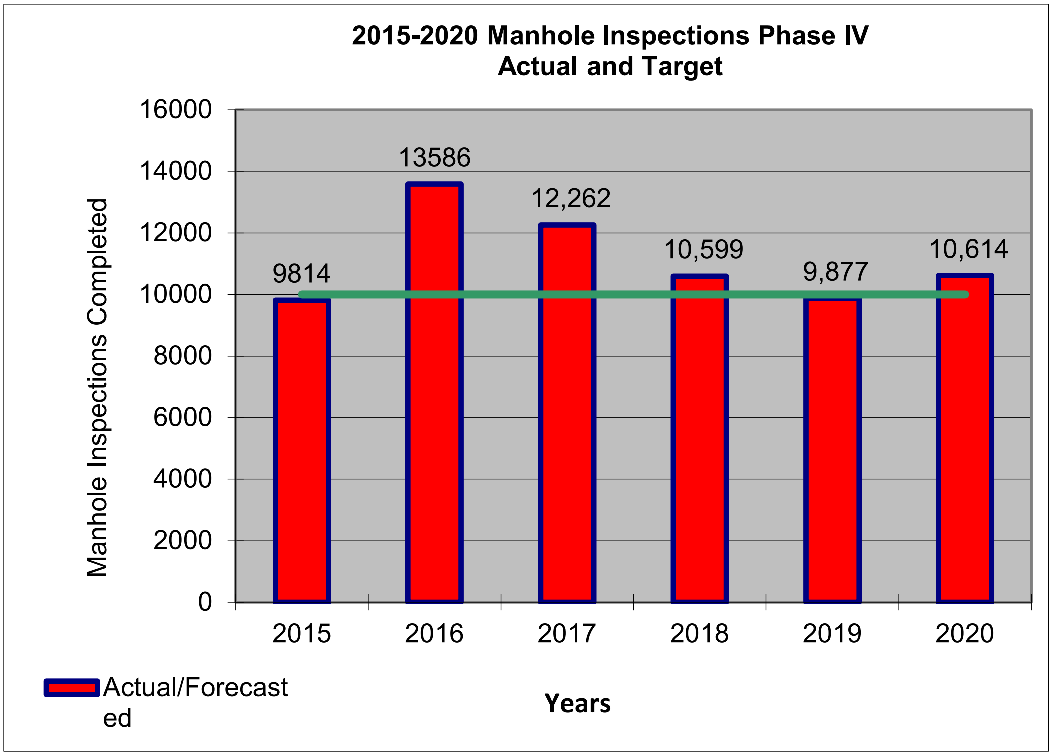
With the implementation of the Manhole Inspection Quality Control (QC) Program, inspection Priorities have increased from 1,866 in 2015 to 3,279 Priorities in 2020. The majority of the increase is related to Priority 40 conditions, which are not considered an imminent risk and must be remediated within 12 months and the increase can be attributed at least in part to more rigorous inspections.

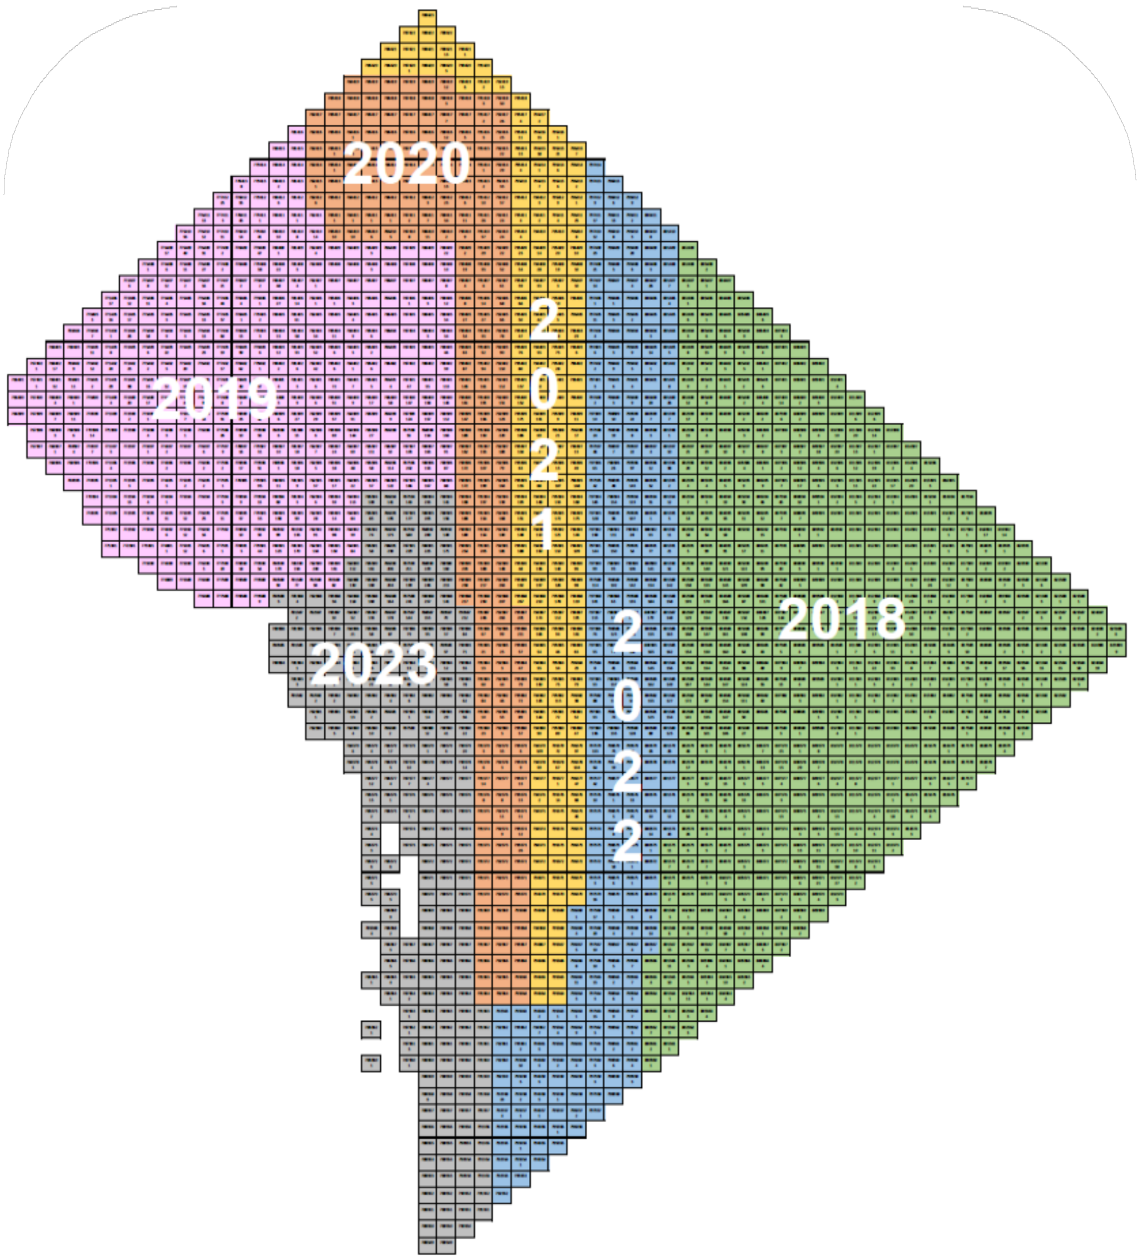
Figure 3.2-B2: Manhole Inspections Completed – Phase IV



In 2017, a comprehensive analysis on the manhole population in the District was performed using GIS extracts. Using these records, a more efficient inspection plan was created for the next complete cycle in the District. Additionally, the tracking mechanism for manhole inspections was changed for inspections occurring in 2018 and forward. Previously, inspections were assigned on a 1,000' x 1,000' "plat" basis rather than by individual manholes. This left room for gaps and a small number of missing inspections. Moving forward, all manhole inspections will be tracked on an individual manhole level, leaving no room for errors or missing inspections.

With the new GIS extract that was performed, a grouping of manholes based on geographic location was performed in order to solidify the inspection plan for the next 6 years. Figure 3.3 below shows the manhole inspection map of the District for years 2018-2023. Each colored region has an equivalent number of manholes within it, equally divided between 6 inspection years. This plan will improve the crew efficiency and future corrective maintenance work planning as crews won't be moving all across the city for one year.

Figure 3.2- B3: 2018-2023 Manhole Inspection Plan



Quality Control Program

The manhole inspection program QA/QC process is broken into three parts that is to be followed by Aldridge Electric:

- Office Review: A minimum of 15% of the inspected locations are to be reviewed in office after the inspections are complete and the information is uploaded into the manhole inspection database. This review process consists of the following:
  - Review photos to ensure quality of 360 and Still shots labeled accurately
  - Verify if manhole cleaning is required based off photos
  - Verify Output of assessment pdf is accurately filled out
  - Verify CM work
  - Verify all manhole locations deemed out of scope or missing.
- Field Inspection Review: A minimum of 8% of the inspected location are reviewed which include a review of inspectors' work (setup, assessment, safety, etc.) on site at the time of inspection, by the field leadership team.
  - 2 AE Foreman training and performing quality inspections full time
  - 1 AE General Foreman providing oversite and quality inspections when available
  - 1 AE Construction Manager overseeing subcontractor full time
- Field CM Review Process: A minimum of 7% of the inspected locations are reviewed by Foreman and PM daily with 360 completion photos to verify accuracy of work performed. A completion log is filled out by crew leader for every manhole worked.
  - 1 AE Foreman performing quality inspections full time
  - 1 AE General Foreman providing oversite and quality inspections when available
  - Verify installed items vs. called out items in assessment
  - Field Lead identifies all CM work is complete
  - Verify 360 photo taken upon completion
  - Crew leader reviewing original assessment to verify accuracy at every location visited

Appendix 3C: Network Accuracy Procedure Report[76]

[76] In Order No. 16709 paragraphs 9 and 10, the Commission ordered the following:

9. *The Commission is satisfied that Pepco has developed a reasonable plan to ensure that its underground cables are adequately sized for existing and future loads. However, we do want to monitor Pepco's diligence in performance and the results of implementation of its network modeling, GIS updates, and timely network technology improvements going forward. We, therefore, direct the Company to file periodic reports to keep the Commission and interested parties apprised of the status of several ongoing projects as follows:*
   a. *Pepco is directed to provide a detailed status report on those eight networks that are currently undergoing analysis under the Company's Network Accuracy Procedure including the corrective actions that were identified by December 2011. This report on the eight networks should be added to the Company's 2012 Consolidated Report or filed as a Supplement to the 2012 Consolidated Report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report; and*
   b. *Pepco is directed to file a detailed status report on the results of its modeling and analysis and the implementation of its remedial actions on all of its remaining networks under its Network Accuracy Procedure. This report on the remaining networks should also be added to the 2012 Consolidated Report (or filed as a Supplement to the 2012 report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report) with updates in each subsequent year's report. The status report on those remaining networks shall include corrective actions that have been scheduled and those that have been completed.*

THEREFORE, IT IS ORDERED THAT:

10. *Pepco shall comply with the directives set forth in paragraph 9 herein.*

Network Accuracy Procedure Report

Status Report of the Analysis of the Remaining District of Columbia Networks, in Accordance with the Network Accuracy Procedure.

As reported in 2020, all investigations of Pepco's LVAC networks in the District of Columbia have been completed. Pepco has adopted the network accuracy procedure and intends to continue reviewing the accuracy of the LVAC networks; however, Pepco will not report further on this procedure's results in the ACR.

SECTION 4.2 – TECHNICAL TERMS AND DIAGRAMS

This section contains definitions, explanations and diagrams used in discussing electric system operations, design characteristics, and performance.

Alternating Current (AC)

A current, which reverses at regularly recurring intervals of time and that has alternately positive and negative values.

Ampere

The "ampere" is the basic unit of current equal to the flow of one coulomb of charge passing a point in one second. It is also the amount of current that is allowed to flow when a difference of potential of one volt is applied to a resistance of one ohm.

Ampere-hour

The flow of current per hour. Ten ampere-hours is equal to the flow of 10 amperes for a period of one hour or the flow of one ampere for ten hours.

Arrester

A device that provides an alternate path for surge currents caused by over-voltage resulting from lightning or switching surges.

Battery

Two or more cells electrically connected for producing electric energy. A device that transforms chemical energy into electric energy.

Cable Joint

A connection between two or more separate lengths of cable with the conductors in one length connected individually to conductors in other lengths and with the protecting sheaths so connected as to extend protection over the joint.

Cable Rack

A device usually secured to the wall of a manhole, cable raceway, or building to provide support for cables.

Cable Splice

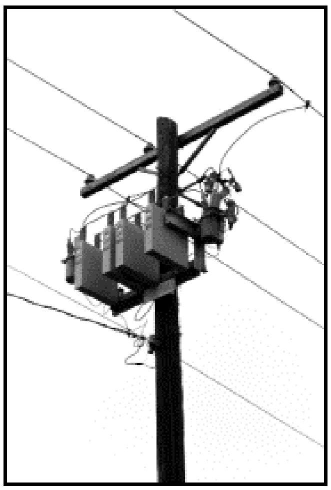
See Cable Joint

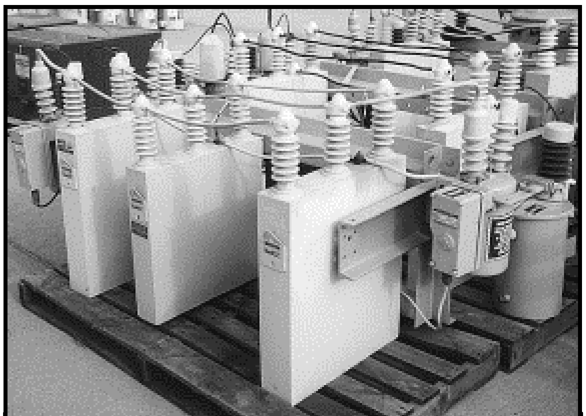
CAIDI (Customer Average Interruption Duration Index)

Represents the average time required to restore service to the average customer per sustained interruption. Mathematically equal to SAIDI divided by SAIFI.

Capacitor

An electrical device for storing a charge of electricity and returning it to the line. It is used to balance the inductance of a circuit, since its action is opposite in phase to that of inductive apparatus; it throws the current ahead of the electromotive force in phase. It is made of alternate plates of tinfoil and insulating material. The size of plates and the thickness of insulating material determine the capacity for holding electric charge. Capacity is measured, practically, in micro-farads, millionths of a farad.





Capacitors

Circuit

A conductor or system of conductors through which an electric current is intended to flow.

Circuit Breaker

A device designed to open and close a circuit by non-automatic overload of current without damage to itself when properly applied within its rating.

Conductor

A material that allows the flow of electricity; a metal wire, in the center of an electrical cable, through which current flows.

Conduit

A pipe, most often made of polyvinyl chloride, used for the installation of cables underground.

CPI (Composite Performance Index)

A distribution feeder performance measuring index created by combining 4 industry standard reliability indicators. The indicators used in CPI are Number of Interruptions (NI), Number of Customer Hours of Interruption (CHI), System Average Interruption Frequency (SAIF) and System Average Interruption Duration (SAID).

Cycle

One complete set of positive and negative values of an alternating current.

Duct

A single enclosed runway for conductors or cables.

Duct Bank

An arrangement of conduit providing one or more continuous ducts between two points.

Efficiency

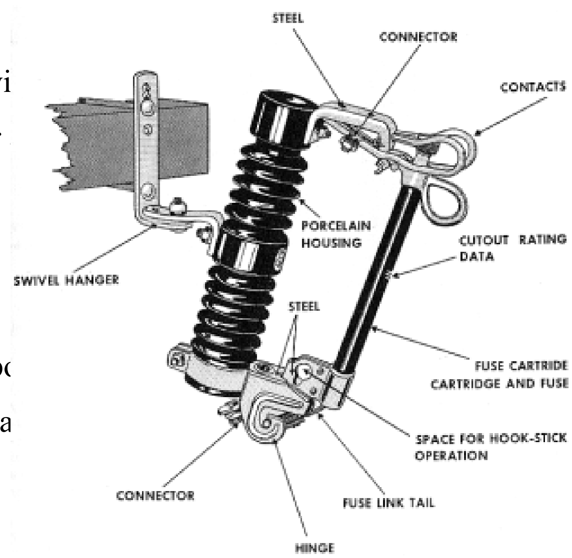
The ratio of the useful output to the input of energy, power, quantity of electricity, etc.

Fault Current

A current that flows from one conductor to ground or to another conductor owing to an abnormal connection (including an arc) between the two. Note: A fault current flowing to ground may be called a ground fault current.

Fuse

An electrical safety device consisting of, or including, a wi
interrupts the circuit when the current exceeds a particular



Fuse Cutout

A device that is used to de-energize and re- energize compo
protects the line and components from the effect of overloa

Fuse Element

The part of a fuse that melts and interrupts the circuit when excessive current flow occurs.

Ground

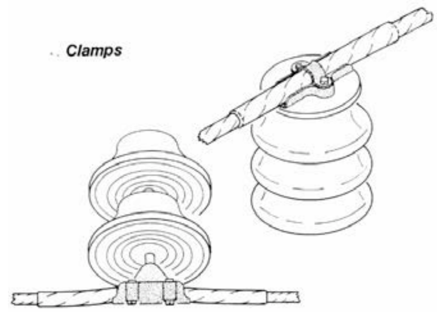
A conducting connection, whether intentional or accidental, by which an electric circuit or equipment is connected to the earth or to some conducting body that serves in place of the earth.

Inductance

The process that produces a voltage due to interaction of a conductor, a magnetic field, and relative motion between them.

Insulator

A material that offers a great deal of resistance to electron flow.



Kilowatt-Ampere (kVA)

The unit of apparent power in alternating current circuits as distinguished from kilowatts which represent true power.

Kilowatt (kW)

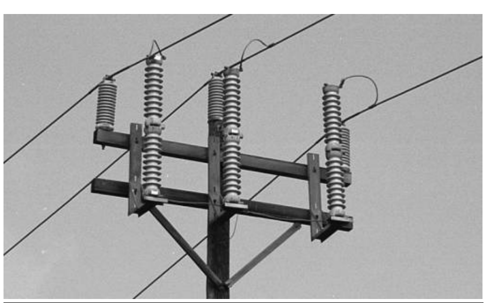
A unit of electric power equal to one thousand watts.

Kilowatt-hour (kWh)

The work performed by one kilowatt of electric power during one hour.

Lightning Arrester

A device that has the property of reducing the voltage of a surge applied to its terminals by the surge current to ground. It is capable of interrupting follow current if present and restores itself to original operating conditions.



Load Factor

The ratio of the average load over a designated period of time to the peak load occurring in that period.

Low Voltage (LV)

600 volts and lower.

Manhole

A subsurface chamber, large enough for a man to enter, in the route of one or more conduit runs and affording facilities for placing and maintaining in the runs, conductors, cables, and any associated apparatus.

Megawatt (MW)

One million watts.

Network

An aggregation of interconnected conductors consisting of feeders, mains, and services.

Overload

A load greater than the rated load of an electrical device.

Paper-Insulated Lead Cable (PILC)

A primary cable designed with paper insulation wrapped around a shielded conductor and covered with a flexible lead covering.

Phase

The relative time of change in values of current or electromotive force. Values that change exactly together are in phase. Difference in phases is expressed in degrees, a complete cycle or double reversal being taken as 360 deg. A 180-deg phase difference is complete opposition in phase.

Polychlorinated Biphenyls (PCB)

A toxic environmental contaminant requiring special handling and disposal in accordance with US Environmental Protection Agency Regulations. No longer used in transformers.

Pothead

A device used to protect the connection between a URD and an overhead system. A pothead also provides a termination for the URD cable insulation.

Power

The rate of doing work or the rate of expending energy. The unit of electrical power is the watt. Power is calculated by multiplying current time voltage.

Power Factor (pf)

The ratio of the actual power of an alternating current as measured by a wattmeter, to the apparent power, as indicated by ammeter and voltmeter reading. The power factor of an inductor, capacitor or insulator is an expression of their losses. The ratio of total watts to the total root-mean-square (RMS) volt-amperes. It is a mathematical term whose value is less than or equal to unity, or one. This term is used to show the relationship between volt-amperes (which is the basis for rating transformers, generators, etc.) and watts which is the measure of usable power delivered. A low power factor results in a lower usable power delivery or consumption for a given value of electric current than would result with a high power factor. The result of a low power factor is higher losses through the wires, cables, and other electrical apparatus.

$$pf = \frac{\sum Watts}{\sum RMS\ VoltsxAmperes}$$

Preassembled Aerial Cable (PAC)

Preassembled Aerial Cable (PAC) is an installation of three single underground cables triplexed together and installed on the overhead distribution system in heavily wooded areas. Each of the three conductors is a fully insulated cable grouped together in a package that is supported by a metallic messenger. The installation is more robust than tree wire and has the ability to withstand falling tree limbs.

Primary Circuit

The higher voltage circuit in a URD system that carries power to the transformers.

Protective Relay

A relay whose function is to detect conditions of an abnormal or dangerous nature and to initiate appropriate control circuit action.

Reactive Power

The product of voltage and the out-of-phase component of alternating current generally measured in kilovars (kVAR). Reactive power decreases the substation's ability to deliver real power and increases system losses.

Reactor

A device, the primary purpose of which is to introduce reactance into a circuit.

230 kV Reactor

Real Power

The rate, generally measured in kilowatts (kW), of generating, transferring, or using energy. The power which serves the customers' end-use electrical devices and the power for which the customer is metered.

Relay

An electric device that is designed to interpret input conditions in a prescribed manner and, after specified conditions are met, to respond to cause contact operation or similar abrupt change in associated electric control circuits.

Remote Terminal Unit (RTU)

A device that controls substation equipment.

SAIDI (System Average Interruption Duration Index)

Average time customers are interrupted. Mathematically equal to the sum of Customer Interruption Hours divided by Total Number of Customers Served.

SAIFI (System Average Interruption Frequency Index)

Average frequency of sustained interruptions per customer. Mathematically equal to the sum of Number of Customer Interruptions divided by Total Number of Customers Served.

SCADA (Supervisory Control and Data Acquisition) System

A system that allows dispatchers to monitor and control substation equipment from a central location; also provides documentation for record keeping.

Secondary

Referring to the energy output side of transformers or the conditions (voltages) usually encountered at this location.

Short-Circuit

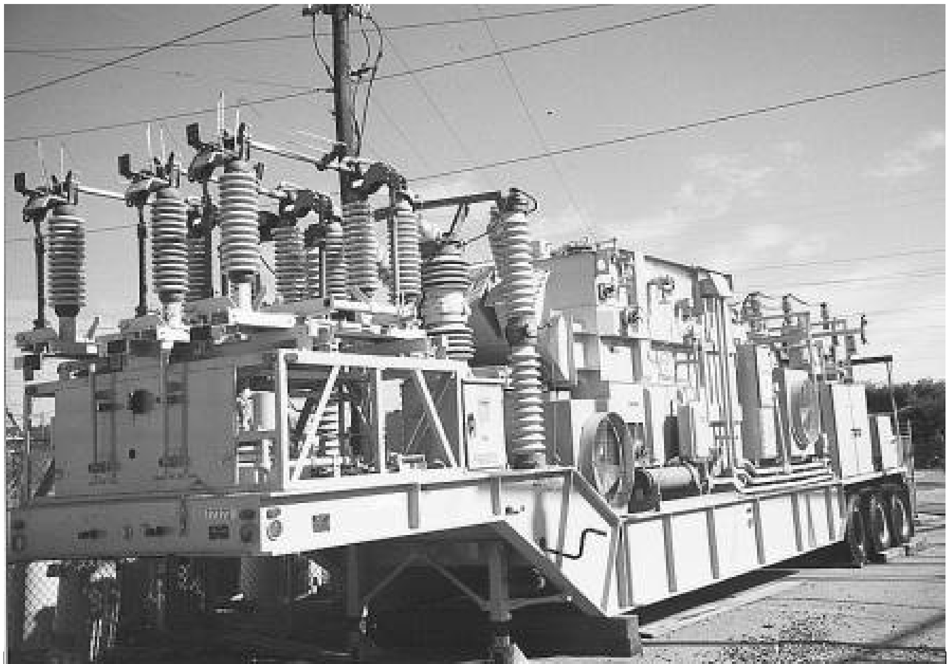
An abnormal connection of relatively low resistance, whether made accidentally or intentionally, between two points of different potential in a circuit.

Splice

A joint used for connecting in series, two lengths of conductor or cable.

Substation

An assemblage of equipment for purposes other than generation or utilization, through which electric energy in bulk is passed for the purpose of switching or modifying its characteristics. Note: A substation is of such size or complexity that it incorporates one or more buses, a multiplicity of circuit breakers, and usually is either the sole receiving point of commonly more than one supply circuit, or it sectionalizes the transmission circuits passing through it by means of circuit breakers.



Mobile Substation

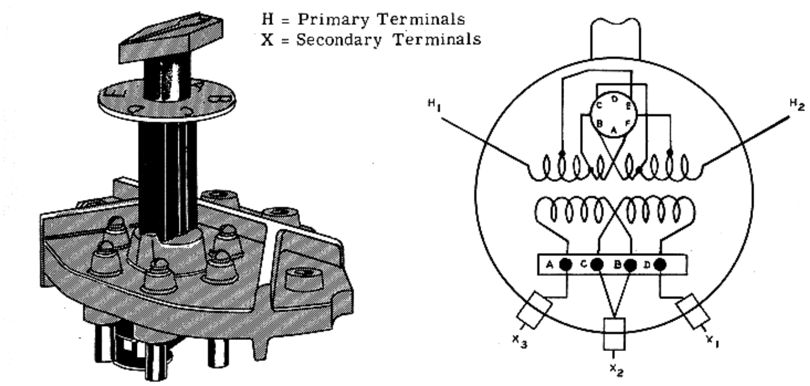
Switchgear

A general term covering switching and interrupting devices and their combination with associated control, metering, protective, and regulating devices, also assemblies of these devices with associated interconnections, accessories, enclosures, and supporting structures, used primarily in connection with the generating, transmission, distribution and conversion of electric power.

Tap

Connections that allow a transformer's turns ratio to be adjusted by adding turns to or subtracting turns from the transformer's primary or secondary winding. A connection brought out of a winding at some point between its extremities to permit changing the voltage or current ratio (general). An intermediate point in an electric circuit where a connection may be made.

A Tap Changer is Used to Adjust the Turns Ratio of a Transformer



No Load Tap Changer

Typical Internal Wiring of Transformer with Tap Changer

Tap Changer

A device for changing the turns ratio of a transformer.

Telemetering

Transmission of intelligence such as meter readings over a long distance, usually from stations to the dispatcher's office, by direct wire or carrier current.

Three-Phase Circuit

A combination of circuits energized by alternating voltages that differ in phase by one-third, that is, 120 degrees.

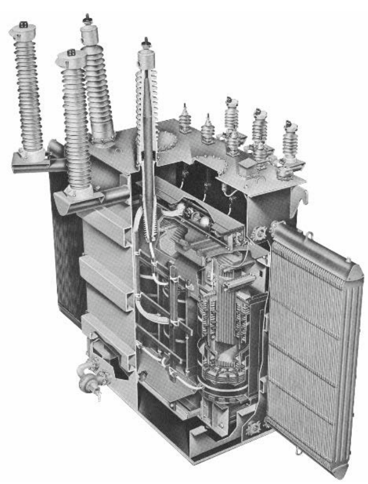
Three-Wire System

A system of electric supply comprising three conductors, one of which, known as the neutral wire, is maintained at a potential midway between the potential of the other two, referred to as the outer conductors. There are two distinct voltages of supply, one being twice the other.

Transformer

A component used to change AC voltage to meet specific requirements. A device consisting of a winding with tap or taps, or two or

more coupled windings, with or without a magnetic core, for introducing mutual coupling between electric circuits.



Transmission Line

A line used for electric-power transmission.

URD System

A local distribution system designed primarily to be buried in the ground and to serve residential customers.

VAR

Reactive volt-amperes.

Volt

Unit of measure for voltage. One volt is defined as the voltage necessary to drive a current of one ampere through a resistance of one ohm.

Voltage

Electric potential or potential difference expressed in volts.

Watt

Unit of measure for electric power, equal to the amount of power produced when one volt causes one ampere of current to flow.

Watt-hour

Basic unit used to measure electrical energy. Watt-hours are determined by multiplying power by time. One watt-hour is the amount of energy used when one watt of power is delivered to an electrical device for one hour.

SECTION 4.3 – SELECTED COMMISSION ORDERS

COMPREHENSIVE PLAN

System Planning

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. The Commission requested that the Company provide a Comprehensive Plan detailing proposed changes to the electric system for the purposes of meeting load growth or maintaining system reliability. On pages 143-144 of the hearing transcript, Pepco's witness Mr. Gausman explained the nature of the Company's existing plans for the distribution and transmission systems:

We have plans for each of our substations in D.C., and in each of those plans we address the needs for that location, what the growth forecast is, what type of construction is going to be needed for expansion in the distribution system in each of those locations… Now when you go up to the transmission level or the substation supply level, there you have a plan that is addressing a larger area of the town because you're looking at the whole capacity of the system.

The Company expanded its responses to the Commission's requests in the first filed Comprehensive Plan. Since that date, the Company's Comprehensive Plans have been expanded based on several Commission directives. The report that follows either expands upon the discussion in the initial hearings requesting the Consolidated Report or responds to subsequent Commission directives as cited below.

The following section of the report addresses system plans based on forecasted load growth.

In Order No. 12804 paragraph 53 B, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report;

Load Forecasting

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, the following topics were discussed, as cited on pages 141-144 of the hearing transcript:

Comprehensive long-term planning on the underground system

Pepco's 10-year construction plans

Distribution load growth forecasts by substation

Transmission/substation supply load growth forecasts

In order No. 12735 issued on May 16, 2003 the Commission stated at paragraph 139, the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

Customer growth projections by District of Columbia wards (including historical comparisons);

Load growth projections encompassing commercial and residential development by District of Columbia wards (including historical comparisons);

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

In Order No. 12804 paragraph 53, the Commission stated the following:

The 2003 PIP is hereby APPROVED, provided that PEPCO:

Provide the projected zonal and projected default (i.e., SOS) load data for the District of Columbia to the PIWG on a quarterly basis as well as in the 2004 and subsequent PIPs;…

Power Factors

In Order No. 10133, the Commission directed Pepco to include performance factors relating to the transmission and distribution (T&D) system in future PIPs.

"PEPCO…was directed to…provide in future PIP reports forecasts of plant performance factors which are based on analyses of both the projected performance and the prior year's actual performance"(page 10, Section B).

"…the Commission finds it entirely appropriate to include performance measures for PEPCO's transmission and distribution in the mix of issues examined by the PIWG and reported in the PIP"(page 12, third paragraph).

By way of compliance with the above requirements, in the September 1993 PIWG Meeting, Pepco proposed reporting performance data on its 13 kV distribution substation power factors.

Substation

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (page 266 of the hearing transcript):

But what we were talking about here yesterday was that the comprehensive plan would include… any rebuilt substations you might have; any new substations you might have…

Distribution

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (pages 266-267 of the hearing transcript):

But what we were talking about here yesterday was that the comprehensive plan would include… anything that you might envision to account for distribution load growth…

In Order No. 12735 issued on May 16, 2003, the Commission stated the following at paragraphs 74 and 135:

74. During the November 2001 hearings the Commission requested that PEPCO submit a comprehensive plan to include a current assessment of, and future plans for, its underground distribution and network facilities.[179] *The Commission requested the plan as a tool to evaluate PEPCO's planning methodology and to assess PEPCO's ability to anticipate and respond to changing conditions in its underground distribution system…*

135. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

(c) Listing of underground distribution projects, such as the Adams-Morgan neighborhood project (including budgets, time schedules, and expected benefits) by secondary vs. primary system by District of Columbia wards affected, but not specific locations;

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Technology

In Order No. 12804 paragraph 53 E, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

SCADA

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 313 of the hearing transcript, Commissioner Meyers stated the following:

We're going to ask Pepco to please include a section on reporting and monitoring in the comprehensive plan… And just as a quick for instance of this real-time systems control and data acquisition system, SCADA, what could it do? Give me a for instance there.

DA

In Order No. 12804 paragraph 53 E, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

OMS

In Order No. 13422 on the 2004 Consolidated Report, paragraph 66, the Commission stated the following:

The 2004 Consolidated Report: Productivity Improvement Plan and Comprehensive Plan is hereby APPROVED, provided that PEPCO:

Report in the 2005 Consolidated Report, due February 15, 2005, on the corrective actions taken to fix the OMS;…

CIS

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 503 of the hearing transcript, Commissioner Meyers stated the following:

You've been a leader in CADS all along, computer assisted data systems. There's some discussion here about various other types of reporting and monitoring systems…

Power Delivery Information Systems Projects

In Order No. 12735, paragraph 139, the Commission stated the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:…

Listing of power delivery information system projects with implementation schedules, annual costs, and milestones;

Listing of new technology investigations with decisions, annual costs, and implementation schedules;

…The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Equipment Standards

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 149 of the hearing transcript, Commissioner Meyers stated that the Comprehensive Plan should include:

…not only [the 10-year underground construction budget and 4 kV to 13 kV conversion], but… incorporating standards of what you want this to look like…

Equipment Inspections

In Order No. 16091, paragraphs 46 and 63, the Commission stated the following:

46. Decision. ... we shall require that Pepco provide a list of the types of equipment for which a "run to failure" method applies and those for which a preventive method applies. (Footnote: If other maintenance methods are used, Pepco shall describe them as well.) The Commission requires that Pepco provide an explanation of why different maintenance methods apply to *different types of equipment. We also require a description of the "test procedures" that Pepco uses to assess the performance and remaining life of the equipment. (Footnote: See Pepco comments at 7.) Further, Pepco shall provide an estimate of the current book value of equipment maintained under each method used by Pepco. The 2011 Consolidated Report shall include this description of maintenance policies and methods.*

63. Pepco IS DIRECTED to provide a description of its maintenance policies and methodologies, consistent with paragraph 46 of this Order;

Storm Readiness / ERIP

In Order No. 15152 at paragraph 71, the Commission ordered the following:

71. PEPCO is DIRECTED to prepare an action plan to reduce service restoration times and improve SAIDI and CAIDI performance, consistent with Order No. 14643 issued November 30, 2007 and herein, to be included in the 2009 Consolidated Report;

Order No. 15568 followed, requiring the following:

32. The Commission directs Pepco to report to each meeting of the PIWG on its Action Plan. That report should include a written description of the steps taken pursuant to the Plan. For example, in connection with the item that includes "Develop a process design and implement training," Pepco should describe the design and the training given to crews, including the number of employees who have availed themselves of the training. In addition, Pepco should be prepared to answer questions about the progress of the Action Plan from other members of the PIWG.

52. Pepco IS DIRECTED to report to each meeting of the PIWG on its Action Plan, consistent with Paragraph 32 of this Order;

Electricity Quality of Service Standards

Specific Consolidated Report requirements from the EQSS portion of the D.C.M.R. are listed below.

Progress on current corrective action plans [on customer calls answered] shall be included in the utility's annual Consolidated Report.

The utility shall report the actual call center performance during the reporting period in the annual Consolidated Report of the following year.

Progress on any current corrective action plans [on call abandonment rates] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.

Progress on any current corrective action plans [on new residential service installation requests] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3603.5 The utility shall report on the progress of the corrective action plan [on repeat least performing feeders] in the Annual Consolidated Report submitted to the Commission.

The utility shall report on the number and percentage of non-major service outages that extend beyond the twenty-four (24) hour standard and the reasons each such outage extended beyond the twenty-four (24) hour standard.

The report drafted pursuant to Section 3603.8 shall be included in the annual Consolidated Report on reliability data.

The utility shall report on the progress of the corrective action plan [on SAIFI, SAIDI and CAIDI benchmarks] in the annual Consolidated Report submitted to the Commission.

The utility shall also, per the orders of the Commission, continue current requirements of reporting annual reliability indices of SAIFI, SAIDI and CAIDI (with and without major events) in the annual Consolidated Report of the following year.

Industry Comparisons

In Order No. 15568 paragraph 57, the Commission ordered the following:

57. Pepco IS DIRECTED to provide a report on the Electric Utilities Best Practices, consistent with Paragraph 50 of this Order. This report shall be included in that 2010 Consolidated Report; and shall include the best practices of the electric utility industry on improving reliability and outage restoration (from the Benchmarking Studies). Pepco shall submit a continuous improvement plan, including resourcing, specific performance targets, and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparable) utilities in the Benchmarking Studies.

Implementation of Twenty Best Practices

In Order No. 16091 paragraph 61, the Commission stated the following:

61. Pepco IS DIRECTED to include a "2011 Best Practices Report" in its 2011 Consolidated Report describing its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program, consistent with Paragraph 22 of this Order;

22. Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568. Second, as to the Staff's Recommendation that Pepco file a "Best Practices Report" from the PA Consulting's 2009 Polaris Transmission and Distribution Benchmarking Program, we agree that a report may be helpful in assuring that best practices continue to be implemented. Therefore, the

Commission shall require that Pepco include in its 2011 Consolidated Report a section entitled "2011 Best Practices Report" in which Pepco shall describe its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program included in the 2010 Consolidated Report as Appendix 2D. The twenty best practices selected by Pepco should be those judged to have the most impact on reliability and outage restoration performance. Pepco shall report on all its activities during 2010 to implement these best practices, including data on staffing levels, expenses and results. This requirement is separate from the requirement to produce a "Continuous Improvement Plan," as is described more fully in Section IV.A.1.f.

PA Consulting Recommendations

In Order No. 15632 issued in these proceedings, the Commission states at paragraph 5 the following:

5. Pepco shall file with the Company's annual Consolidated Reports to the Commission data on the Company's measures to continue to address each of the recommendations made by PA Consulting and the effectiveness of the Company's approaches to improve CAIDI and SAIDI to at least the average of PA Consulting benchmarks. This obligation shall begin with the 2010 Consolidated Report.

In Order No. 15568 issued October 7, 2009 in these proceedings, the Commission states at paragraph 52 the following:

*52. Pepco IS **DIRECTED** to report to each meeting of the PIWG on its Action Plan, consistent with Paragraph 32 of this Order;*

32. The Commission directs Pepco to report to each meeting of the PIWG on its Action Plan. That report should include a written description of steps taken pursuant to the Plan. For example, in *connection with the item that includes "Develop a process design and implement training." Pepco should describe the design and the training given to the crews, including the number of employees who have availed themselves of the training. In addition, Pepco should be prepared to answer questions about the progress of the Action Plan from other members of the PIWG.*

In Order No. 16091 issued in these proceedings, the Commission states at paragraph 22 the following:

22. *Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568.*

PRODUCTIVITY IMPROVEMENT PLAN

Productivity Improvement Plan

In Order No. 15152 on the 2008 Consolidated Report, paragraph 68, the Commission ordered the following:

The Productivity Improvement Working Group, which includes OPC, provided a reasonable definition of a productivity improvement project in 2006. Specifically, the PIWG states:

T&D productivity improvement projects were considered those projects that will increase T&D system efficiency by reducing losses and improve[ing] system reliability, and which may defer more costly additions to the electric system. (Footnote: F.C. No. 766, Decision on Consideration of OPC's T&D Productivity Improvement Working Group in Response to Commission Order No. 13754, filed July 6, 2006 ("2006 PIWG Report"), at 2.)

The power serving the District's Standard Offer Service customers is now procured through a wholesale procurement process by PEPCO and, as such, productivity improvement is applicable only to transmission and distribution issues. We find the PIWG's definition of a productivity improvement project workable and adopt it here.

The PIWG also provided a reasonable definition of comparative cost analysis for reliability projects. The PIWG suggested that the comparative cost analysis used for reliability projects should "consist *of a comparison of the cost of alternative reliability improvement solutions as well as any differences in relative reliability improvement." (Footnote: 2006 PIWG Report at 2.) …*

Reliability Statistics

Page 190 of the transcript for the November 5-7, 2001 hearings documents Commissioner Cartagena as stating the following:

You testified earlier that you have a 10-year plan for updating the system or addressing whatever changes are required with regards to that. Does that 10-year plan contain reliability goals or other measurable performance objectives? In other words, are there some kinds of standards that we can look at and will give us an idea of whether the company is hitting or missing those standards and objectives with regards to its plan?

This section of the Consolidated Report addresses the Company's performance with respect to reliability standards and Electricity Quality of Service Standards.

Targeted Reliability Indices

In Order No. 12735, paragraph 139, the Commission ordered the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

Targeted reliability indices (including historical comparisons); and

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Also, in paragraph 142, the Commission directed the Company to file performance indices for the District of Columbia only.

PEPCO is DIRECTED to work with the PIWG to develop target system reliability indices for the District of Columbia, only.

Vegetation Management

In Order No. 15621 at paragraph 5, the Commission ordered the following:

5. Pepco shall file within the Company's annual Consolidated Reports to the Commission, yearly data on tree trimming by feeder and wards (or multiple wards) compared to the Company's *tree down and tree limb outage causes listed in its monthly power outage reports beginning with the Company's 2010 Consolidated Report.*

Priority Feeders & Aggressive Initiatives

The Electricity Quality of Service Standard D.C.M.R. 3603.6 states the following:

3603.6 The utility shall continue the current reporting of the worst performing (lowest two (2) percent) feeders (utility methodology) and corresponding corrective action plans, with the action taken in year 1 and the subsequent performance in year 2 in the annual Consolidated Report.

In Order No. 15152 paragraph 73, the Commission ordered the following:

73. Pepco is DIRECTED to investigate the viability of the "aggressive" initiatives for all least performing feeders, to file a progress report regarding the implementation of these initiatives where viable as part of the 2009 Consolidated Report, and to file quarterly progress reports thereafter, consistent with paragraph 62 of this Order;

In Order No. 15809 paragraph 11, the Commission ordered the following:

11. Pepco IS DIRECTED to include in its 2011 Consolidated Report a plan for development and application of "aggressive initiatives" to its underground distribution feeders;

Repeat Priority Feeders

In Order No. 15152 issued on Pepco's 2008 Consolidated Report, the Commission stated (at paragraph 72),

*72. PEPCO is **DIRECTED**, beginning with the 2009 Consolidated Report, to identify the feeders that are part of the separate annual program of corrective actions for reappearing least reliable feeders, describe the corrective actions planned for each feeder and the projected dates for completion of the corrective actions and explain whether the corrective actions improved the performance of these feeders consistent with paragraph 59 of this Order;*

In Order No. 15941 issued on August 18, 2010, the Commission stated at paragraphs 13 and 16, the following:

13. Beginning with the 2011 Consolidated Report, Pepco shall identify any feeders that have appeared more than once on the Priority Feeder List, by year from the first Priority Feeder List in 2002, so that it shall be apparent how many times each feeder has appeared on the Priority Feeder List…

16. Pepco IS DIRECTED to identify in its 2011 and successive Consolidated Reports, each feeder that has appeared more than once on the Priority Feeder List.

4 to 13 kV Conversions

These projects are a continuation of the 2011 Reliability Projects, as required by Order No. 16091 at paragraph 64 and referenced paragraphs 50 and 53:

*64. Pepco IS **DIRECTED** to provide detailed schedules and budgets for conversion projects, as well as justification for any non-minor deviations from these , consistent with Paragraphs 50 and 53 of this Order;*

50. Decision. We agree with the Staff recommendation and require Pepco to provide justification for any deviations from the plan schedules and annual budgets for 4 kV to 13 kV conversion projects in its Consolidated

Reports, excluding minor deviations of less than 5%. This information may be provided in the discussion of "Reliability Projects."

53. Decision. …we have not adopted the Staff's "replace or rebuild" recommendation. However, we agree that future Consolidated Reports should contain detailed schedules and budgets for Reliability Projects, as well as justification for deviations from those schedules and budgets. We shall require Pepco to submit such schedules in future Consolidated Reports.

Manhole Event Report

In Order No. 16091 issued on December 10, 2010, the Commission stated at paragraphs 56, 59, 65, and 66 the following:

56. Decision. Pepco has agreed to make the recommended changes in the 2011 Consolidated Report with the exception of data on failure rates. We require that the members of the PIWG discuss the need for and feasibility of providing data on failure rates in future Consolidated Reports and include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

59. Decision. We adopt the Staff's recommendation and require Pepco to: (1) combine the Manhole Events portion of the failure analysis report with Part 3 of the Consolidated Report; (2) include data in the 2011 Consolidated Report that separates 4 kV primary failures from 13 kV primary failures; (3) include data in the 2011 Consolidated Report that separates 4 kV from 13 kV manhole events; (4) include trend analyses for "Use of Slotted Manhole Covers;" and (5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable. If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require *the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.*

Pepco IS DIRECTED to include a discussion of failure data rates in the agenda for the Productivity Improvement Working Group, consistent with Paragraphs 56 and 59 of this Order; and

Pepco IS DIRECTED to include additional Manhole Event data in the 2011 Consolidated Report, consistent with Paragraph 59 of this Order.

In Order No. 15152 paragraphs 76 and 66, the Commission ordered the following:

76. PEPCO is DIRECTED to include as part of the 2009 Consolidated Report a proposed plan for significantly reducing manhole events consistent with paragraph 66 of this Order…

In Order No. 12735, paragraph 138, the Commission ordered the following:

Pepco shall file a report that summarizes the results of the failure analyses conducted for the calendar year 2002, 30 days from the issuance date of this Report and Order, and subsequently, to file an annual report on the results of the failure analysis group to the PIWG;

Slotted Manhole Covers

In Order No. 16091 issued on December 10, 2010, the Commission stated among other things, at paragraph 59, the following:

59. …(4) include trend analyses for "Use of Slotted Manhole Covers;" 60.

Cable Splice or Joint Database

In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. *...(5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable.*

Failure Rates

In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. ...(5)...If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the

2011 Consolidated Report the PIWG conclusions and recommendations, if any.

Appendix 3A –Manhole Events and Summary of Selected Failures

In Order No. 11716 ordering paragraph 3, the Commission ordered the following:

PEPCO shall file an annual report on the previous calendar year's manhole incidents;

Appendix 3B – Manhole Inspection Program

In Order No. 11716, the Commission stated the following:

PEPCO is hereby directed to include the following information in its [manhole inspection] reports beginning in July 2000:

The general location of the manholes inspected, including the street or streets where the manholes are located and the blocks bounding the street, e.g., M Street, NW, between 23rd and 28th streets;

The number of manholes inspected in the month, broken down as to the number of manholes containing primary cables only, both primary and secondary cables, and secondary cables only;

The number of primary cable problems found;

The number of secondary cable problems found;

The type of cable problems found in each manhole, categorized as to the physical degradation or damage of the cable, overheating, overloading, damaged splice and deteriorated cable or splice due to age;

The number of manholes with problems;

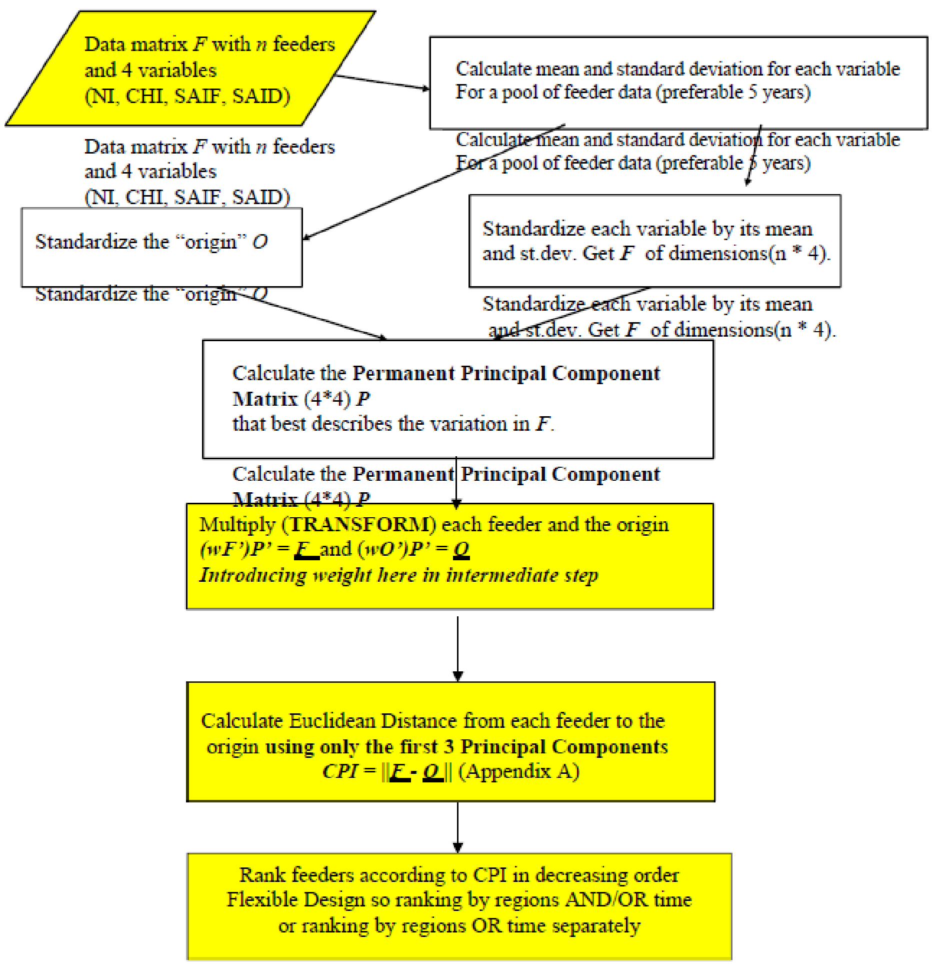
The corrective actions taken for each cable and manhole problem found; and

8. *Other general condition of the manhole such as whether it contained water, oil, grease, debris, and whether the manhole cover and the manhole are in good mechanical condition.*

Description of Calculation Process

The following flow chart (Figure 4.4-B) illustrates the process for calculating the Composite Performance Index for a feeder.

Figure 4.4-B -- Illustration of CPI Concep



Description of Euclidean Distance to Derive CPI

Definitions

Principal Component Matrix (each row is Principal Component vector)

$$P = \begin{bmatrix} PC_1 \\ PC_2 \\ PC_3 \\ PC_4 \end{bmatrix} = \begin{bmatrix} pc_{1,NI} & pc_{1,CHI} & pc_{1,SAIF} & pc_{1,SAID} \\ pc_{2,NI} & pc_{2,CHI} & pc_{2,SAIF} & pc_{2,SAID} \\ pc_{3,NI} & pc_{3,CHI} & pc_{3,SAIF} & pc_{3,SAID} \\ pc_{4,NI} & pc_{4,CHI} & pc_{4,SAIF} & pc_{4,SAID} \end{bmatrix}$$

Original Feeder Data

$$originalFeeders = F = \begin{bmatrix} f_{1,NI} & f_{1,CHI} & f_{1,SAIF} & f_{1,SAID} \\ f_{2,NI} & . & . & . \\ . & . & . & . \\ f_{n,NI} & . & . & f_{n,SAID} \end{bmatrix}$$

Weight

$$W = \begin{bmatrix} w_{NI} & 0 & 0 & 0 \\ 0 & w_{CHI} & 0 & 0 \\ 0 & 0 & w_{SAIF} & 0 \\ 0 & 0 & 0 & w_{SAID} \end{bmatrix}$$

Standard Deviation

$$\Sigma = \begin{bmatrix} \sigma_{NI} & 0 & 0 & 0 \\ 0 & \sigma_{CHI} & 0 & 0 \\ 0 & 0 & \sigma_{SAIF} & 0 \\ 0 & 0 & 0 & \sigma_{SAID} \end{bmatrix}$$

Intermediate Calculations

$$M = \Sigma * W = \begin{bmatrix} \sigma_{NI} & 0 & 0 & 0 \\ 0 & \frac{w_{CHI}}{\sigma_{CHI}} & 0 & 0 \\ 0 & 0 & \frac{w_{SAIF}}{\sigma_{SAIF}} & 0 \\ 0 & 0 & 0 & \frac{w_{SAID}}{\sigma_{SAID}} \end{bmatrix}$$

Transformation

$$\hat{F} = F * M * P'$$

$$\hat{F} = \begin{bmatrix} f_{1a} & f_{1b} & f_{1c} & f_{1d} \\ f_{2a} & . & . & . \\ . & . & . & . \\ f_{na} & . & . & f_{nd} \end{bmatrix}$$

Where

F is the original feeder data matrix (size n*4)

M is the intermediate calculation matrix (size 4*4)

P' is the (transposed) principal component matrix (size 4*4)

Finalization of CPI – Euclidean Distance Method

For each feeder i take the values for the 3 first components of row i in the last matrix above.

$$CPI_{f_i} = \sqrt{f_{ia}^2 + f_{ib}^2 + f_{ic}^2}$$

FACT SHEET

PHI

ENVIRONMENTAL STEWARDSHIP & SUSTAINABILITY:

VEGETATION MANAGEMENT ON RIGHTS-OF-WAY

A reliable supply of electricity is essential to the safety, security, economy and welfare of our nation and the communities where we live and work. To ensure the safe and reliable delivery of electricity to our customers, PHI must manage vegetation near its transmission and distribution lines and other facilities to prevent interruptions, blackouts and wildfires. PHI's regulated power delivery operations are required to maintain transmission and distribution rights-of-way so that trees, shrubs and other vegetation do not pose preventable hazards to power lines, poles or other facilities. PHI uses "best practices" to manage vegetation around electricity infrastructure, selecting among mechanical, chemical (herbicides), cultural, and biological control methods for the most suitable approach to meeting safety and reliability needs while maintaining or improving habitats for the region's indigenous flora and fauna. PHI employs professional, certified foresters and arborists to administer their vegetation management program.

VEGETATION MANAGEMENT: THE BASICS

- Utilities maintain right-of-way lands on a regular basis in order to provide for the safe transmission and distribution of electricity.
- Utilities must identify and utilize the most direct, least intrusive route possible when constructing power lines, in order to minimize both the amount of land used and any environmental impact.
- Trees and other vegetation beneath power lines must be properly maintained to avoid causing interruptions of electric service by growing into, falling through or knocking down power lines.
- In cooperation with federal, state, and local authorities, PHI, like most utilities, implements integrated vegetation management strategies to minimize overall risk to people and the environment while providing safe and reliable electric service.

HOW DOES PHI MANAGE VEGETATION NEAR ITS POWER LINES?

- PHI carefully selects vegetation management practices that balance environmental concerns, public needs, safety and cost-effectiveness.
- PHI partners with state, regional and local groups to create and maintain numerous natural habitats on its rights-of-way.
- PHI minimizes the use of EPA-approved herbicides through the selection and use of proper application methods, equipment and technology.

- PHI promotes native flora and fauna through intergrated vegetation management of our rights-of-way;
- PHI enhances vegetation management projects through cultivation or planting of compatible native vegetation;
- PHI protects native rare species populations that could otherwise be impacted by rights-of-way establishment, construction or maintenance;
- PHI manages rights-of-way areas to maintain wildlife habitat and protect threatened and endangered species habitat; and
- PHI reduces the introduction and control the spread of nonnative invasive species or noxious weeds in rights-of-way and adjacent lands.

Recognized Excellence

- All PHI utilities (Atlantic City Electric, Delmarva Power and Pepco) are active in community outreach and educational efforts to promote its **Right Tree, Right Place** initiative. **Right Tree, Right Place** advocates planting each tree species where it will thrive and not planting large species where they will interfere with power lines once they reach mature height.
- All PHI utilities have been named **Tree Line USA** Utilities by the Arbor Day Foundation. The Tree Line program is sponsored by the foundation in cooperation with the National Association of State Foresters. It recognizes utilities that demonstrate a program of quality tree care, annual tree worker training, public education, tree planting, and energy conservation through tree planting.

TREE LINE USA.

- PHI has longstanding commitments to vegetation management and green infrastructure efforts to help promote the sequestration of carbon dioxide by trees and other vegetation to stabilize and gradually reduce greenhouse gas emissions.

Pepco 2020 Safety Merger Commitments

The following attachments reflect the Company's compliance with the merger commitment described in Order No. 18148 Attachment B at P 60, Safety:[1]

Exelon is committed to having all its utilities achieve and maintain first quartile performance in safety. Consistent therewith, Pepco will file annual reports on its safety performance and safety initiatives with the Commission as part of its Annual Consolidated Report and will also present this information to the PIWG. Pepco's reporting will include a report by Exelon on its existing safety and cybersecurity policies.

- Exelon Corporate Safety Policy
- Exelon Safety Update
- Pepco Transmission and Distribution Safety Incident rate, Including Edison Electric Institute (EEI) 2012-2020 Rankings
- Exelon Cyber-Security Statement

[1] In the Matter of the Joint Application of Exelon Corporation, Pepco Holdings, Inc., Potomac Electric Power Company, Exelon Energy Delivery Company, LLC and New Special Purpose Entity, LLC for Authorization and Approval of Proposed Merger Transaction, Formal Case No. 1119, Order No. 18148, March 23, 2016, Attachment B at P 60

Exelon®

Dedicated to Safety

Corporate Policy: Safety

Policy Statement

Exelon Corporation will operate all aspects of its businesses in a manner that protects the safety and health of its employees, contractors, customers and the general public. We will foster a safety culture in which everyone believes and demonstrates that accidents, injuries and occupational illnesses are preventable and all employees understand their responsibility for maintaining a safe and healthful workplace. Further, each employee recognizes and accepts his/her right and obligation to question, stop and correct any unsafe conditions or behaviors.

Policy Intent

Exelon shall:

- Create a safety culture to achieve an accident, injury and occupational illness-free workplace;
- Comply with all applicable health and safety laws and regulations, industry and internal company standards, at a minimum;
- Integrate safety risk analysis into business planning, engineering design, and operating decisions, to develop and implement effective hazard control measures and safety performance improvement, engineering out hazards where feasible;
- Promote the value of employee empowerment in the prevention of injuries and illnesses, and maintain an open and honest dialogue with our employees on health and safety issues and performance; and
- Continually improve safety performance to become the safest electric and gas utility in the United States.

Implementation

This policy shall be implemented by establishing and maintaining:

- A corporate-wide safety program that will be integral to the Exelon Management Model based on external standards and best practices;
- Safety councils and committees, including the Exelon Operations Council, to encourage management sponsorship and employee involvement in injury and illness prevention;
- Annual objectives and targets for measuring and continually improving safety performance and recognition of top performing departments and individuals for safety is routine;
- An independent, corporate audit program and business unit self-assessments;
- Safety and health hazard evaluation programs including documented methods for controlling known safety and health hazards;
- Communications and Corrective Action Programs that facilitate the identification and resolution of safety related concerns;
- Training programs for employees and education programs for contractors on safety expectations and responsibilities;
- Employee and management personal accountability for following health and safety fundamentals and procedures; and
- Promote electricity and gas hazard awareness and accident prevention through public safety programs.

To anonymously report any safety concerns, employees or others working on behalf of Exelon can call the Exelon Helpline at 800.233.8442.

Exelon Safety Update

Exelon is committed to having all its utilities achieve and maintain first quartile performance in safety. As of the end of 2020, PHI has had a 21% reduction in OSHA recordable injuries, 29% reduction in Days Away Restricted Time Cases. This was PHI's best safety performance since 2014 (a 43% improvement from 2016 merger performance).

PHI initiated the following safety programs in 2020:

- Focused observation initiative implemented by leadership to ensure employee adherence to required COVID-19 PPE behaviors within field teams and crews.
- Alignment with other Exelon Utilities on screening strategy for employees working in high-density, critical infrastructure workspaces
- Developed shift work strategies that promote less employee interaction while maintaining necessary support levels.
- Participated with the other Exelon Utilities to continue to align safety best practices that were researched and benchmarked against Edison Electric Institute and American Gas Association utilities.
- Sustained Performance Assessment Programs by sharing incidents, lessons learned, and best practices across Exelon utilities through common communication channels.
- Continued the Ergonomic Coach program to provide Triage Support as needed in PHI overhead line school and field crews.
- PHI expanded driver training technologies and continues to leverage driver monitoring system.

Exelon has an established management model that governs key operational areas throughout the enterprise, including the safety function. The corporate Safety Policy, applicable to all Exelon operations, including Pepco Holdings and Pepco, establishes the framework for defining Exelon's industrial safety culture and sets expectations for continuously improving safety performance. It clearly sets expectations for each employee to take personal responsibility for his or her safety.

Underpinning the Safety Policy is the Corporate Industrial Safety Program, which delineates Exelon's requirements for the management of safety for the enterprise and which is based on recognized industry standards including BSI-OHSAS 18001, OSHA Voluntary Protection Program and ANSI Z10.

Detailed procedures (*e.g.*, Hazards Assessments) are maintained to affect the Safety Policy and programs, and they are routinely evaluated to ensure that best practices are utilized.

To ensure alignment and to facilitate learning, a Corporate Safety Council comprised of safety officers from each business addresses strategic safety issues, and a Corporate Safety Peer Group comprised of safety professionals and managers focuses on operational experience and use of best practices. Pepco is represented on both of these functions. In addition, the Exelon Utilities have a Safety Peer Group, with representation from each utility, including Pepco Holdings, who concentrate on improving safety performance in their specific operations.

As part of the safety performance oversight function, Exelon's enterprise-wide safety

performance is reviewed at Quarterly Management Meetings (QMM) and a comprehensive review of the effectiveness of the safety policy and program is reviewed with the senior leadership team annually.

Further, the Exelon Environmental, Health & Safety Audit Program conducts independent assessments of the effectiveness of Exelon's compliance programs at a select number of locations annually. The results of the audits are reported to senior leadership, who have responsibility for affecting any corrective actions required.

Pepco Transmission and Distribution Incident Rate, Including Edison Electric Institute (EEI) 2019 Rankings

Year	Incident Rate	EEI Quartile Ranking
2012	1.89	Third Quartile
2013	1.79	Third Quartile
2014	1.52	Third Quartile
2015	1.68	Fourth Quartile
2016	2.16	Fourth Quartile
2017	1.51	Third Quartile
2018	1.20	Third Quartile
2019	1.05	Second Quartile
2020	0.94	Second Quartile

Exelon Cyber-Security Statement

As one of the nation's major critical infrastructure providers, Exelon recognizes that the safety, reliability and security of our systems and facilities are a top priority. The company utilizes a risk- based, intelligence-driven security approach to implementing a comprehensive set of cyber and physical security controls, in line with the National Institute of Standards and Technology's (NIST) Cybersecurity Framework to effectively identify, protect, detect, respond to and recover from a spectrum of threats, mitigating the likelihood of successful attacks and their potential impacts. In addition, Exelon has implemented the mandatory regulatory requirements defined within the NERC CIP and NRC standards, ensuring further protection of cyber assets critical to the safe and reliable operation of the BES and Nuclear from cyber threats. Regulated critical cyber assets are isolated within restricted networks, segmented from the enterprise IT environment and the Internet, continuously monitored for malicious activity, and routinely evaluated for vulnerabilities.

Re: <u>Pepco-DC Vegetation Management</u>

Dear Ms. Westbrook-Sedgwick:

In accordance with Order No. 19119, and Pepco's December 20, 2017 letter electing to adopt performance-based vegetation management reporting, I, Bill Sullivan, hereby verify that Pepco has in place a comprehensive vegetation management plan, which is fully implemented and was in place in 2017, and that its practices during 2020 conformed to the plan.

Sincerely,

Will Sull

Annual Consolidated Report

Downtown Resupply Description (updated, if appropriate):

The Downtown Resupply project will replace aging 34 kV and 69 kV supply feeders to the L Street, F Street, Georgetown, and 22nd Street Substations. This work along with upgrades to the F Street Substation and extension of new 13 kV feeders will accommodate load transfers from I Street Substation as well as increasing sub-transmission supply capacity and providing reliability benefits to the District of Columbia.

Explanation of Significant changes to Project:

As discussed above, Pepco is retiring the 34 kV Transformer sources at L Street Substation and replacing them with 69kV transformer sources. As a result of this change, some of the construction dates have changed below.

Cost Estimate (provided in Formal Case No. 1144):

Items	Estimate Net (Lifecycle) ($)
Downtown Resupply	494,028,210
13kV Distribution Cutovers "F" St to "L" St (UDLPLM7W27)	39,849,304
13kV Distribution Cutovers from "I" St to "F" St & "L" St (UDLPLM7W28)	32,434,952
Champlain to L Street 34kV (UDLPRM4WA8)	102,319,736
F St Sub Rebuild (69kV) (UDSPLM718A)	50,372,188
F St Sub Rebuild (UDSPLM717A)	33,581,458
L St Sub Capacity Expansion Work (UDSPLM722A)	4,011,558
Repl 69kV Self-Containd UG Supl-Georgetown,"F" St, 22nd St Subs (UDLPRM5SG)	177,223,136
Retire "I" St Sub (UDSPRD27RD)	2,081,496
Retirements for Downtown Resupply 34kV and 69kV for DC (UDLPRM4RDR)	35,522,470
Retirements for Downtown Resupply 34kV and 69kV for MD (UDLPRM4DRM)	1,309,199
Retirements for Downtown Resupply 34kV and 69kV for VA (UDLPRM4DRV)	13,322,712
Telecom - 22nd Street Sub (UDFPO22SS)	500,000

Telecom - Fiber for 34-69kV Resupply Champlain, L Street, F Street (UDFPOCL01)	500,000
Telecom - Georgetown Sub (UDFPOGS01)	500,000
Telecom - L Street Sub (UDFPOLS01)	500,000

Current Cost Estimate:

There are no changes to the cost estimate for the Downtown Resupply Project cost estimates as of March 31, 2020.

Updated Construction Schedule:

L Street Substation: 2023-2025
F Street Substation: 2025-2028
I Street Substation: 2029-2030
69kV Supplies: 2022-2028
34kV Supplies: 2019-2025
13kV Supplies: 2019-2029

Updated Construction Schedule:

Please see above updated construction scheduled as of April 15, 2021

AN EXELON COMPANY

Contents

INTRODUCTION

Potomac Electric Power Company (Pepco or the Company) herein presents its 2022 Consolidated Report (Report) combining three reporting requirements directed by the District of Columbia Public Service Commission (Commission) in Formal Case Nos. 766 and 991. The three reports comprising the Consolidated Report are:

1) the Comprehensive Plan for the Planning, Design, and Operation of the Distribution System within the District of Columbia (Comprehensive Plan),
2) the Productivity Improvement Plan (PIP), and,
3) the annual Manhole Event Report. Additionally, a section of References has been included at the end of the report.

The following is a brief description of the four parts of this Report:

Part 1: Comprehensive Plan

During Commission hearings on November 5-7, 2001, addressing Formal Case No. 991, the Commission issued directives, followed by Order No. 12293, requiring the Company to produce and submit its first Comprehensive Plan on February 8, 2002. Pepco's filed report presented a compilation of major elements of its underground distribution construction and plans as well as supporting technologies and conversion programs to improve system reliability. Over the years, the Comprehensive Plan's content evolved with Commission Orders. The 2022 Comprehensive Plan's content is similar to the 2021 Comprehensive plan, however in contains additional detail that complies with the Commission's July 23, 2021, Order No. 20776 [1]

Part 2: PIP

On November 1, 1982, in Order No. 7668, the Commission adopted final rules regarding the submission of an annual PIP in Formal Case No. 766. These rules are codified in Title 15 of the District of Columbia Municipal Regulations, Chapter 5, Rules 502.1 and 502.2. Because of the divestiture or transfer to an affiliate of all of Pepco's generating stations, most of these rules are no longer applicable to Pepco's operations. Instead, this PIP was compiled pursuant to the latest requirements for Pepco to report on its transmission and distribution system operating performance and measures to improve service reliability.

[1] .C. Formal Case No. PEPACR-2016-01, Order No. 20776

Part 3: Manhole Event Report

In 2000 in Formal Case No. 991, the Commission issued Order No. 11716 requiring Pepco to file an annual Manhole Event Report on the previous year's manhole incidents. The Manhole Event Report includes statistics regarding reportable events, a trend analysis for slotted manhole covers, and a listing of splice data. Appendix 3A contains a listing of 2021 Manhole Events. Appendix 3B includes a discussion of the 2021 Manhole Inspection Program including annual program results. Appendix 3C contains Pepco's update on the implementation of its Network Accuracy Procedure.

Part 4: References

Part 4 of the filing contains a compilation of abbreviations, acronyms, and technical terms and diagrams; and a section providing Commission Order references delineating the history of the Consolidated Report requirements.

PART 1: 2022 COMPREHENSIVE PLAN

Section 1 – SYSTEM PLANNING[2]

The mission of System Planning is to develop a rational and orderly plan for Pepco's existing and future electric system needs that will provide reliable electric service to customers and support load growth in a cost-effective manner. In order to accomplish this mission, the North American Electric Reliability Corporation (NERC) / Reliability First Corporation (RFC) Standards and Pepco's Planning Criteria for the transmission, subtransmission, and distribution systems govern the design of the electric system.

Pepco continuously analyzes the adequacy of its electric system to meet demand for energy on its system and to plan for future growth. The Company maintains engineering and operating criteria for use in the design of new and modified portions of the system. To provide for rational and orderly changes to the electric system, Pepco has developed engineering and operating criteria that it applies to the design of

[2] The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. The Commission requested that the Company provide a Comprehensive Plan detailing proposed changes to the electric system for the purposes of meeting load growth or maintaining system reliability. On pages 143-144 of the hearing transcript, Pepco's Witness Gausman explained the nature of the Company's existing plans for the distribution and transmission systems. The Company expanded its responses to the Commission's requests in the first filed Comprehensive Plan. Since that date, the Company's Comprehensive Plans have been expanded based on several Commission directives. The report that follows either expands upon the discussion in the initial hearings requesting the Consolidated Report or responds to subsequent Commission directives as cited below.

The following section of the report addresses system plans based on forecasted load growth. In Order No. 12804 paragraph 53 B, the Commission stated the following:

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO: (b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report.*

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO:*
>
> *(b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report.*

new and modified systems. The three major components of system planning criteria are (1) voltage and reactive support, (2) ratings of facilities, and (3) reliability. For example, voltage on a nominal 120-volt system must be maintained between 114 and 126 volts under normal conditions and between 105 and 126

volts under contingency conditions. Ratings of facilities include normal, emergency, and short-term emergency ratings on all facilities including feeders, power transformers, circuit breakers, for both summer and winter periods. In terms of reliability, the data that are reviewed and tracked include historical and forecasted load compared to capacity of the feeders, feeder groups, and substations.

1.1 The Current Load Forecasting Process

Planning for future load growth starts with the development of load growth projections. A forward- looking 10-year peak load forecast is developed and maintained for each distribution system component such as feeders, substation transformers, and substations to plan for longer duration projects. Short-term, summer-peak forecasts are developed for three years to address the more frequent changes from new building construction and customer load growth that occurs across the distribution system. Long range forecasting (four to ten years) is used to develop advance plans for longer duration projects or construction projects that require more than two or three years to complete, and to identify future capital projects in the Construction Budget Forecast process.

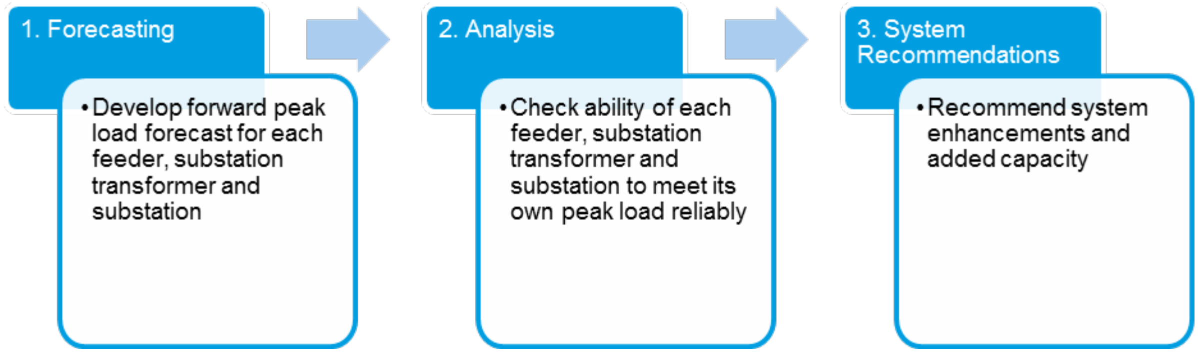
Forecasting begins with the examination of the summer historical loads for each feeder and substation on a two-year cycle. Further, actual new customer loads from submitted class of service forms and other available development reports, planned changes in feeder configuration and emergency transfers, and reductions due to distributed energy resources (DER) are also analyzed. The individual feeder and feeder group loads for each year are calculated and adjusted to produce the substation load predictions for each year of the plan.

Over the past year, Pepco has implemented a new planning tool, the Distribution System Planning Load Forecasting (DSP-LF) program. This program compares the historical weather patterns for the previous year against a thirty-year record of weather patterns. Feeder and Substation loads during the summer and winter periods are adjusted to match the values expected during temperature extremes projected to occur once in a ten-year period. These historical values are projected by the program into the upcoming ten-year period by adding new customer load requests submitted by the developers and anticipated area growth trends beyond the submitted requests, including anticipated electric vehicle charging loads and fossil fuel heating system conversions. The program also incorporates the anticipated load reductions anticipated from DER submittals, DER predicted installations, and general demand response commands. The planners review these before case load projections for predicted overloads of the feeders and substations and use the program to identify likely corrective actions, including non-wire alternatives, that can be used to relieve the facility overload for several years. One of the strengths of this program is to assist in review of corrective measures that adjust the energy use over the day, such as Battery Energy Storage Solutions (BESS) and Targeted Demand Response (TDR). These types of measures can reduce the peak power demand but will increase energy use on the feeder or substation during off peak periods, which must be analyzed to assure proper operation of the distribution system throughout the following day.

A challenge in using this tool has been anticipating the future load response to the COVID protocols put into place by the communities that Pepco serves. The weather-load patterns for the previous two years are significantly reduced from the pre-COVID patterns. Pepco anticipates the system load patterns will return to similar patterns from pre-COVID periods; however, as COVID protocols are being removed, planners will review the system load response and will adjust load projections to match their findings.

1.2 Peak Load Forecasting Process

Figure 1 General Planning Process for Distribution Feeders, Substation Transformers, and Substations



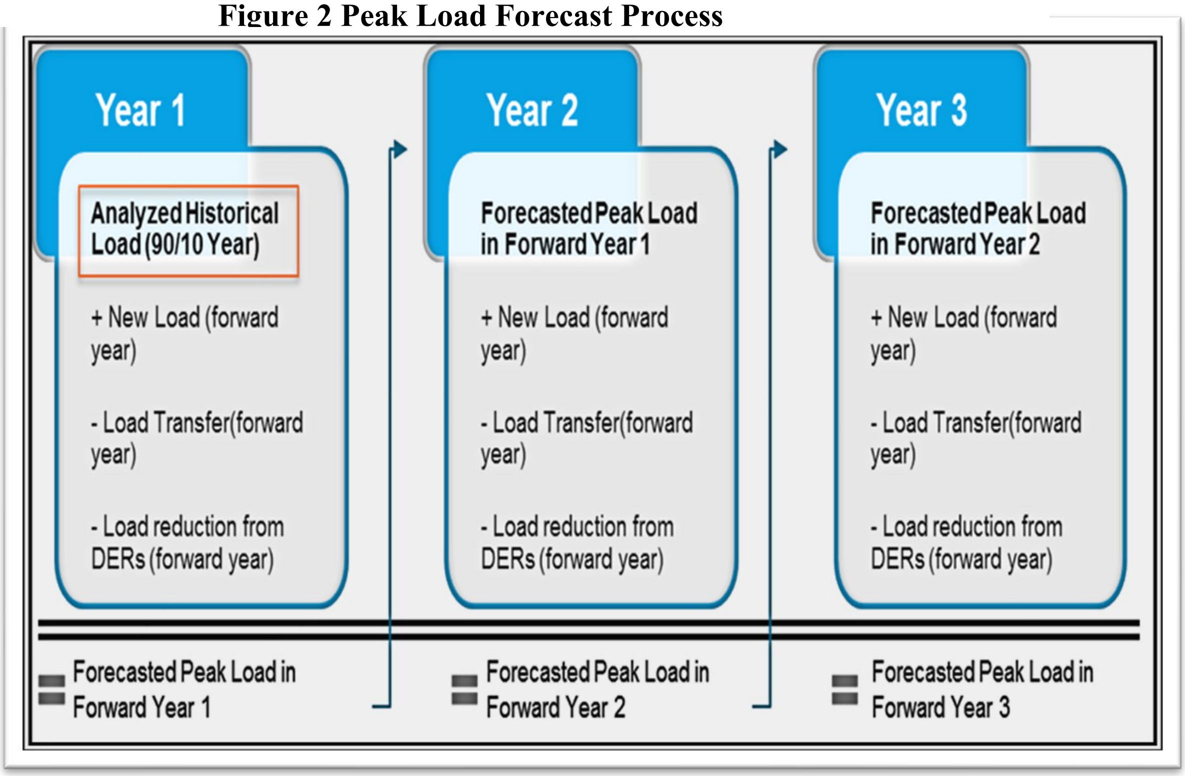
As described in Figure 1, the development of the peak load forecast is the first step in Pepco's distribution system planning process. The development of the forecast is a critical step because it has an impact on the outcomes of each subsequent step in the process and, ultimately, the timing and magnitude of the investments in the distribution system made by Pepco.[3] This section provides additional details on the analytical processes Pepco employs to develop its peak load forecast and the way in which DERs are incorporated into these processes.

It is important to note that Pepco must create more than just one peak load forecast. In fact, it creates many – one for each distribution feeder, individual substation transformer, and substation on its system. The creation of peak load forecasts for each distribution system component is needed to ensure that both individual system components are sized appropriately, and that the system as a whole will perform as it should.

This peak load planning process is depicted in the following figure:

[3] Consistent with PHI's regulatory obligations to provide safe, reliable electric service to its customers.

Figure 2 Peak Load Forecast Process



1.3 Short-Range and Long-Range Peak Load Forecasts

The peak load forecast is comprised of a short-range forecast for future years 1-3 and a long-range forecast for future years 4-10. This short-term forecast also serves as the basis for the development of the longer term 10-year plan. The former is a detailed, "bottom-up" analysis of historical peak load data, projected new load growth and energy reduction initiatives. The latter is a higher-level and "top- down" trending effort based on the PJM (the regional transmission operator or "RTO" responsible for maintaining the stability of the transmission system in Pepco's region) system peak load forecast. The short-range forecast is generally formulated in accordance with the calculation detailed in Figure 2.[4] For the purposes of this report, terms are defined as follows:

- **Analyzed Historical Peak Load** – This value serves as the base value from which future projections are calculated. This value is most often derived for each distribution system component by taking its actual historical peak load[5] in the hottest year within the last ten years,[6]

[4] Specific circumstances may merit variations in this calculation process.

[5] As recorded within the SCADA and AMI systems.

[6] Pepco plans to the hottest year in the last 10-years to develop its peak loads for each distribution system component in the short-term load forecast. Pepco uses the 90/10 forecast produced by PJM as the basis

and adding to it the incremental load changes (i.e., new loads, load transfers and load reductions from DERs) that have occurred between that hottest year and the year prior to the current year.[7]

- **New Load** – This represents additional new load that is anticipated to come online as a result of new building or development activities. At times and in some areas of Pepco's service territories, this value may be negative such as when an existing customer facility closes. New loads are added at the anticipated level of load that Pepco expects a building of the same size and energy use would add to the distribution system.
- **Load Transfers** – These are projects that Pepco conducts to utilize available capacity in one portion of its distribution system to help meet a projected capacity shortfall in another part of the system. Such projects may include re-routing feeders from one substation to another or transferring a portion of one feeder to another feeder. These types of projects occur seasonally on the distribution system and are a way of managing load without undertaking more expensive upgrades or construction. Such projects are planned ahead of time and have an impact on the forecast in future years. As a result, these projects are accounted for in the process. These are permanent redistributions of load that must not cause a total projected load to exceed the normal rating of the component, as opposed to the contingency load transfers which occur during outages to help sectionalize and restore customers' service and can result in a component operating up to its emergency rating.
- **Load Reductions from DERs** – Distributed Energy Resources may, depending on their

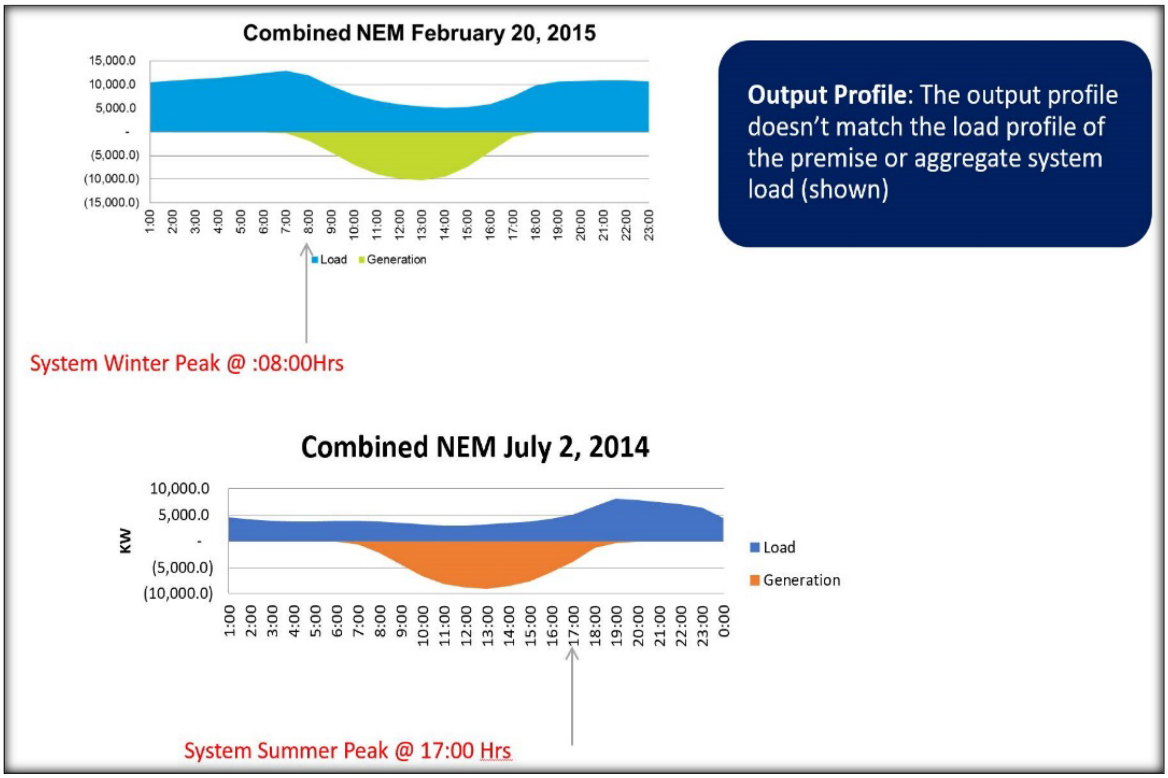
of its long-range growth forecast in order to ensure that each utility has adequate system capacity to meet area load needs during seasons with extremely hot weather. The 90/10 forecast is produced by PJM to depict peak loading that has a 10 percent probability of occurring in any given year. For capturing peak historical loadings, Pepco's methodology uses actual load readings for each component during years of extreme (one in ten year) weather. For years when less than extreme weather occurs, Pepco uses the load of the latest extreme summer, making adjustments to the load to account for prospective new businesses (PNBs), load transfers, DERs and other factors. By employing this historical loading methodology, Pepco can seamlessly transition from the historical loads used to develop its short-term plan to the long-term forecast using the PJM 90/10 loads as the basis for the trend in growth. This process also assures that no peak load used for future planning is more than 10 years old.

[7] On occasion, this method will result in a value that is less than the peak load encountered in the year prior to the current. This may occur because actual load growth on a feeder is greater than what Pepco would arrive at through its calculation (i.e., the addition of new load only from new build). In such cases, Pepco will use the actual peak load (i.e., via SCADA and AMI readings) from prior years as the Analyzed Historical Peak Load, to ensure that it is planning the distribution system to meet its maximum load requirement.

operation, reduce peak load. Whether or not these resources reduce peak load depends on the coincidence of the resource with the time of peak load on a particular distribution system component. The degree to which a DER contributes to a reduction in peak load depends on its output (which may be variable) and its contribution to total load at the time of peak load.

In addition, energy efficiency measures that are known are reflected in the historical loads that are being measured for each facility. Figure 3 is an example of a chart that shows the effects of Net Energy Metering (NEM) facilities on feeder peak loading.

Figure 3: Example of Impacts of PV on Feeder Peak Loading



1.4 Long-Range Forecast

Upon completion of the short-range forecast, Pepco then completes the long-range forecast for years 4-10. Pepco's process for completing the long-range forecast generally occurs via the following steps:

1) Pepco first conducts a trending of the short-range forecast beyond its duration (within years 1-3) and into the window of the long-range forecast (years 4-10).

2) Pepco then adjusts this trending of peak load for each feeder, substation transformer, and substation for larger-scale system changes and factors that are known to be planned within the

long-range forecast window. These changes may include considerations such as major long-term redevelopment initiatives within a geographical area.

3) Finally, Pepco adjusts the projected year-by-year long-range peak load growth on each distribution system component such that the growth rate of the system-level peak load of Pepco's long-range forecast is reconciled with the rate of growth within the corresponding PJM long-range load forecast. Pepco reconciles the growth rate of its long-range forecast with PJM's 90/10 long-range forecast to ensure consistency across the planning process of the entirety of the power delivery system, inclusive of the distribution system under Pepco's purview and the transmission and generation systems under PJM's purview.

Pepco must plan for the reliable operation of each feeder, substation transformer, and substation at its individual peak load (MVA). These individual equipment peak loads generally do not coincide with one another and are thus generally referred to as being "non-coincident" peaks. Moreover, the sum of individual non-coincident equipment peaks generally exceeds the peak load demanded of the collective whole at any given time. In other words, Pepco must plan for its "non-coincident" peaks for each component of the distribution system while PJM must plan for the coincident peak that the transmission system is required to serve.

1.5 Feeder, Substation Transformer, and Substation Analysis Process

Once the peak load forecast is completed, Pepco analyzes the capabilities of each distribution system component to ensure that it can reliably meet its forecasted peak loads. Planners use the Prospective New Businesses (PNB) and DER information gathered in the load forecasting process along with historical Advanced Metering infrastructure (AMI) customer load data, System Control and Data Acquisition (SCADA) and electrical configuration information from Pepco's Geographic Information System (GIS) to model each feeder in its power flow analysis software. From this analysis, predicted system violations such as low voltage and thermal overloads are identified and resolved through the system recommendations process.

1.5 System Recommendations Process

Upon completing its analysis process, Pepco considers the specific predicted system violations to develop recommended actions, which may consist of:

- Operational measures – Resetting relay limits, conducting phase balancing, or other measures;
- Load transfers – Conducting field switching to transfer load from a higher loaded feeder to a lower loaded feeder;

- Short-range construction projects – Feeder extensions, installation of capacitors or voltage regulators, reconductoring, NWA solutions; and
- Long-range construction projects – New feeder extensions, new substation transformers or entirely new substations, and NWA solutions.

Once the recommended actions are identified, an area plan containing construction recommendations is issued.

1.6 Factors Guiding the Consideration of DERs in Pepco's Peak Load Forecast

DERs are considered in the peak load forecast and, therefore, are reflected in the entirety of the distribution planning process that follows. How or whether a DER is counted as providing a peak load reduction depends on the availability of that resource during the peak load time for the component of the distribution system being assessed. The magnitude of impact of a DER to be counted toward reducing load depends on the level to which that resource can be relied upon to provide a load reduction at that specific point in time when the peak load will occur on the component being assessed.

1.7 Availability of a DER at the time of Peak Load

A DER may or may not be available or in operation at the time of distribution feeder, substation transformer, or substation peak load. This is an important factor that has an impact on how the resource is considered in the peak load forecast, and ultimately the entirety of the planning process. The examples below illustrate some of the potential scenarios to be contemplated when incorporating DERs in the planning process:

- A customer completes an energy efficiency upgrade consisting of the installation of a new energy efficient air conditioning unit in place of an old unit – this would result in a permanent load reduction, and thus this DER (the EE upgrade)—if known to Pepco—would be fully available at the time of peak load on the distribution feeder, substation transformer, and substation from which this customer is provided service, and would thus be considered a resource that reduces peak load on these components.
- A commercial customer installs a large diesel generator that is run on occasion to supplement the customer's energy usage at the time of the customer's maximum energy demand, which occurs seasonally in mid-spring and not in the summer when the local distribution system experiences

a peak load. Therefore, the diesel generator would not be a resource toward reducing peak load on the distribution feeder, transformer, and substation from which this customer is provided service.

- Several customers install small-scale residential solar systems on their roofs. In a given area, these DERs would be considered available at the time of peak load on the distribution feeder, substation transformer, and substation from which these customers are provided service. The total percentage of nameplate capacity considered to be available can be determined using a back casting analysis that relates the hourly capacity factor[8] of the DERs, the hour of the peak load on the component, and the total nameplate capacity on the component. Therefore, this would not be considered a firm resource counted toward reducing peak load on the distribution feeder, substation transformer, and substation from which this customer is provided service.
- A commercial developer installs a utility-scale battery system on a distribution feeder that is discharged during peak load periods on the transmission system. Therefore, most likely this would not be a resource counted toward reducing peak load on the distribution feeder, substation transformer, and substation from which this customer is provided service, because distribution system peaks do not necessarily coincide with the peak load on the transmission system.

In order to be considered as a planning resource, a DER must be "firm." In other words, it must be available at the time of peak load. Pepco's system planning criteria dictate that a DER is considered firm and is thus a dependable resource for peak planning purposes, if it is available (or coincides) 95% of the time with the peak on whichever component of the distribution system is being evaluated (feeder, substation transformer, or substation).

Planners, however, must also consider the consequences to the system when the DER is not available such as after restoration from a momentary or sustained power outage. For example, current industry standards and local electric codes mandate that all inverter-based systems (e.g., solar PV) automatically disconnect from the utility feeder upon loss of power.[9] When the feeder is reenergized, loading observed on that feeder is now the full load without the reduction from the solar generation until the inverters reconnect the customer PV back to the distribution system, which generally occurs after a minimum of five minutes. For planning purposes, the reduction from solar PV is added back into the loads of each distribution system component and those loads are compared to the emergency capacity ratings of the feeders and substation transformers and to the firm capacity rating of the substation. This Capacity Factor is defined as the average

[8] Capacity Factor is defined as the average power generated for a specified period of time divided by the rated nameplate power of the generating asset.

[9] IEEE 1547.

power generated for a specified period of time divided by the rated nameplate power of the generating asset.

This ensures that Pepco maintains adequate capacity during times when customer generation is unavailable, consistent with its regulatory obligation to provide safe, reliable electric service. Actions to be taken by the planners as a result of this analysis will depend on which component is overloaded and what actions that can be taken to mitigate the overload until the solar PV systems begin to generate and reduce customer net loads. For example, if the only overload that exists is at the substation level, then restoration can be performed in stages to mitigate the risk of an overload and no further system enhancements would be needed.

Planners also consider the effects of distributed generation being offline during an outage event when Automatic Sectionalizing and Restoration (ASR) schemes are operated through automated inline and tie switching devices. These ASR schemes are designed to automatically operate in order to isolate a fault during a feeder outage event and restore as many customers as possible. During the outage event, it is anticipated that all distributed generation on the affected feeder will have tripped off due to loss of utility power. Planners must analyze the potential transfers[10] to examine if the receiving feeder/substation transformer/substation can handle the extra load being transferred to it through automated switching. Planners design ASR schemes to maximize the amount of time during the year that there is adequate capacity to back-up an adjacent feeder.

1.8 Magnitude of Impact (kW) of a DER at the time of Peak Load

While some resources which meet the firm criteria are considered permanent load reductions (e.g., Conservation Voltage Reduction (CVR), Energy Management Tools (EMTs) and other programmatic energy efficiency) additional analysis is required for other types of DERs to calculate the magnitude of the impact of the resource. This is particularly evident for variable generation sources such as solar PV. Over the course of a 24-hour period, hourly production of solar PV can range from 0% to 100% of nameplate capacity. Therefore, calculating the magnitude of the impacts requires considering several pieces of related information:

[10] The total load to be transferred would be equal to the load that existed just prior to the outage plus the total available PV generation on the circuit. Once all load is transferred and customers are restored to service, the solar PV systems will be restored, and load will be reduced to pre-outage levels.

- Actual or simulated production of the resource (in the case of distributed generation without dedicated metering and telemetry, a back casting process is used to simulate production based upon conditions in a representative area);
- The amount of nameplate capacity of the DER interconnected to a distribution system component; and,
- The hour and magnitude (MVA) of the peak for the distribution system component being evaluated.

1.9 Customer Growth Projections and Historical Comparisons[11]

Pepco's System Planning group forecasts electric load growth to plan for future additions to the electric system. Changes in the number of customers do not necessarily correspond to a similar change in load since neighborhoods containing specific types of customers may be redeveloped into ones containing different types of customers with different load characteristics. For example, former industrial zoned districts can be re-zoned to permit mixed use development. In addition, existing customers may increase their load, which has no effect on the customer count. Both new customer additions and increases in existing customer load are factors used in forecasting load growth. The increase or decrease in the number of customers can have an impact on system load. However, the more critical information is the amount of load that a customer uses. Thus, Pepco focuses on forecasting system load growth with future development and associated customer counts as an input.

District of Columbia customer counts for six years (2016-2021) are provided on a substation basis in Table 1. Substations have been assigned to District of Columbia wards based on their location rather than the area they serve.

Load Growth Projections and Historical Comparisons

Pepco's load growth projections and historical comparison data are shown in the following tables: Table 2 provides six years of historical loads, and Table 3 provides Pepco's projections for electric load growth in the District of Columbia for 2022 to 2031. The 33 substations listed in Table 1 represent all the 13 kV distribution substations as well as the 4 kV substations not supplied by a listed 13 kV substation within the District of Columbia. Pepco tracks and projects load by substation. Substations have been assigned to one

---

[11] In Order No. 12735 issued on May 16, 2003, the Commission directed (paragraph 139) the following:

> *139. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:*
> *(a) Customer growth projections by District of Columbia wards (including historical comparisons);*
> *(b) Load growth projections encompassing commercial and residential development by District of Columbia wards (including historical comparisons);*
> *The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.* In Order No. 12804 (paragraph 53) the Commission directed the following:

> *53. The 2003 PIP is hereby APPROVED, provided that PEPCO:*
> *(a) Provide the projected zonal and projected default (i.e., SOS) load data for the District of Columbia to the PIWG on a quarterly basis as well as in the 2004 and subsequent PIPs;…*

of the eight District wards based on the substations' locations rather than the area where they serve. Because feeders may cross ward boundaries, all feeders emanating from a substation will be assumed to supply load in the ward to which that substation is assigned.

Notes: All substations supply 13.8kV of primary power unless otherwise noted.
Loads shown are actual readings taken during peak summer conditions.
Totals shown are the sum of undiversified peak loads and are not meant to be used as official Pepco system peak loads.
Trends shown are based on the straight line regression of the loads and include transfers amongst the substations.

Notes: All substations supply 13.8kV of primary power unless otherwise noted.

Totals shown are the sum of undiversified peak loads and are not meant to be used as official Pepco system peak loads.

Totals shown include planned transfers, DERs, NWAs and known new business loads.

The District of Columbia has experienced uneven overall load growth from 2016 to 2021, as there are certain neighborhoods that have been growing relatively rapidly and other neighborhoods that have reduced load. Pepco attributes the reduction in loads to a marked increase in the number of customer owned Photo Voltaic (PV) solar generation connections and energy efficiency measures. Pepco's planning process examines historical load data on its substations and feeders, then examines PNB report data and internal and external reports regarding the load reductions due to DERs to develop a short-term forecast for each feeder and substation. Pepco uses trends developed in the short-term forecasting process combined with information about long-term neighborhood development projects and DERs to determine the long-term forecast for each feeder and substation. The trend analysis also takes into consideration energy efficiency activities that customers have supported during the past years and further uses AMI data from recently constructed buildings to refine expected loadings for new buildings. Developing energy usage trends will reflect these reductions in aggregate and are included in the decision-making process to determine when and where increased capacity is needed.

1.10 Incorporation of Field Information into the Planning Process[12]

Pepco's planning process incorporates Equipment Condition Assessments (ECA) and other field information into its short-term and long-range plans, when applicable. The planning group creates long-range plans to upgrade or replace utility infrastructure evaluated to be approaching end-of-life.

The capacity planning group is an active participant in ECA meetings and is the sponsor of substation transformer and switchgear replacement projects. The planning group participates in decision making regarding actions to take when equipment is evaluated to be near end-of-life, including whether to replace the equipment in kind or through a new capital project. The decision depends upon how close to failure a

[12] Order No. 16975 states the following at paragraphs 89 and 116:

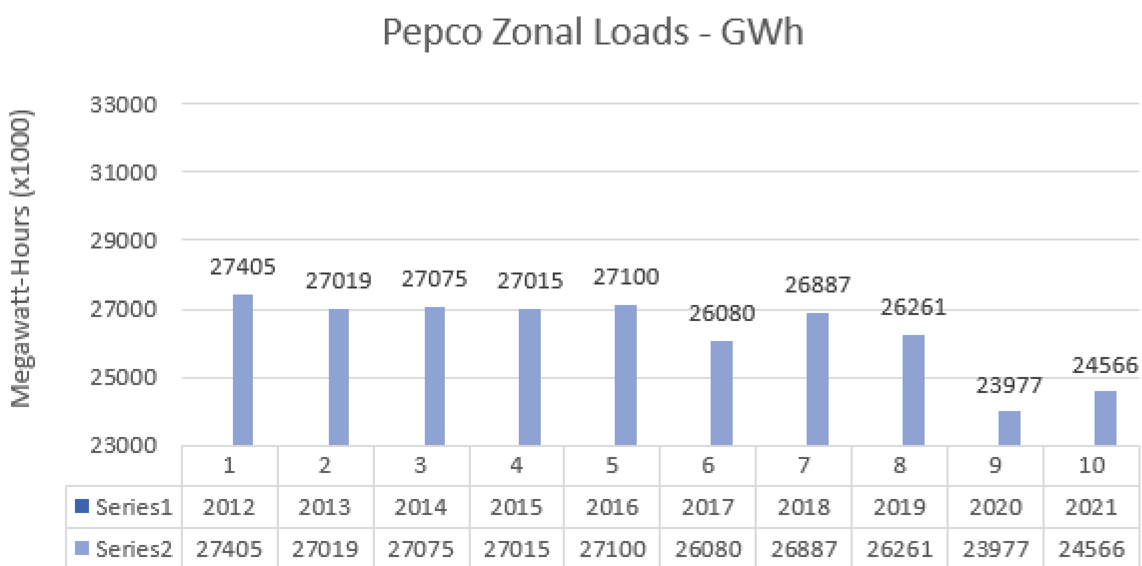
89. Decision: The Commission believes that OPC's recommendation has merit. However, we understand that equipment condition assessments may be included within the distribution system planning process, as shown in the description of the Pepco Planning Process provided by OPC at "Existing System Analysis." We direct Pepco to explain in the 2013 Consolidated Report the extent to which field information is considered within "Existing System Analysis."

116. Pepco is DIRECTED to provide field information consistent with paragraph 89 herein;

piece of equipment is evaluated to be, what other load-driven or reliability-driven capital projects are in the area, and the age and condition of other equipment in the substation.

On a system basis, Pepco's control area loads over the ten-year period between 2012 and 2021 are provided in the table below.

Table 4: Pepco Zonal Load



Note: Zonal Load excluding SMECO.

Pepco's projected monthly and annual zonal loads for 2022 are provided in Table 5. Pepco's zonal loads are for the Pepco distribution system (Maryland and District of Columbia), excluding the Southern Maryland Electric Cooperative (SMECO) and include demands for Pepco distribution customers.

Table 5: Pepco Zonal Load 2022 Forecast

1.11 Power Factors and Energy Loses[13]

Power Factors

The power factor provides one measure of how efficiently Pepco's electric system is being used. Substation load has two components: real power (kilowatts) and reactive power (kilovars). Real power is the power that serves the customers' end-use electrical devices. Reactive power does not serve customer requirements but decreases the substation's ability to deliver real power and increases system losses. This reduced ability to deliver real power is based on a substation's power delivery limitations. The power delivered is a combination of reactive and real power, so the greater the reactive power, the lower the real power that can be delivered. As the system power factor approaches unity, real power delivered is greater and system losses due to reactive power are reduced. By making appropriate use of capacitors, the reactive power flow on the electric system can be reduced such that it approaches zero. (When the reactive power flow is zero, the power factor is unity (*i.e.*, 1.0) A unity power factor would be ideal and would result in the maximum usable power being delivered to the customers. However, a unity power factor is not technically or economically practical to maintain because of changing loads and system conditions.

Pepco plans for a 98% (.98) power factor or higher on its 4 kV and 13 kV distribution substations at

[13] n Order No. 10133 (at 10 and 12), the Commission directed Pepco to include performance factors relating to the transmission and distribution (T&D) system in future PIPs.By way of compliance with the above requirements, in the September 1993 PIWG Meeting, Pepco proposed reporting performance data on its 13 kV distribution substation power factors.

the summer peak. Table 6 below provides the percent of all Pepco's 4 kV and 13 kV distribution substations that had power factors ≥ 98% at the summer peak hour for the years 2012 - 2021. In 2021, 96% of the 4 kV and 13 kV substations had a power factor of ≥ 0.98 at the summer peak hour.

Table 6 Power Factor - % of Pepco Substations with Power Factors Greater than 98% on Peak Summer Days (System-wide)

	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
% of 4 kV and 13 kV Substations with Power Factor ≥ 0.98	96%	97%	97%	97%	97%	96%	92%	89%	91%	96%
Total Number of 4 kV and 13 kV Distribution Substations (Pepco system-wide)	116	115	115	113	112	112	113	113	112	111

Annual System Energy Losses[14]

Table 7 shows a ten-year comparison of annual system energy losses for PJM and adjacent utilities. 2011 through 2020 were obtained from the Federal Energy Regulatory Commission (FERC) web site. All data are from FERC Form 1. A comparison of annual system energy losses over the past ten years is provided for PJM utilities and utilities adjacent to the Pepco service territory. Pepco's system energy losses for 2020 are 4.15% or approximately 15% lower than the group average of 4.89%.

% Annual System Energy Losses:

$$\text{\% Annual System Energy Losses} = \left(\frac{\text{Total Energy Losses (FERC Form 1, Line 27, page 401a)}}{\text{Total Energy (FERC Form 1, Line 28, page 401a)}} \right) \text{X } 100$$

[14] Industry comparison of annual system energy losses is presented in Table 7

1.12 Substation Additions and Enhancements[15]

The discussion below updates the information provided in the 2021 Consolidated Report. All planning data is based on current information and may be revised as the Company completes final designs, fully evaluates site conditions, receives permitting and zoning requirements and receives final contract and equipment bids. This information could impact both the costs and timing of a project. Costs presented reflect forecasts based on approved budgets and include related transmission, distribution, real estate, and permitting costs. Plans associated with the L Street Substation have been removed from this list as they are being rolled into the long-term Downtown Resupply plan.

Table 8 reflects Pepco's planned substation additions and enhancements for the District of Columbia with their anticipated in-service dates based on current data and analysis as well as approved budgets. In-service dates are, therefore, tentative and are adjusted as in-service dates become nearer.

Table 8: Substation Additions and Enhancements

#	Project Cost	Project Description	Projected In-Service Date	Areas Served
1	**$138.6 million**	**Mt. Vernon Square Sub. –** Build new substation to relieve predicted network overloads.	June 2023	NoMa, Mt. Vernon Triangle, Shaw
2	**$191.7 million**	**Harvard Sub. –** Upgrade Harvard as a new 230/13 kV substation to retire existing Harvard and Champlain substations.	June 2024	Columbia Heights, Adams Morgan
3	**$234.82 million**	**Champlain Sub. –** Upgrade Champlain as a new 230/69 kV substation to resupply downtown distribution substations.	June 2029	Downtown

[15] In the 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (page 266 of the hearing transcript):
But what we were talking about here yesterday was that the comprehensive plan would include… any rebuilt substations you might have; any new substations you might have…
Moreover, Order No. 16975 states the following at paragraphs 50 and 101:
50. Decision: …Consequently, we require Pepco to include a report on substation additions and enhancements in future Consolidated Reports. In addition to the information provided in the 2012 Consolidated Report, the Commission requires that Pepco provide details concerning the justification for these projects, including, as applicable, load growth projections and equipment age and condition in future Consolidated Reports.
101. Pepco is DIRECTED to provide a report on substation additions and enhancements consistent with paragraph 50 herein;

Construct New Mt. Vernon Square Area Substation (2023 Load Relief Project)

Overview: This project consists of constructing a new 230/13 kV substation with an ultimate capacity of 210 MVA near Mt. Vernon Square. It is currently planned to initially have three 230/13 kV transformers for a firm capacity of 140 MVA. This substation will provide distribution capacity to the rapidly redeveloping area in and around the Mt. Vernon Triangle. Initially, approximately 57.0 MVA of load would be transferred from the Northeast Sub. 212 Southwest LVAC Network Group and Tenth Street Sub. 52 radial distribution in 2023.

Justification of Substation Additions and Enhancements

The new substation at Mt. Vernon Square is needed to provide capacity to the redeveloping Mt. Vernon Triangle and Shaw areas. The capacity improvements at the Harvard Substation are needed to replace aging infrastructure at the Harvard and Champlain Substations and to create capacity to serve the growing Columbia Heights area. The new upgraded substation at Champlain will be used to re-supply existing L Street, F Street, and Georgetown substations with new solid dielectric feeders. Pepco has also projected capacity constraints and, thus, a potential need for a load-driven substation in the 2029-2031 timeframe in the St. Elizabeth's and Columbian Quarter area of Ward 8. Future ACRs will discuss this project in more detail and as its load continues to develop.

Load Projections:

Facility: Northeast Sub. 212 Southwest LVAC Group

Summer Summer Rating = 50.0 MVA

	2021 History	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated	2031 Anticipated
Net Load Forecast (MVA)	37.6	43.1	44.7	45.5	48.1	50.0	51.9	53.8	55.7	57.6	59.5

Facility: Northeast Sub. 212

Summer Summer Rating = 214.0 MVA

	2021 History	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated	2031 Anticipated
Net Load Forecast (MVA)	153.6	159.1	169.5	180.0	191.2	192.9	194.8	196.5	198.4	200.0	201.9

Magnitude of Load: Initially, approximately 57.0 MVA of load would be transferred from the

Northeast Sub. 212 Southwest LVAC Network Group and Tenth Street Sub. 52 radial distribution in 2023.

Justification:_The new Mt. Vernon Substation will provide relief to the Northeast Sub. 212 Southwest LVAC Network Group, which is expected to reach 90% of its firm capacity in 2023 and reach 100% of its firm capacity in 2026. Northeast Sub. 212 is expected to be at 90% of its firm capacity by 2025. Two Sub. 212 Southwest LVAC Network feeders will experience an average overload of about 5% in 2023, 7% in 2024 and over 10% in 2025. Due to space limitations in the streets around the Northeast substation, no new feeder groups can be extended to relieve these overloads.

Long-term growth exceeding 140 MVA is expected to come into service in the Mt. Vernon Triangle, NoMa, and Capitol Crossing areas over the next 8 years. This currently includes over 15,000 apartment type residential units, 1,300 hotel rooms, 2.5 million square feet of retail space and 6.5 million square feet of office space.

Total Planned Capital Investment (Includes A & G): $138.6 million

Current Status: In Construction.

In-service Date: June 2023

Alternative: There were several alternatives provided by Pepco in Formal Case No. 1144, including to delay the construction of the facility until 2024. To facilitate this specific alternative, a series of cascading load transfers are required to relieve Northeast Sub. 212 using Florida Avenue Sub. 10. This alternative is not practical due to load proximity. The feeders being extended from Florida Avenue Sub. 10 will be less reliable due to length and would reduce area operating flexibility as Florida Avenue Sub. 10 and the other area substations will all be loaded near their full capacity.

Multiple sites were evaluated for locating the proposed Mt. Vernon Square Sub. An alternative substation location was investigated along New York Avenue in Northeast DC. It was determined that the primary amount of development and load center of the new substation was in the Mt. Vernon Triangle area. Several sites were investigated in the Mt. Vernon Triangle area, but alternatives were rejected as too expensive or not offering required access to the nearby streets.

Upgrade Harvard Sub. 13 (2024 Aging Infrastructure Project)

Overview: This project consists of removing the current 34kV/13kV substation at Harvard Sub. 13 and upgrading to a new 230/13kV substation with an ultimate Firm Capacity of 210 MVA. It will initially have three 230/13kV transformers resulting in a Firm Capacity of 140 MVA. The upgraded Harvard Sub. 13 will serve all 13kV load supplied from the existing Harvard Sub. 13 and will provide capacity to enable the transfer of load from Florida Avenue Sub. 10 and partial load from Champlain Sub. 25. The remaining load of Champlain Sub. 25 will be transferred to Florida Avenue Sub. 10, allowing for the transition of that facility from a distribution substation to a re-built sub transmission substation. The upgraded Harvard Sub. 13 will also provide capacity for future load growth in the Columbia Heights and Adams Morgan areas.

NOTE: Changes to the original plan for transferring all load of Champlain Sub. 25 to new Harvard Sub. 13 are due to feeder routing limitations discovered during field investigations.

Load Growth Projections:

Facility: Harvard Sub. 13

Summer Rating = 140.0 MVA

	2021 History	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated	2031 Anticipated
Net Load Forecast (MVA)	0.0	0.0	4.3	42.0	99.3	100.9	103.3	103.4	103.3	103.3	103.3

Magnitude of Load: All load supplied from the existing Harvard Sub. 13 was transferred temporarily to nearby substations in 2020. After the upgraded Harvard Sub. 13 is placed in service, partial load from Florida Avenue Sub. 10 and Champlain Sub. 25 will be transferred to it. The remaining load supplied from Champlain Sub. 25 will be transferred to Florida Avenue Sub. 10, allowing for the transition of Champlain from a distribution substation to a new subtransmission substation.

Identified Need: This project is needed to retire aging infrastructure including the Harvard Sub. 13 - 13 kV substation originally constructed in 1907, the 34 kV supplies to Harvard Sub. 13 from Buzzard Point Sta. “B”, constructed around 1960, and Champlain Sub. 25 13 kV substation, constructed around 1954. This upgraded substation will also supply capacity to the growing Columbia Heights and Adams Morgan areas.

Justification: Harvard Substation 13 was initially built in 1907 with the substation having undergone several refurbishments with the latest taking place in the mid-1960s. The 34kV supplies to Harvard Substation 13 were constructed in the 1940s. The last incarnation of Champlain Substation 25 was put into service in the mid-1950s although some portions of the site are likely older. The substation does not meet Pepco’s current standard for fault current withstand and are configured in a non-standard way that could lead to longer restoration times for failures experienced inside the substation. In addition, completion of this project along with the project to resupply “L” Street Sub. 21 (Downtown 34-69kV Resupply) and the retirements of Anacostia Sub. 8 and Navy Yard Sub. 33 will enable the retirement of Buzzard Point Sta. "B" 13/34 kV substation. The upgraded Harvard substation will provide capacity to accommodate projected load growth in the Columbia Heights area.

Total Planned Capital Investment (Includes A & G): $191.7 million (overall estimated cost of project increased due to inclusion of historic landmark nomination, demolition, and civil engineering costs).

Current Status: In design and construction stages

In-service Date: June 2024

Alternative: The alternative to rebuilding the Harvard Substation would require construction of a new 210 MVA, 138/34 kV substation near Buzzard Point, from which three (3) new 34 kV "radial" underground circuits would be extended approximately 5.3 miles to the Harvard Substation. All existing equipment would be upgraded at the Harvard Substation; however, the capacity of the substation would remain at 80 MVA. Upgrading the Harvard Substation would require replacement of individual transformers and switchgear. This alternative would cost more overall than the selected alternative and would not increase overall substation capacity as much as the selected alternative. Pepco currently does not have adequate substation capacity in the area to transfer the entire load from the Harvard and Champlain Substations to other substations.

Upgrade Champlain Sub. 25 to 230/69 kV substation (2027 Aging Infrastructure Project)

Overview: This project consists of removing the current 69kV/13kV substation at Champlain Sub. 25 and upgrading to a new 230kV/69kV substation with an ultimate capacity of approximately 570 MVA. It will have three 230kV/69kV transformers with room for a fourth 230kV/69kV transformer. From the upgraded Champlain Sub. 25, four new 69 kV supplies will be extended to serve "F" Street Sub. 74 and Georgetown Sub. 12. The supply feeder replacements for "F" Street Sub. 74 and Georgetown Sub. 12 are recommended so the existing, aged, fluid self-contained 69 kV supplies from Potomac River Sta. "C" can be retired. These feeders have had increasing maintenance issues over the past several years. The new 69kV supply feeders to "L" Street Sub. 21 from Champlain are recommended to retire the existing 34kV feeders from Buzzard Point which restrict the Firm Capacity at "L" Street Sub. 21.

Load Growth Projections:

Facility: F St. Sub. 74

Summer Rating = 82.0 MVA (old)/210.0 MVA (new)

	2021 History	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated	2031 Anticipated

Facility: L St. Sub. 21

Summer Rating = 62.0 MVA (old)/100.0 MVA (new)

	2021 History	2022 Anticipated	2023 Anticipated	2024 Anticipated	2025 Anticipated	2026 Anticipated	2027 Anticipated	2028 Anticipated	2029 Anticipated	2030 Anticipated	2031 Anticipated
Net Load Forecast (MVA)	40.3	34.7	34.6	34.8	34.7	72.3	72.2	72.5	72.3	35.8	35.9

Magnitude of Load:_Approximately 166 MVA of load will be served from the upgraded Champlain Sub. 25 as the existing "F" Street Sub. 74, Georgetown Sub. 12 and "L" Street Sub. 21 will all be supplied from new 69 kV feeders extended from Champlain.

Identified Need:_This project is needed to retire aging 69 kV supply feeders to Georgetown Sub. 12 and " F" Street Sub. 74 and the aging 34 kV supply feeders to "L" Street Sub. 21.

Justification: The last incarnation of the Champlain Substation was put into service in the mid-1950's, although some portions of the site are older. Further, many of the Champlain Substation's air circuit breakers were installed in 1960 and 1976. While Pepco's inspections have found that this equipment is in good condition due to Pepco's ongoing maintenance programs, it is all operating well beyond its recommended lifespans. In addition, the feeders are all over thirty years old. The 69 kV supply feeders are "self-contained" type cables, meaning that there is fluid contained inside the cable jacket for cooling purposes. There have been an increasing number of maintenance problems with this cable which require extended time and resources to resolve due to limited material availability and few contractors with expertise repairing this type of cable system. This increases customer outage risk as the feeder needs to be taken out of service for extended periods of time while repairs are made.

The new 69 kV supplies to "L" Street Sub. 21 will replace the solid dielectric and gas filled cables that are at least 30 years old. In addition, resupplying "L" Street Sub. 21will allow for the retirement of the Buzzard Point Sta. "B" 13kV and 34kV substations, the former of which was originally built in the 1930's as a generating station. Another benefit of replacing the feeders is that the firm capacity at "L" Street Sub. 21 will significantly increase.

Total Planned Capital Investment (Includes A & G):_$234.81 million. The increase in cost is due to the inclusion of costs associated with Takoma Sub. 500 MVA phase shifters.

Current Status: In the early design stages.

In-service Date: June 2029.

Alternative: The alternative to rebuilding the Champlain Substation would require replacing the three existing 69 kV supply feeders from the Takoma Substation (5.4 miles) to Champlain Substation. The Champlain Substation would still need to be rebuilt, and, in addition, Pepco would need to build a new downtown substation. The new downtown substation would require the purchase of additional land. A new downtown substation would require extending three 230 kV "radial" underground circuits a total of approximately 5.0 miles from the Takoma Substation to the new downtown substation.

1.13 Distribution Projects[16][17]

Overhead and Underground Distribution Projects[18]

Pepco's overhead and underground distribution project budgets over the past eight years are provided in Table 9.

Table 9: Historical Routine Overhead and Underground Projects

Pepco DC 2014 - 2021 Capital Budgets (Dollars in Millions)								
Distribution	**2014**	**2015**	**2016**	**2017**	**2018**	**2019**	**2020**	**2021**
Customer Driven	53.0	55.4	67.2	68.7	71.3	85.4	89.3	80.7
Reliability	133.7	127.5	121.2	114.8	157.6	176.0	197.8	212.1
Load	36.4	51.8	45.0	20.4	71.9	62.9	71.9	60.3
TOTAL	223.1	234.7	233.4	203.9	300.8	324.3	359.0	353.1

Pepco's overhead and underground distribution project budgets for the next five years are provided in Table 10. In developing forecasts, system planners review each component of the existing electric system, along with requirements for new service hook-ups, to develop the costs and schedules for changes to the

[16] In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (pages 266-267 of the hearing transcript):
But what we were talking about here yesterday was that the comprehensive plan would include… anything that you might envision to account for distribution load growth…
[17] Order No. 16975 states the following at paragraphs 51, 52 and 102:
51. Staff Recommendation #7: Continue to provide annual updates of on-going and planned OH and UG distribution projects driven by customer, reliability, and load considerations in future Consolidated Reports. Include budget as well as actual spending for each of the three categories and explanation of significant differences in actual versus budgeted amounts…
85. Decision: The Commission adopts recommendation #7, noting that Section 1.2.4 of the Consolidated Report does not contain a comparison of actual vs. budgeted spending, nor does it include an explanation of any variances. Pepco is therefore directed to include this information in future Consolidated Reports. 102.Pepco is DIRECTED to continue providing updates of on-going and planned overhead and underground distribution projects consistent with paragraph 52 herein;
[18] In Order No. 12735 issued on May 16, 2003, the Commission stated the following at paragraphs 74 and 135:
74. During the November 2001 hearings the Commission requested that PEPCO submit a comprehensive plan to include a current assessment of, and future plans for, its underground distribution and network facilities.179 The Commission requested the plan as a tool to evaluate PEPCO's planning methodology and to assess PEPCO's ability to anticipate and respond to changing conditions in its underground distribution system…

135.PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:
(c) Listing of underground distribution projects, such as the Adams-Morgan neighborhood project (including budgets, time schedules, and expected benefits) by secondary vs. primary system by District of Columbia wards affected, but not specific locations;
The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

electric system. Results are then proposed as candidates for inclusion in the construction budget process, which takes place during the second half of each year. The construction budget process culminates with the approval of the following year's budget and the selection of projects to be included in the budget and four-year forecast of electric system additions. Projects may be added or deleted from the budget and four-year forecast from year to year as required. The summary budget and four-year forecast for overhead and underground distribution projects, which identifies types of projects and their respective budgets and forecasts for the years 2022 through 2026 is provided as Table 10.

Table 10: Planned Overhead and Underground Distribution Projects

Pepco DC 2022 - 2026 Capital Budgets (Dollars in Millions)					
Distribution Construction	**2022**	**2023**	**2024**	**2025**	**2026**
Customer Driven	76.8	87.3	83.0	82.5	72.1
Load	81.0	52.9	58.9	47.4	46.2
Reliability	199.9	209.0	248.4	241.4	266.7
Total	**357.7**	**349.2**	**390.3**	**371.3**	**385.0**

Note: Pepco prepares a five-year budget. Potential emergency restoration work is included in the Reliability budget and forecast. Prospective work for the DC PLUG initiative has been included in this plan.

Pepco's overhead and underground distribution project variances for 2021 are provided here in Table 11, in accordance with Order No. 18644.

Table 11 Routine Overhead and Underground Distribution Project Variances

Pepco DC 2021 Capital Budget Variances (Dollars in Millions)			
Distribution Construction	**2021 Budget**	**2021 Actual**	**Variance**
Customer Driven	80.7	78.6	(2.1)
Load	60.3	32.2	(28.1)
Reliability	212.1	204.9	(7.2)
TOTAL	353.1	315.6	(37.4)

MAINTAINING SYSTEM RELIABILITY

Pepco is committed to maintaining a safe and reliable electric distribution system and has programs in place that advance the operation of the electric distribution system by increasing the capabilities to monitor and analyze the performance of its system and enhance the ability to determine where to make modifications and additions to replace poorly performing equipment. Pepco monitors the performance of its distribution feeders system wide. This process is performed annually and enables Pepco to analyze and determine the relative ranking of each feeder's performance from the least to the most reliable.

This section of the Consolidated Report addresses:

- Technology: Monitoring, Automation, and Information Systems;
- Equipment Standards and Inspections;
- Vegetation Management (VM) Program Detail;
- Industry Comparisons;
- Best Practices; and
- Storm Readiness.

Systems and Technology: Monitoring, Automation, and Information Systems[19]

The discussion below addresses the Company's technology initiatives that contribute to improved reliability performance.

SCADA[20]

The System Control and Data Acquisition (SCADA) System is the primary tool used by the System Operators to monitor and operate the electric system. This system provides the System Operator at the Control Center the ability to remotely monitor and operate all major equipment at all substations and selected equipment outside of the substations. It is through this system that the System Operator learns what is happening across the electric system and can take appropriate actions to maintain a safe and reliable system and restore service during outages.

The Remote Terminal Unit (RTU) at each substation gathers data from all substation monitored equipment and provides an interface to pass the data to the central computer system, Energy Management System (EMS), and to the System Operator, who can then remotely control devices at each substation. Major equipment status (open or closed) and equipment metering (watt, var, voltage and ampere) is monitored by the Operator. Additionally, there are specific equipment alarms that indicate abnormal conditions like high temperature, low oil pressure or overloads on a particular device or feeder.

Pepco maintains its own extensive communication system that allows for direct communication between the RTUs at the substations and the computer system at the Control Center.

The computer system at the Control Center gathers the data from all the RTUs, analyzes the data, displays results to the System Operators, and provides the interface for the System Operator to

[19] In Order No. 12804 paragraph 53 E, the Commission ordered the following:
53. The 2003 PIP is hereby APPROVED, provided that PEPCO:
(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.
[20] The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001, at page 313.

remotely operate the system to protect equipment. Any change of electric system status at the substation is displayed to the System Operator within approximately 4 seconds. The system also provides various analyses. For example, it provides an indication if any substation equipment exceeds its capability limits. It does this by comparing the design limit of the equipment with the present loading. Through the SCADA system automatic switching activities can be performed or the System Operator can act manually to protect remote system equipment and relieve the condition that caused the equipment to be operating outside of its limits.

All raw data from the SCADA system (meter values and status changes) are retained and made available to those areas (System Planning, Distribution and Engineering, etc.) that need the data for analysis. The available data consists of meter values (watts, vars, volts and amps) and status (open and closed) of various facilities, equipment and feeders.

Substation Automation[21]

Although all 13 kV substations have full SCADA control, some 4 kV substations have only limited monitoring capability and do not have the full RTU capability that provides remote control and operation. At these substations all equipment status indications are grouped together on a substation basis and when there is a change of status, a single alarm point provides a single substation alarm indication. Personnel are dispatched to the substation to determine the specific problem. A project is underway to install full RTU capability in the Company's 4 kV substations that are not scheduled for conversion and retirement by installing smart relays on all critical equipment. This will provide for improved restoration capability and hourly data for analyses.

The following is the schedule for substation automation as currently planned:

- Macarthur Boulevard Sub. 152 (Q4 2022)
- Texas Ave Sub. 111 (Q2 2023)
- Fort Dupont Sub. 58 (Q2 2024)
- Fort Davis Sub. 100 (Q2 2025)

[21] Substation Automation and the following section, Distribution Automation, are also addressed in Sections 1.13, respectively, as PIP Projects.

In addition, conventional electro-mechanical relays are being replaced with new generation Smart Relays. Additional information provided by these relays is allowing for more effective and efficient operation. In certain applications, the smart relays can provide information with respect to the distance from the substation to the fault on the feeder. This will allow for faster troubleshooting of system problems, improved restoration capability and increased data for system analyses.

Distribution Automation (DA)

As part of the DA projects, eighteen 13 kV substations have been equipped with upgraded Smart Relays and enhanced RTUs for improved visibility and control at these locations. Additional information provided by these relays will allow for more effective and efficient operation and will support the operation of the Automatic Sectionalizing and Restoration (ASR) system being installed at each location. The following eighteen13kV substations, which supply load within the District of Columbia, have been equipped with enhanced RTUs and upgraded Smart Relays:

- 12th & Irving Substation
- Alabama Ave Substation
- Benning Substation
- Fort Slocum Substation
- Harrison Substation
- Little Falls Substation
- NRL Substation
- Van Ness Substation
- Beech Rd Substation (located in MD but serves some DC customers)
- Bladensburg Substation (located in MD but serves some DC customers)
- Grant Ave Substation (located in MD but serves some DC customers)
- Green Meadows Substation (located in MD but serves some DC customers)
- St. Barnabas Substation (located in MD but serves some DC customers)
- Takoma Substation (located in MD but serves some DC customers)
- Tuxedo Substation (located in MD but serves some DC customers)
- Walker Mill Substation (located in MD but serves some DC customers)
- Linden (located in MD but serves some DC customers)
- Wood Acres (located in MD but serves some DC customers)

Projects are underway to install additional 13 kV and 69 kV remotely operated switches on feeders in addition to the feeders associated with the ASR systems. The additional switches will allow more capability to isolate the faulted portion of the feeder and return more customers to service sooner. The remote-control capability of these switches allows the System Operator to perform switching without the need for field crews, thus reducing customer outage time.

Pepco has completed the installation, testing and integration of the network transformer remote monitoring system (RMS) in the following network groups. Buzzard SE, Buzzard W, Sub 161 South, Sub 18 Central, Sub 2 North, Sub 212 South, Sub 212 Southeast, Sub 25 Central, Sub 52 South, Sub 52 West, Sub 6 North, and Sub 7 Central.

These monitors will provide increased visibility and control capability for system operators to remotely open or close the network transformer protectors through two-way communications. Load, voltage, protector status, and equipment condition data are recorded for study and operating purposes, and for increased ability to schedule maintenance of this equipment. RMS will provide operational data to evaluate the performance of the transformer and protector, allowing Pepco to perform maintenance when needed and not just on an interval-based inspection schedule, and allow remote operation of the protector to disconnect network load from the transformer without the need to wait for a crew to manually operate the protector. This will provide great benefits during emergencies when there is a need to isolate a transformer very quickly from the network. The development of the RMS system and the initial installation at Buzzard Point were part of the Department of Energy Smart Grid Investment Grant (SGIG) that the Company received. The installations of RMS on these networks are part of the Company's long-term plan to install RMS in all its 49 networks, which contain approximately 4,000 transformers.

Outage Management System (OMS)[22]

The OMS is the primary tool used to receive customer trouble reports, analyze reports, and provide summary reports for crew dispatching. Typically, the process starts with the customer reporting an outage by calling the Pepco Call Center or from an Advanced Metering Infrastructure (AMI) meter reporting the loss of power. Information from that call or meter report is entered into the OMS system. The OMS database has the customer information, including customer phone number, address, and connected transformer. Additionally, the database contains the electrical network configuration of each feeder connecting each transformer to a feeder and the location of switches, fuses and taps. The system then analyzes all reported trouble by sorting the reports, prioritizing and grouping multiple problems to a

[22] In Order No. 13422 on the 2004 Consolidated Report, paragraph 66, the Commission ordered the following:
66. The 2004 Consolidated Report: Productivity Improvement Plan and Comprehensive Plan is hereby APPROVED, provided that PEPCO:
(a) Report in the 2005 Consolidated Report, due February 15, 2005, on the corrective actions taken to fix the OMS;

common source. The analyzed data are then displayed to the System Operator for dispatch of crews to investigate and resolve the problem.

The SCADA system also provides input to the OMS. When a feeder breaker at a substation opens and the entire feeder is out, all customers connected to that feeder are known to be out of service. Information obtained from customers (pole struck, line down, tree limb on wire, etc.) in the OMS is then used to determine the source of the problem and to dispatch crews. For trouble involving these pieces of equipment, the customer trouble calls provide the data necessary to determine the problem. The OMS analyzes all the customer calls as well as AMI meter statuses and then determines the common source of the problem. Information is also passed back through the OMS to the Call Center to provide that information to the customer when they call in or review their account online. This information includes knowledge of current trouble and estimated restoration time under non-major storm outage conditions. No significant changes or additions were made to Pepco's OMS system in 2021.

1.14 Information Systems

Asset Suite 8

AS8 is the system used for construction, engineering, scheduled preventative maintenance and corrective work management at Pepco. Asset data is also maintained in the system. It is closely integrated with the Graphical Work Design (GWD) system and two new scheduling systems, Primavera P6 and Syntempo. AS8 replaced Pepco legacy systems WMIS and SAP in early 2019. They are still available in read-only mode for reference.

Primavera P6

Primavera P6 is the primary tool for T-Week scheduling for construction, engineering, and plant maintenance (preventative and corrective) work at Pepco and is closely integrated with the Asset Suite 8 and Syntempo systems.

Syntempo

Syntempo is the primary tool for underground New Business work at Pepco and is closely integrated with the Asset Suite 8 and Primavera P6 systems.

GIS/GWD System

Pepco continues to deploy new functions offered by the GIS vendor for greater use of GIS data throughout the company, primarily in the area of data visualization and easier access to GIS data across the organization. The GIS/GWD system continues to be Pepco's official database of field assets. The Exelon utilities are discussing and evaluating the roadmap for GIS technologies among each company in the coming years.

1.15 Power Delivery Information System Projects[23]

Pepco's Power Delivery Information System Projects are provided in Table 12. Included in Table 12 are historical information system projects for the years 2016 - 2021. All costs are for those allocated to the District of Columbia.

Table 12 Historical Information System Projects

Rollup-1	Estimated DC Portion 2016	Estimated DC Portion 2017	Estimated DC Portion 2018	Estimated DC Portion 2019	Estimated DC Portion 2020	Estimated DC Portion 2021
ROLLUP ($000s)						
Customer Systems	782	2,295	10,634	4,544	5,734	
Smart Grid Systems	514	585	1,594	1,792	1,561

Engineering Systems	260	33	38	422	680	
Field technologies	0	133	0	0	0	
Work Management	315	1,763	7,233	2,951	3,626	
Planning and Performance	0	80	255	548	1,214	
Subtotal IT Capital (DC Portion)	**3,312**	**6,886**	**22,925**	**12,701**	**17,855**	

Note: List does not include Smart Grid meters, Smart Grid communication network, distribution automation, or Telecom.

[23] In Order No. 12735, paragraph 139, the Commission ordered the following:
PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:…
(d) Listing of power delivery information system projects with implementation schedules, annual costs, and milestones;
(e) Listing of new technology investigations with decisions, annual costs, and implementation schedules;
…The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

1.16 Equipment Standards & Inspections

Equipment Inspections[24]

A proactive inspection and monitoring program reduces the possibility of unexpected failures and secondary damage to surrounding units and increases the opportunities that Pepco can plan for the replacement of impending problem equipment. The frequency of inspections and monitoring is based on Pepco's experience, manufacturers' recommendations, and/or industry practices. Inspections may lead to repair or replacement of transmission and distribution system components to maintain safety and reliability of the system.

Inspection and modeling activities identify equipment to be replaced due to loading or condition. Distribution line equipment such as transformers, cable, and other components are not subject to detailed electrical testing and are replaced only when physical inspection indicates a need for replacement. Other than those inspections, equipment is replaced when it is upgraded, relocated or fails.

As new technologies are installed, actual operational data will be available to better analyze the loading and performance of equipment. For example, load data from the AMI system can potentially identify overloaded transformers prior to failure.

Table 13 below provides a range of inspection or maintenance cycles for different classes of equipment. These were developed by weighing factors such as criticality, duty cycle, varying manufacturer's recommendations, and technological differences.

The equipment types and asset groups listed on Table 13 have been designated as either a "preventive" or a "predictive" maintenance. It should be noted that Pepco views its overall maintenance methodology to be defined by "reliability-centered" practices, with predictive and preventive methodologies to be subsets of this reliability-centered focus.

[24] In Order No. 16091, paragraphs 63 and 46, the Commission ordered the following:
63. Pepco is directed to provide a description of its maintenance policies and methodologies, consistent with paragraph 46 of this Order;
46. Decision. … we shall require that Pepco provide a list of the types of equipment for which a "run to failure" method applies and those for which a preventive method applies. (Footnote: If other maintenance methods are used, Pepco shall describe them as well.) The Commission requires that Pepco provide an explanation of why different maintenance methods apply to different types of equipment. We also require a description of the "test procedures" that Pepco uses to assess the performance and remaining life of the equipment. (Footnote: See Pepco comments at 7.) Further, Pepco shall provide an estimate of the current book value of equipment maintained under each method used by Pepco. The 2011 Consolidated Report shall include this description of maintenance policies and methods.\

Table 13: Equipment Inspections

Equipment	Inspection	Periodicity	Maintenance
Substation	**General Inspection**	**Every 2 months**	**Preventive**
Substation Power Transformers	Predictive Maintenance Routine	Annually	Predictive
	Oil Collection and Analysis of Transformer Main Tank and Load Tap Changer (LTC)	Once a year or more frequently if triggered by the Equipment Condition Assessment (ECA) Process, or criticality of transformer	Preventive
	Routine Inspection and Test	Every 4, 8, or 16 years based on criticality, or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
	LTC Filter Change	Where applicable and condition- based maintenance on high filter differential pressure	Preventive
	Routine Cooler Inspection	Annually	Preventive
Substation Capacitor Banks - Metal Enclosed	Routine Inspection	Annually or more frequently as recommended by Equipment Condition Assessment Process	Preventive
Substation Capacitor Banks - Open Rack	Routine Inspection	Annually or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
Substation Capacitor Banks - Open Rack with Circuit Switcher	Routine Inspection	Annually or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
Substation Circuit Breakers – Air Magnetic	Predictive Maintenance (PDM) Tasks	Annually	Predictive
	Routine Test	6 Years or more frequently as recommended by Equipment Condition Assessment Process.	Preventive
	Oil Collection and Analysis Of OCB	Every 1, 2 or 3 years based on criticality, or more frequently as recommended by Equipment Condition Assessment	Predictive

Equipment	Inspection	Periodicity	Maintenance Methodology
Substation Circuit Breakers – Air Magnetic	Predictive Maintenance (PDM) Inspections	Annually	Predictive
	Internal Inspection and Test	3 – 4 Years, or more frequently as recommended by Equipment Condition Assessment Process	Preventative
	Diagnostic Testing	3 Years	Preventative
	Compressor Inspection/Pre-Charge	2 Years	Preventative

Equipment	Inspection	Periodicity	Maintenance Methodology
	Inspection (as applicable)		
Substation Circuit Breakers – SF6	Predictive Maintenance (PDM) Inspections – Non-Intrusive	Annually	Preventative
	Routine Inspection – Intrusive	Single Pressure: 8 Years, Dual Pressure: 4 Years, or more frequently as recommended by Equipment Condition Assessment	Preventative
	Diagnostic Testing	Single Pressure: 8 Years, Dual Pressure: 4 Years, or more frequently as recommended by Equipment Condition Assessment Process	Preventive
Substation Circuit Breakers – Vacuum	Predictive Maintenance (PDM)	Annually	Predictive
	Routine Inspection	6 Years or more frequently as recommended by Equipment Condition Assessment Process	Preventive
Substation – 69 to 230kV High-Pressure Pipe-Type Potheads	Periodic Inspections where sample ports are available.	Every 4 to 6 years (230kV),	Preventive
	Periodic Inspections where sample ports are available.	Every 6 to 8 years (115kV),	Preventive
	Periodic Inspections where sample ports are available.	Every 8 to 10 years (69kV)	Preventive
Substation – Battery & Charger Systems	Visual & On-line Test/Inspection	Annually or more frequent as recommended based on an ECA.	Preventive
Substation – Building Heating, Ventilation and Air Conditioning (HVAC) System	Annual Inspection	Annually	Preventative
Substation – Emergency Generators	Start and Run Test	Up to 4 times per year: Routine Inspections; Annually: Standby Generator Inspection and Maintenance and Black Start Generator Test Inspections as recommended based on equipment condition.	Preventative

Equipment	Inspection	Periodicity	Maintenance Methodology
Substation – Fire Protection Pump	Routine Inspection	Annually	Preventive
Right-of-Way Integrated VM (Transmission)	Routine Inspection	Interval based on Right-of-Way inspections and height of vegetation.	Preventive
Scheduled Tree Trimming - Overhead Distribution Feeders Not In Transmission Rights- of-Way	Routine and Condition-based Tree Inspection	2 Year trim cycle	Preventive
Protective Relays and Automatic Reclosing Relays	Preventive Maintenance	4 to 8 years based on system voltage class	Preventive
Under-Frequency Relays	Preventive Maintenance	8 years	Preventive
RTUs - SCADA	Predictive Maintenance	Failure to operate properly based on condition monitoring – self diagnostics, EMS trouble logs, real	Predictive
SCADA (Supervisory Control and Data Acquisition) Metering	Preventive Maintenance	Condition based maintenance	Preventive
Digital Fault Recorder	Preventive Maintenance	200kV and Above: 8 Years, Below 200kV: Failure to operate properly based on condition monitoring-self diagnostics, fault records, real time data analysis and remote communications.	Preventive
Power Line Carrier (PLC)	Preventive Maintenance	Every 24 Months	Preventive
Microwave Equipment	Preventive Maintenance	Every 24 Months	Preventive
Fiber Optic Equipment	Preventive Maintenance	Condition Based Maintenance	Preventive
Leased Line	Preventive Maintenance	Every 24 Months	Preventive
Pole-Type Recloser	Routine Inspection	Visual: 2 years Operational Test: Every 3 to 6 yrs.	Preventive
Pole-Type Regulators	Routine Inspection/Test	Every 24 months	Preventive
Critical (Hospital/Nursing Home) Network Transformers/Protectors	Routine Inspection	Every 3 years	Preventive
Distribution Manholes	Routine Inspection	Every 6 years	Preventive

Equipment	Inspection	Periodicity	Maintenance Methodology
Underground Network Transformers/Protectors	Routine Long Inspection	Every 5 years de-energized (Staggered w/Short Inspection so visits are 2.5 years apart). Inspection cycle for some locations may differ and be between 2 - 10 years based on: 1) criticality - hospital locations are inspected more frequently; 2) location type - sidewalk/roadway location or roof top/basement; and 3) installation type - junction	Preventive
Capacitor Banks – Pole Mounted	Routine Inspection	2 Years for Non-Distribution VAR Dispatch (DVD), DVD capacitors monitored near real-time.	Preventive
Distribution Pad mounted Transformers / Switchgear	Routine Inspection	5 Years	Preventive
Pipe-Type Cable Joint Sleeves in Manholes	Periodic Inspection	Every 5 to 10 years	Preventive
Wood Poles	Wood Pole Inspection, Remedial Treatment and Restoration	Every 10 years (starting in 2015)	Preventive
Power Line Over Navigable Waterway – Overhead Clearance	Routine Inspection	5 years	Preventive
High Voltage Transmission Structure Aviation Warning	Periodic Inspection	Annually	Preventive
High Voltage Transmission Structure Grounding	Periodic Inspection	Inspect Grounding System on a 5 – 10- y e a r interval	Preventive
Microwave Tower and Aviation Warning Lighting	Periodic Inspection	Annual or as per Federal Aviation Administration (FAA)	Preventive
High Voltage Transmission Line Comprehensive Inspection	Aerial Inspection	6 Years	Preventive
Cathodic Protection	Substation Inspection and Manhole Survey	Condition based – Various intervals (based upon type of work involved)	Preventive
Cable Oil and Gas Alarms	Annual Inspection	Annually	Preventive
Fluid Pressurizing Plants for High-Pressure Pipe-Type Cables	Operational Test and Inspection	Every 1 to 2 weeks (chart replacement), Every 1 to 2 years (operational test)	Preventive

Table 14 includes the book value of equipment as of December 31, 2021. Book values have been categorized by direct and allocable plant. The use of FERC Mass Asset Accounting does not allow any specific asset to be identified and linked to its accumulated depreciation and remaining useful life or to link it to the maintenance method applied to the equipment as assets are depreciated by account. Any specific asset to be identified and linked to its accumulated depreciation and remaining useful life or to link it to the maintenance method applied to the equipment as assets are depreciated by account.

1.17 Overhead Feeder Inspection Program [25]

Pepco's Overhead Feeder Inspection Program was initiated in 2012 to improve overall system reliability and remediate potential safety issues. In the years since the initial inception, the Overhead Feeder Inspection Program has been refined to facilitate more aggressive inspection timelines and prioritization for remediation activities that addresses the criticality of infrastructure issues and is consistent with typical feeder improvement work.

Overhead Feeder Inspection Cycle

Pepco's Overhead Feeder Inspection Program ensures that all feeders with overhead exposure are inspected within a two-year period. Pepco currently has approximately 200 District of Columbia feeders with overhead exposure.

Overhead Feeder Inspection Components

The overhead feeder inspection consists of a mobile scan of all main line poles on a feeder, from ground line to the top of the pole, including the conductors from pole to pole, utilizing Ultrasonic and Infrared Non-Destructive Testing (NDT) methodology.

Visual inspection is performed on all feeder mainlines to determine feeder/equipment condition and identify immediate threats to reliability created on the following equipment:

- Cross-arms and braces
- Insulators
- Grounds
- Lightning arrestors
- Conductors
- Transformers
- Reclosers
- Capacitors
- Regulators
- Ancillary equipment
- Vegetation

[25] Order No. 16975 states the following at paragraphs 64 and 107:
64. Decision: Pepco is directed to report on the Overhead Feeder Inspection Program in future Consolidated Reports as recommended by OPC and the Staff, including results of the inspections, actual and incipient failures detected and remediation actions taken to correct the nonconformance items recorded. In particular, as requested by OPC, Pepco is directed to report on replacement of lightning arresters.
107.Pepco is DIRECTED to report on the Overhead Feeder Inspection Program consistent with paragraph 64 herein;

Overhead Feeder Inspection Results

Overhead feeder inspection results required remediation work and completion status are tracked. Prioritization of remedial work is based on both safety and reliability attributes. Immediate or near-term response is assigned to those conditions that must be addressed to mitigate imminent safety or reliability issues. Less emergent conditions are required to be remediated within the typical design and build cycle for distribution projects. Conditions that do not pose a reliability or safety threat in neither the near-term nor long-term, are identified for possible upgrade in conjunction with other planned work.

Repairs or upgrades to correct or eliminate conditions observed during inspections are scheduled under the following guidelines.[26]

- Priority 10: A condition where upon inspection, a Pepco facility is deemed to present an imminent safety hazard to utility personnel and/or the public. In this case, steps shall be taken to immediately eliminate the hazard. Inspectors are required to immediately notify Pepco and to stand by until relieved by Pepco personnel.
- Priority 20: A condition where upon inspection, a component of an overhead feeder is observed and confirmed to pose a threat to service reliability but does not pose a direct public safety threat. Conditions under this category should be remediated within 90 days.
- Priority 30: A condition where damage or degradation exists on a component of an overhead feeder line, does not pose a direct public safety threat, and if left uncorrected, has the potential to affect service reliability under adverse system conditions. Conditions under this category should be remediated within 18 months.
- Priority 40: A condition that poses no threat to safety or reliability but does not conform to current Pepco standards. Conditions under this category should be corrected when other work presents the opportunity to bring the condition to current standards.

[26] See APPENDIX 3B - MANHOLE INSPECTION PROGRAM (MIP) for a details of Exelon Utilities Corrective Maintenance Prioritization system.

Overhead Feeder Inspection Cycle:

Pepco inspects approximately half of its overhead feeders every other year resulting in a full inspection cycle being completed every two years.

Overhead Feeders Inspected in 2021

In 2021, 103 District of Columbia feeders were inspected, and there were 48 conditions identified (listed below).

Table 15: Feeders Inspected in 2021

Feeder	Condition
63	Broken Cross Arm Braces (x2)
63	Cracked Cross Arm
152	Broken Cross Arm Brace
152	Split/Decayed Pole Top
164	Cracked Cross Arm
164	Missing Pole Tag
165	Broken Cross Arm Brace (x4)
244	Floating Primary Wire
348	Cracked Cross Arm
494	Blown Arrestor (x2)
494	Damaged Fuse
496	Broken Fuse
14005	Broken Cross Arm
14005	Broken Cross Arm Brace
14005	Missing Pole Tag
14005	Missing Pole Tag
14008	Loose Insulator
14008	Split Cross Arm (Major)
14009	Broken Tie Wire
14014	Broken Cross Arm Braces (x2)

Feeder	Condition
14016	Split Cross Arm (Minor)
14017	Cracked Cross Arm
14017	Floating Primary Wire
14017	Split Cross Arm (Major)
14017	Wooden Dead-End Insulator x2
14020	Broken Cross Arm Braces (x2)
14020	Cracked Cross Arm
14020	Leaning/Bent Cross Arm
14021	Leaning Insulator
14021	Split Cross Arm - Minor
14022	Broken Tie Wire
14022	Loose Tie Wire
14767	Frayed Primary Wire (x2)
14767	Missing Pole Tag
14806	Broken Cross Arm Braces (x2)
14806	Floating Primary Wire
14809	Broken Cross Arm Brace
14891	Decayed Cross Arm
15018	Broken Cross Arm Braces (x2)
15018	Decayed Cross Arm
15018	Leaning/Bent Cross Arm
15018	Missing Pole Tag
15166	Broken Cross Arm Brace
15166	Leaning/Bent Cross Arm
15168	Insulator - Damaged/Flashed
15949	Split Cross Arm - Minor
15950	Broken Cross Arm Braces (x2)
15950	Leaning/Bent Cross Arm

All conditions summarized in the table above were referred to the appropriate engineering area for further evaluation and remediation and have been remediated.

1.18 Overhead Feeder Inspection Schedule

The following Overhead Feeder Inspection Schedule is projected for the District of Columbia to ensure that all feeders will be inspected over the next two years. Figures 4 and 5 below.

Figure 4: 2022 Overhead Feeder Inspection Schedule

1.19 Vegetation Management Program Detail

Each year, Pepco's system reliability is impacted by trees and tree branches that have contacted, fallen on, or otherwise interfered with poles and wires, causing disruption of service. Due to the density of tree coverage in Pepco's District of Columbia service territory and public concerns relative to tree pruning, challenges exist when balancing the value of trees to customers and communities and the need for reliable electric service. The main objectives that the Vegetation Management (VM) program attempts to balance are safety, reliability, regulatory compliance, environmental stewardship, and customer satisfaction. Pepco's VM program includes tree pruning, tree removal, maintaining access and tree planting.

Pepco's VM priorities are:

- Achieving and maintaining a high degree of reliability across the entire electric system;
- Targeting areas of the electric system found to be most susceptible to outages and damage from trees;
- Performing cyclical pruning to maintain the stability of the system;

Working with local stakeholders and property owners in the removal of hazard trees in close proximity to Pepco's electric lines;

- Communicating with customers through various media;
- Performing emergency tree and limb removal from electric lines; and
- Assuring that the VM work is performed consistently with good environmental stewardship.

Pepco's VM program in the District of Columbia includes:

- Scheduled two-year cyclical maintenance or routine scheduled pruning and removals;
- Planting of trees to mitigate the impact of VM work;
- Unscheduled (non-cycle) maintenance operations; and
- Selective application of herbicide.

Pepco's VM process can be summarized in the following steps:

- Establish an annual VM plan strategy in accordance with regulatory requirements, International Society of Arboriculture (ISA) Best Management Practices and Pepco VM goals;
- Plan Work – Inspect the feeder to develop a VM work plan that defines the work to be performed;
- Prune/Remove/Clear Trees – VM personnel engage qualified contractors and perform project management and contract administration to complete feeder maintenance as planned;
- Validate completion of work plan – Certified Arborist inspects to validate that work performed is completed in accordance with plan and American National Standards Institute (ANSI) standards; and
- Document and report progress.

Scheduled Pruning

Pepco's scheduled cycle tree maintenance program in the District of Columbia includes a comprehensive inspection by an ISA Certified Arborist to develop a work plan for each feeder on a two-year cycle in accordance with guidelines established in conjunction with the District of Columbia's Urban Forestry Administration (UFA) and American National Standards Institute (ANSI) standards, and International Society of Arboriculture (ISA) Best Management Practices (BMPs).

Coordination with: DC Urban Forestry Administration (UFA) and others

The UFA is responsible for the management of most public space trees that grow in proximity to Pepco overhead facilities. UFA also administers the tree protection laws and is responsible for issuing permits for tree removal on private property. Arborists from Pepco and UFA work to identify and eliminate hazardous tree conditions during cycle and unscheduled maintenance operations. Pepco also coordinates with natural resource managers from the National Park Service, the District of Columbia Department of Parks and Recreation, and private property owners.

Despite the good working relationship between Pepco and UFA, challenges remain, especially with respect to VM work associated with "legacy" trees. District of Columbia statutes and regulations from decades ago resulted in "legacy trees" that impact operations today and have historically limited the degree and technique of vegetation cutback from Pepco power lines. This has resulted in large trees growing through and near conductors. Examples of the policies include the following:

1. Section 13 of "An Act for the Preservation of the Public Peace and the Protection of Property within the District of Columbia," approved July 29, 1892. (27 Stat. 324; District of Columbia Official Code § 22-3310) (Emphasis added.)

   1892: *"An act for the preservation of the public peace and the protection of property within the District of Columbia" …unlawful for any person willfully* ***top****, cut down, remove, girdle,* ***break, wound, destroy, or in any manner injure*** *….any tree not owned by that person…"*

2. Policy produced by District of Columbia, June 9, 1960, "Trees in Public Space: Washington, DC," at pg. 17.

   1960: *"Utility lines must be cleared by the use of directional clearance methods only…..the removal of internal branches to permit passage of utility lines through the trees where necessary"*

Many of the older trees conflict with the Pepco distribution system such that the issues with the various trees cannot be resolved without cutting entire "legacy" trees down. No standardized practice or agreement currently exists to resolve these conflicts. Pepco continues to work with UFA to resolve these issues on a case-by-case basis and in accordance with the Vegetation Management Plan for Utility Tree Pruning – District of Columbia (2005 Plan).[27]

In 2016, the Urban and Forestry Protection Act of 2002 was amended." The 2016 changes heightened the requirements to obtain permits to remove private trees. A "Special Tree Permit" is required to remove private trees as small as 13.9" diameter and the fee increased by 63%.

Mitigation and Tree Planting Programs

Pepco's tree planting funding mitigates removals and promotes "Right Tree Right Place" best management practices around utility space. In 2021 Pepco planted 351 trees in the District of Columbia and contributed $19,057 to the DC Tree Fund (in the form of special tree removal permits).

[27] The 2005 Plan was produced as a result of a tree-trimming working group including members from the District Department of Transportation's Urban Forestry Administration and Pepco's Vegetation Management team. Pepco filed the 2005 Plan on March 17, 2005 in Formal Case No. 982.

Selective Application of Herbicide and Tree Growth Regulators

Pepco's VM program includes the use of herbicide and tree growth regulators. An herbicide plan is developed each year to control brush and sprout growth where trees have been previously cleared. Herbicide applications are used selectively on rights-of-way, easements and, when granted permission, on private property, throughout the Pepco system in the District of Columbia. The use of herbicides follows a systematic approach with the aim of reducing woody stems from growing in the utility space. Herbicides and growth regulators used on Pepco's ROW are extremely low in toxicity and are biodegradable. Most herbicides affect treated plants by inhibiting the production of chemicals which plants need to produce chlorophyll, or by inhibiting the formation of leaf-buds. Without chlorophyll production, or functional leaves, the treated plant exhausts its stored food supply and dies. Tree growth regulators reduce the cell elongation of trees, which can help to extend the cycle time that we need to return to prune a tree again. Only herbicides and growth regulators registered by the U.S. Environmental Protection Agency (EPA) and D.C. Department of Environment are applied in strict accordance with the label and under the regulation of United States Department of Agriculture (USDA). Pepco contract applicators are supervised by certified commercial pesticide applicators.

Customer Communication Materials

- Provide consistent notification to customers regarding Pepco's VM activities on their property and in their community;
- Provide information to customers explaining the VM program along with a schedule of trim and contact information;
- Make available Pepco forestry representatives to respond to inquiries as work is being done and scheduled;
- Encourage customers to access the Pepco website for more detailed educational material including links to ANSI A330 standards, Utility Arborist Association, and the "Right Tree, Right Place" program under the Arbor Day Foundation;
- Enable the planners to meet with customers and local officials, or correspond through mail, e-mail, and phone as needed;
- Enable work permits to be obtained in advance of scheduled work to allow work to continue in a coordinated and planned manner;
- Participate in community meetings; and

- Coordinate public awareness of Pepco's VM activities and programs through the use of door hangers that are placed on customer's door prior to start of VM work.

Customer Communications: VM

See Attachment A for an example of the Company's 2021 customer communications, which is an example of pertinent information that is relayed to customers as bill inserts and other means of communication.

1.20 Industry Comparisons[28]

The Industry Comparisons section contains industry comparisons of transmission and distribution operations and performance. The comparisons of reliability indices are provided in Figures 6 through 8 in response to Commission directives in Formal Cases No. 766 and 982.

Institute of Electrical and Electronics Engineers (IEEE) Benchmarking Survey Results

Each year, Pepco participates in the annual Transmission and Distribution System Benchmarking Study conducted by IEEE. Although Pepco's District of Columbia service territory did not participate separately in the study, the Company has calculated separate values for Pepco's District of Columbia territory in both 2020 and 2021, using the MSO reporting criteria and has indicated both reliability results on the following charts. Note that Pepco's 2021 reliability results that are reported in the following graphs are not directly comparable to the data used in the 2021 study. See Figure 6 through Figure 8.

[28] In Order No. 15568 paragraph 57, the Commission ordered the following:
57. Pepco IS DIRECTED to provide a report on the Electric Utilities Best Practices, consistent with Paragraph 50 of this Order. This report shall be included in that 2010 Consolidated Report; and shall include the best practices of the electric utility industry on improving reliability and outage restoration (from the Benchmarking Studies). Pepco shall submit a continuous improvement plan, including resourcing, specific performance targets, and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparable) utilities in the Benchmarking Studies.

Figure 6 IEEE SAIFI Industry Comparison

Major Event Excluded (IEEE SAIFI 2021)

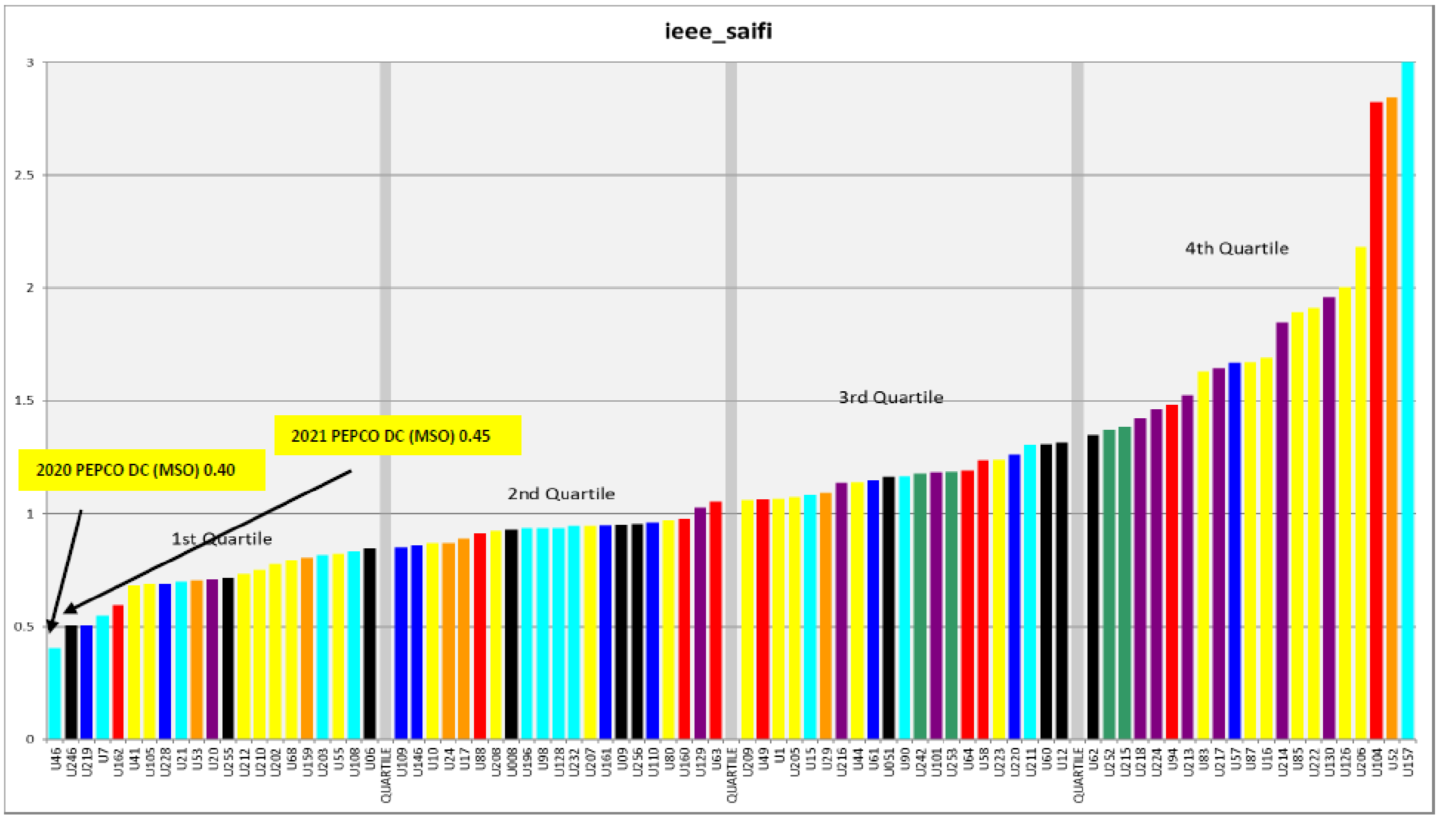

Figure 7 IEEE SAIDI Industry Comparison

Major Event Excluded (IEEE SAIDI 2021)

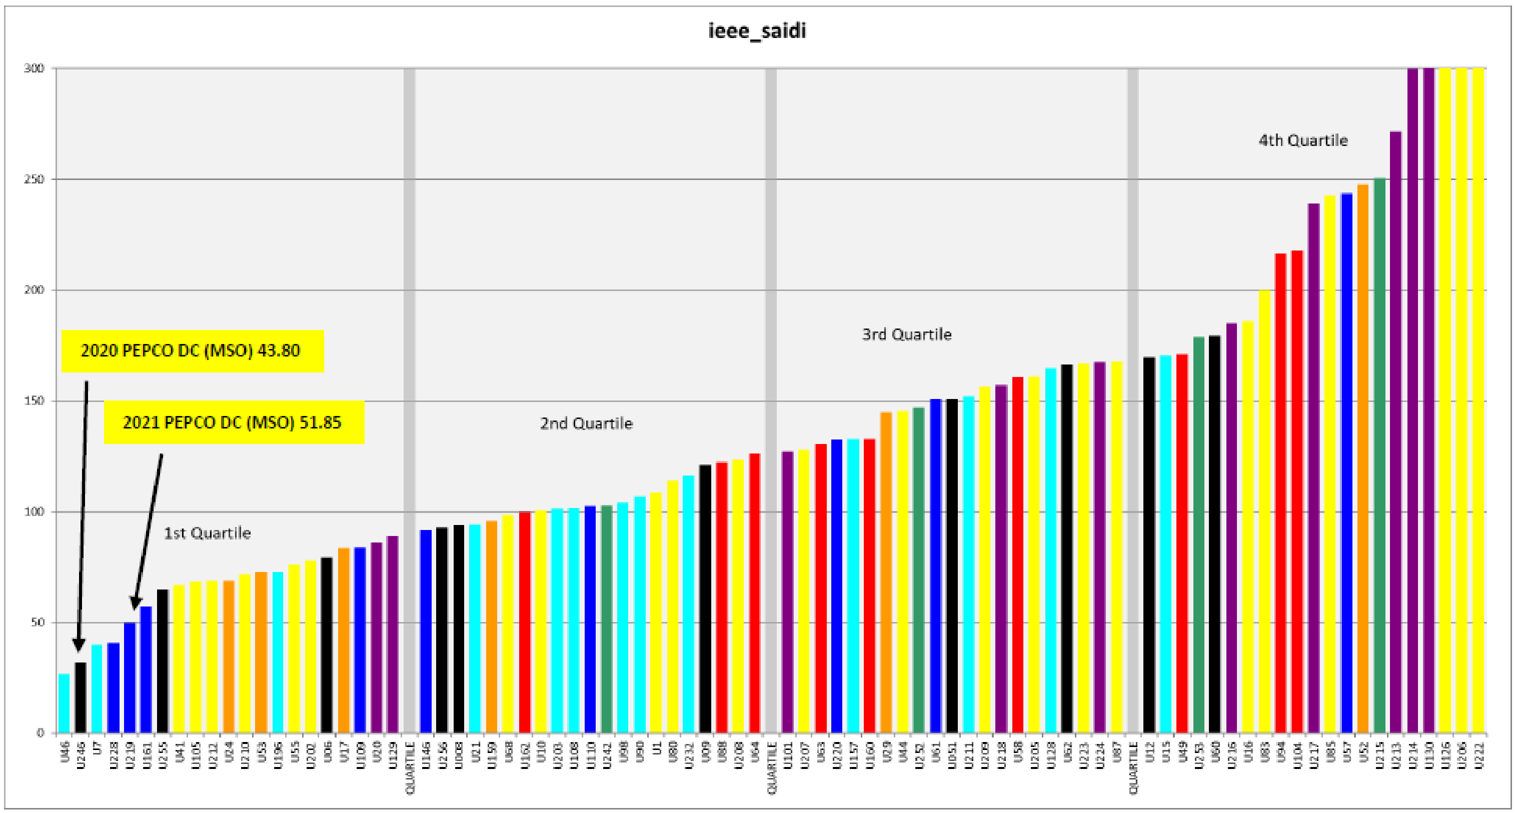

Figure 8 IEEE CAIDI Industry Comparison

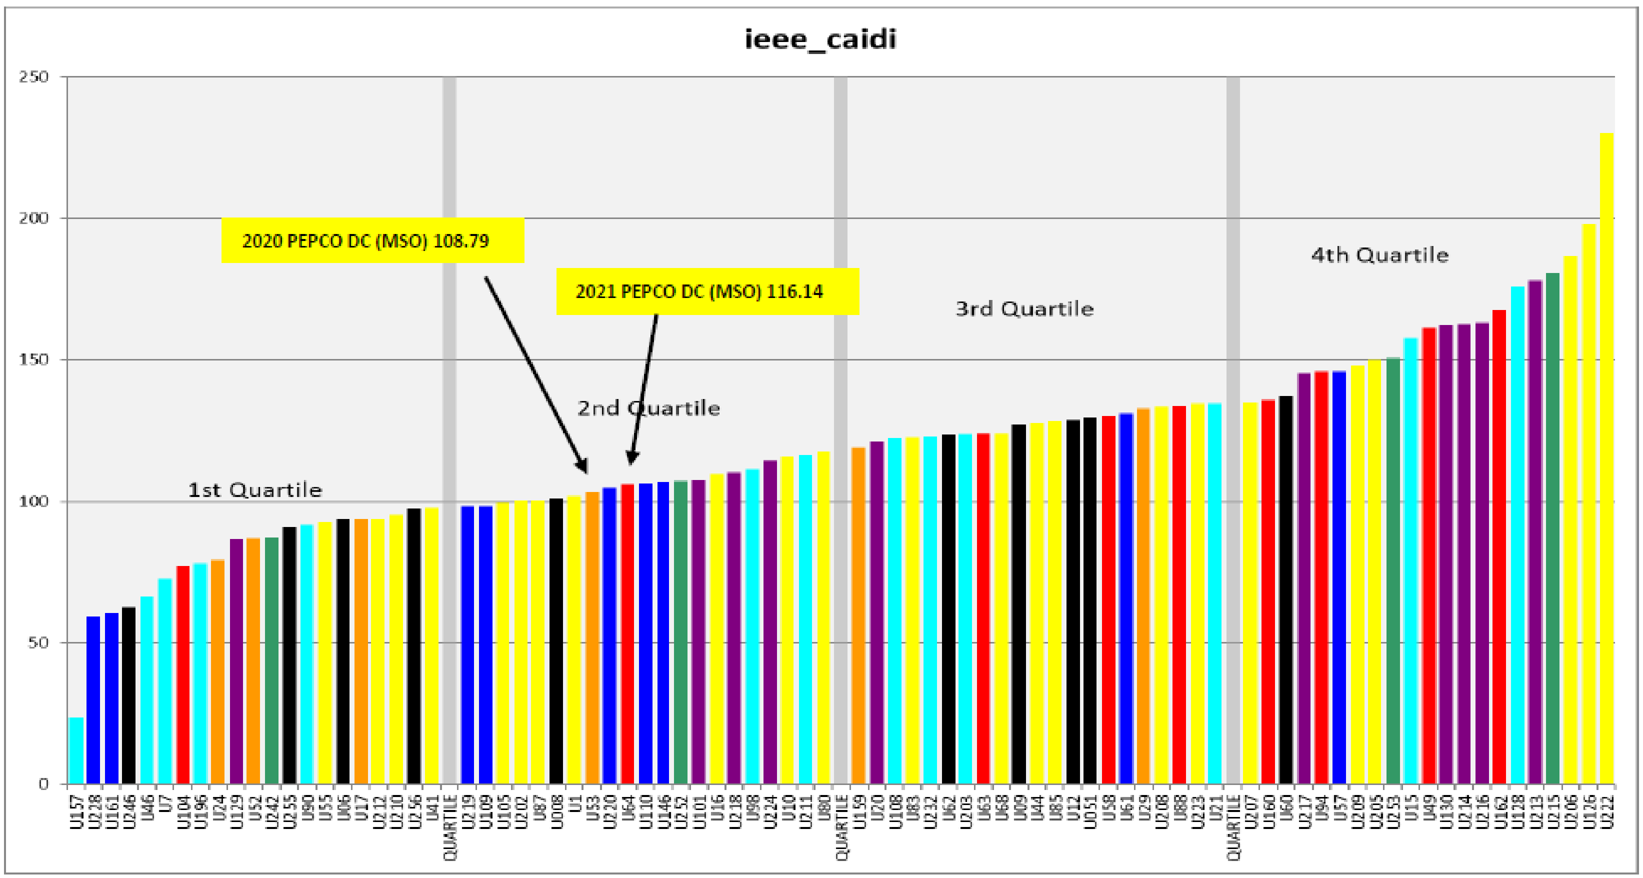
Major Event Excluded (IEEE CAIDI 2021)



1.21 Best Practices

Implementation of Twenty Best Practices[29][30][31][32]

Regarding the best practices, Pepco must provide the following explanations:

1. **Cost allocation across companies and jurisdictions:** Many of the activities associated

---

[29] In Order No. 16091 paragraph 61, the Commission stated the following:
61. Pepco IS DIRECTED to include a "2011 Best Practices Report" in its 2011 Consolidated Report describing its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program, consistent with Paragraph 22 of this Order;
22. Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568. Second, as to the Staff's Recommendation that Pepco file a "Best Practices Report" from the PA Consulting's 2009 Polaris Transmission and Distribution Benchmarking Program, we agree that a report may be helpful in assuring that best practices continue to be implemented. Therefore, the Commission shall require that Pepco include in its 2011 Consolidated Report a section entitled "2011 Best Practices Report" in which Pepco shall describe its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program included in the 2010 Consolidated Report as Appendix 2D. The twenty best practices selected by Pepco should be those judged to have the most impact on reliability and outage restoration performance. Pepco shall report on all its activities during 2010 to implement these best practices, including data on staffing levels, expenses and results. This requirement is separate from the requirement to produce a "Continuous Improvement Plan," as is described more fully in Section IV.A.1.f.
[30] In Order No. 15632 issued in these proceedings, the Commission states at paragraph 5 the following:
5. Pepco shall file with the Company's annual Consolidated Reports to the Commission data on the Company's measures to continue to address each of the recommendations made by PA Consulting and the effectiveness of the Company's approaches to improve CAIDI and SAIDI to at least the average of
[31] Order No. 16623 states the following at paragraphs 29 and 52:
29. Decision: The Commission agrees with the Staff that the information provided in the 2011 Consolidated Report does not allow a complete assessment of Pepco's progress in implementing the twenty "best practices." Therefore, we direct Pepco to provide further information for each "best practice," including staffing levels, expenses and schedules and percentage of completion. In those cases where no incremental expenses or staffing occurred, we require Pepco to identify the other activities with which these best practices were combined "for efficiency" and provide expenses and staffing levels associated with those activities. In order to provide a comparative analysis, we require Pepco to provide budget vs. actual expenses and staffing levels for the period 2007 to 2011. We also require Pepco to provide an assessment of the progress it has made in fully implementing each best practice. In addition we require Pepco to identify whether and how each best practice has been incorporated within its Comprehensive Reliability Plan.96 This information shall be included in the 2012 Consolidated Report.
52. Pepco is DIRECTED to prepare a report on best practices consistent with paragraph 29 herein;
[32] 35 Order No. 16975 states the following at paragraphs 85 and 114:
85. Decision: The Commission finds that Pepco has failed to comply completely and explicitly with the requirement that it identify "whether and how each best practice has been incorporated within its Comprehensive Reliability Plan." While Pepco includes some of its best practices as part of the REP, it does not discuss each best practice, as required by Order No. 16623. The Commission agrees with OPC that "including these practices within the REP would be an effective means for improving reliability." Pepco is required to fully address the role that each best practice has in the REP in its 2013 Consolidated Report and in future Consolidated Reports. If a best practice is not part of the REP, then Pepco shall explicitly state that fact.
114.Pepco is DIRECTED to address the role each best practice has in the Reliability Enhancement Plan consistent with paragraph 85 herein;

with the best practices described herein are performed by centralized teams supporting all PHI companies or teams supporting Pepco system-wide. Budgets and expenditures of departments that serve all of PHI are not directly attributable to one jurisdiction or another.

2. **Redirection of resources:** The implementation of some best practices by these teams did not necessarily require additional resources, but rather either required the allocation of additional duties or a shift in duties from previous practices to the newly identified best practices. Further, activities supporting the best practices are only a subset of all work done by these departments, and the activities of many of the primary personnel involved in executing and advancing these best practices are allocated to general overhead accounts.
3. **Reported best practices costs:** In past years, the Company has attempted to allocate estimated resource hours and associated activity-based costs in these centralized functions to the District of Columbia.

Given the passage of time since this directive was issued, and that this directive was linked to the REP, the practices themselves and associated directives can no longer be broken out as previously directed. While the Company certainly incorporates these and other best practices from its sister utilities and the industry at large, the information requested cannot be provided in the form requested.

1.22 ECA Teams[33][34][35]

A discussion of costs and benefits, as required by Order No. 16975, is provided below.

ECA driven projects generally consist of planned projects to replace large, high cost, long lead time primary components within substations. Targets for these projects are usually selected by condition-based criteria such as dissolved gas in oil analysis. However, due to certain external drivers (such as load, location, environment, and system criticality), these replacements may also be triggered by historic performance of a component. These projects are primarily driven by Pepco's need to manage contingency risk and do not result from cost / benefit analyses. Replacements are usually in-kind or upgrades and depend on component availability at the time. System emergencies can alter the prioritization of these projects.

The utility's obligation to serve requires substation design criteria which provides redundancy and risk management. Although substation component failures are rare in comparison to feeder components, the loss of a critical substation asset could result in long term outages affecting thousands of customers. The provision of redundant components, backup sources, and minimization of single points of failure in substation designs reduces this risk and generally allows Pepco to perform routine maintenance and upgrades without the need for planned outages. This redundancy also allows Pepco to manage contingencies and continue service despite the loss of a major substation component. As such, substation reliability is maintained by keeping both the primary and redundant assets in good working condition. Therefore, condition and criticality of assets predominantly drives substation reliability programs and many projects in the substation reliability category do not directly translate to improvements in outage frequency and duration. This concept is

[33] Order No. 16975 states the following at paragraphs 39 and 98:
39. Decision: …Specifically, the Commission directs Pepco to report on the recommendations and actions taken by the ECA team, including membership lists, meeting dates and minutes, analyses of impact of the ECA team on maintenance or replacement policies and asset management strategy and tactics. We also require Pepco, to the extent not already included, to report on costs for recommended equipment replacements and the projected benefits of those replacements, as OPC suggests. Further, the Commission directs Pepco to provide an explanation of how the work of the ECA team relates to other Pepco reliability initiatives and include a discussion of the equipment failure analysis as part of future years' Consolidated Reports.
98. Pepco is DIRECTED to include a report on the results of its Equipment Condition Assessment work consistent with paragraph 39 herein;

[34] The ECA minutes have been modified in response to the Commission's directive "to include a brief description of the project status *(i.e.*, whether it is deferred, completed or ongoing)," *In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company*, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 231 (February 27, 2015).

known as Reliability Centered Maintenance (RCM), the principles of which dictate that predictive maintenance activities serve to identify failing assets prior to catastrophic failure.

Substation assets are inspected under various inspection programs, including visual, infrared, and oil sampling where applicable. Based on observed condition and potential system risk, assets are cleared for normal duty, scheduled for closer monitoring, scheduled for maintenance, selected for immediate replacement, or added to prioritized programmatic replacement programs, as appropriate. Pepco's ECA process is the vehicle used to identify substation assets for condition-driven replacement in order to maintain the reliability of the substation. The ECA process cooperatively analyzes major equipment condition, makes major repair / replace decisions utilizing various subject matter experts and through consensus, prioritizes candidates for replacement on a quarterly basis.

Substation assets such as transformers, breakers, and larger components typically have long lead times and must be ordered well in advance (months to years) of anticipated need. For this reason, several replacement projects are kept in the project pipeline at any given time. This allows Pepco to substitute one project for another in situations where long lead times would subject the system and customers to significant reliability risk. Projects are engineered and built using standard designs and approved equipment.

Generally, substation reliability projects cannot be translated into measurable or forecasted SAIDI or SAIFI benefits. The presence of redundant systems within substations reduces or eliminates the direct threat to customer reliability from the loss of a single asset. However, the failure of such assets reduces the security of supply to feeders and elevates the risk of large-scale customer outages. Given the potential for customer impacts along with the long replacement cycle of major substation assets, Pepco replaces these assets proactively based on condition assessment and the desire to manage such contingency risk.

A summary of the four quarters of ECA meetings for 2021 are included below. The format has been changed to summarize the data while retaining requests for greater clarity regarding timing, costs, and completion of projects.

Pepco-DC Region Equipment Condition Assessment

BATTERIES:

Location	EPS	ITN	2021 Spend	Status
Sub 124 22nd Street	PC19QS096	70602	$168,691	Completed
Sub 181 Chesapeake Street	PC19QS097	70602	$21,330	Completed
Sub 111 Texas Avenue	PC20QS132	70602	$33,429	Completed
Sub 152 MacArthur Boulevard	PC21QS021	70602	$3,069	Completed
Sub 100 Fort Davis	PC21QS025	70602	$579	Completed

Meeting Attendees:

1st through 4th Qt. 2021

Title	Department
Manager Transmission & Substation Engineering	PSC Equipment Standards
Principal Engineer	PSC Equipment Standards
Senior Engineer Standards	PSC Equipment Standards
Senior Engineer Standards	PSC Equipment Standards
Senior Engineer Standards	PSC Equipment Standards
General Engineer	PSC Equipment Standards
Engineer	PSC Equipment Standards
Associate Engineer	PSC Equipment Standards
Manager Transmission & Substation Engineering	PEPCO Substation Engineering
Supervisor of Engineering	PEPCO Substation Engineering
Senior Engineer	PEPCO Substation Engineering
Senior Engineer	PEPCO Substation Engineering
Senior Engineer	PEPCO Substation Engineering
Senior Engineer	PEPCO Substation Engineering
Manager Regional Capacity Planning	PEPCO Distribution Planning
Principle Engineer	PEPCO Distribution Planning
Senior Engineer	PEPCO Distribution Planning
Sr. Engineering Tech Specialist	PEPCO Distribution Planning
Manager Regional Electrical Operations	PEPCO Sub Construction & Maintenance
Sr. Engineer	PEPCO Sub Construction & Maintenance
Engineering Tech Specialist	PEPCO Sub Construction & Maintenance
Principle Project Outage Coordinator	PEPCO System Operations

ECA Summary Table

To avoid outages similar to the Florida Avenue Substation outage that occurred in 2019 and to obtain a holistic view of the substation equipment in the District, the Commission directed Pepco to file an ECA summary table within 90 days of Order No. 20766 issued in July 23, 2021 including the following: (1) existing condition of various equipment within each of the distribution substations in the District; (2) date of the last performed maintenance; and (3) outstanding issues to be remediated. The Commission also directs Pepco to provide the above summary in future ACR filings. Pepco has complied with this order and filed an ECA summary table on October 18, 2021, and is including an ECA Summary as Attachment G. There were no updates to this table since the October 18, 2021, filing.

1.22 STORM READINESS

Pepco's mandate is to provide safe and reliable electric service. This is the basis for all Company contingency operations, including storm restoration, and is the foundation for the storm restoration objective of safely restoring electric service to the greatest number of customers in a minimum amount of time. The Pepco District of Columbia Major Service Outage Restoration Plan (MSO Plan) uses these principles to assess damage across the entire Pepco service area and to establish restoration guidelines for preparedness, pre-storm planning, storm response, communications, and post-storm evaluations.

The PHI Crisis Management Plan and the MSO Plan necessarily modify the normal corporate organization, in accordance with the National Incident Management System's (NIMS) Incident Command System structure and manages this amended structure to accomplish storm restoration and emergency response. The Pepco Regional Incident Management Team (IMT) assigns personnel to this temporary structure to efficiently restore customer service. The overall governing principle of the Pepco IMT is to match resources to restoration requirements. The Pepco IMT is flexible in order to adjust resources to the various types of restoration efforts that may be required and to enable restoration activities to be prioritized to restore the largest number of customers first across Pepco's service territory. All Company resources, including Operations, Logistics, Planning &Analysis, and Finance and Administration are dedicated to customer service and the storm restoration effort.

Each branch of the Pepco IMT can expand or contract staffing for the response effort as necessary. Storm positions are activated based on the support or response functions required for efficient restoration. Pre-established storm duties are maintained for each storm position. The Staging Area branch of the IMT is activated under unique circumstances.

The increased number of customer calls during storms requires additional staffing at the Customer Operations Call Center to answer customer inquiries and to supplement the automated entry of customer outage information. In the event of a major storm, Pepco's High-Volume Call Answering (HVCA) System can be activated to takes the high volume of outage calls Pepco expects in the immediate aftermath of a major storm. This HVCA system can answer more than 100,000 calls per hour to reduce the incidence of busy signals and hold times and is most efficient in the early stage of the restoration process. Once the initial outage reports are in, the Company can disable the automated call system and staffs the Pepco call center with additional employees who are trained to assist call center representatives in handling the increased volume of calls. All areas in the Customer Care Group, in performing their second roles, are required to provide support to the Call Center. Additional personnel across the Company provide assistance through their incident response role assignments and help to relay accurate information between customers and operations

Communication requirements for internal as well as external groups are identified in advance, planned for, and monitored for effectiveness during storm response. Accurate, timely and coordinated communications provide a vital link in the restoration response. Approximately 48 hours in advance of a significant major storm with predicted multi-day outages, Pepco notifies customers who are enrolled in Pepco's Emergency Medical Equipment Notification Program so they can prepare to implement their contingency plans in the event of power outages. Pepco also notifies regulatory and government officials and emergency management agencies of its storm preparations and to discuss any special concerns. Operational communications coordinate field restoration activities. Communication roles in the PHI Crisis Management Plan and the MSO Plan provide for a proactive and flexible communication strategy.

The Storm Restoration Objectives are to safely restore electric service to the largest number of customers in a minimum amount of time. This requires advance planning and pre-storm preparation. Advance planning during non-storm conditions enables operational readiness for restoration activities. In addition to drills and exercises designed to lead employees through a variety of emergency scenarios, Pepco also works with local emergency management agencies and a cross-section of community, government and business leaders in a collaborative effort to review restoration plans and practices to develop more effective ways to improve Pepco's response.

In addition, Pepco actively pursues a public education and awareness campaign that includes initiatives such as the "Weathering the Storm" brochure. These publications and additional brochures contain information about the Company's Emergency Medical Equipment Notification Program, tree trimming, and portable generator safety, all of which are available upon request as well as on Pepco's web site. These materials and information provided in Pepco's monthly newsletter that is mailed to customers with their bill provide information that help families and individuals prepare in advance for any emergency situation and are a significant component of Pepco's advance planning efforts. Additional preparedness information, as well as neighborhood outage maps, with information regarding each outage event, including the ETR, is also available on the Pepco web site.

Pre-storm preparation is the process of preparing for mobilization before a storm occurs. When a significant major storm threatens, Pepco begins preparations, when possible, by reviewing Pepco's inventory of storm repair materials and notifying vendors of the potential need for material procurement. To plan for sufficient staffing, Pepco informs employees of the pending storm and the potential for activation of their incident response second role assignments. The Company also alerts Pepco contractors and discuss plans for possible aid from the utilities within Pepco's participating mutual assistance groups. Both advance planning and pre-storm preparation activities enable a state of preparedness to transition smoothly to IMT operations and to minimize restoration time.

After a storm affects the electric system, assessment and restoration begins. Damage Assessment requires an on-going evaluation of the substations shut down, distribution feeders locked out, and feeders with damaged segments, as well as the areas and the number of customers affected. This continual process enables efficient and appropriate allocation of restoration resources. The IMT is activated to provide customer communications and to coordinate the mobilization of crews for system repairs. Since damage assessment is on-going and storm levels may change in intensity, the restoration strategy may be modified throughout the effort, and the level of mobilization may be adjusted to meet restoration requirements.

Adequate supplies of materials, tools, and equipment are necessary for restoration to proceed safely and efficiently. Logistics include procuring, maintaining, and transporting restoration resources, personnel and materials. Departments are responsible for determining logistics requirements on an on-going basis and maintaining procedures.

When major reconstruction work or significant outside resources are required for system restoration, a staging area may be established. Staging Areas are defined as sites where crews and materials are temporarily stationed in severely damaged areas of the service territory. Staging areas are set up to respond to specific restoration efforts with assigned crews and on-site materials. Sites are selected for their accessibility, parking, and space to store materials needed for reconstruction and restoration of customer service, and ability to house and feed crews.

During major outage events of extended duration Pepco can use resources from other PHI companies, if available, or request mutual assistance from one of several regional and national mutual assistance groups in which it participates. These groups meet periodically to review policies, procedures and work practices to ensure continued ability to provide mutual assistance between electric utility companies. Post-event evaluations following major service outages contribute to continuous improvements to the Pepco District of Columbia MSO Plan. Response activities are most likely to improve when recommendations are linked and incorporated into the plan and departmental support procedures. These links serve as the vehicle to enhance response plan capability. Trained personnel are essential for successful execution of storm response duties. Additional training requirements may be highlighted as a result of debriefings or drills.

Further, during major outage events, Pepco uses AMI to enhance storm restoration efforts. For example, during those major outage events, Pepco's AMI capability to "ping" meters help to determine whether a customer has electric service. This application of Pepco's AMI network contributes to reducing restoration times, and avoiding costs, without necessitating phone calls to customers thus minimizing unnecessary costs. It also materially reduces the number of truck rolls needed to verify customer restoration, helping ensure that crews are dispatched efficiently.

Drills and Functional Exercises

In 2021, Pepco held a combined Service Center Drill at the Forestville and Rockville Service Center on October 3. In addition, the Pepco IMT (Incident Management Team) held their annual Drill on June 3rd which satisfied their regional exercise requirements. In 2021, Pepco also participated in GridEx VI, exercise on November 16-17, 2021, to exercise our response and recovery plans in the face of simulated, coordinated cyber and physical attacks on the North American bulk power system and other critical infrastructure. GridEx is the largest grid security exercise in North America. Hosted every two years by NERC's Electricity Information Sharing and Analysis Center (E-ISAC).

In conjunction with the MSO Plan, Pepco may also activate PHI's Crisis Management Plan. PHI's Crisis Management Plan defines the management structure and outlines response activities for extensive emergencies, including unplanned events that can cause significant injuries to employees, customers or the public; cause physical, environmental or technological damage; or can shut down the business or disrupt operations. This plan also provides general guidelines allowing PHI and Pepco sufficient flexibility to respond to any emergency condition promptly and effectively.

PART 2: PIP

Section 2 <u>Requirements</u>

On November 1, 1982, in Order No. 7668, the Commission adopted final rules regarding the submission of an annual PIP in Formal Case No. 766. These rules are codified in Title 15 of the District of Columbia Municipal Regulations, Chapter 5, Rules 502.1 and 502.2. In 1982, the Commission also directed the Company to establish the Productivity Improvement Working Group (PIWG), consisting of representatives from the Commission Staff, the Office of the People's Counsel (OPC), and Pepco to provide a setting for communication among all parties and Commission Staff during the developmental stage of the first annual Productivity Improvement Plan (PIP) With the divestiture or transfer to an affiliate of all of Pepco's generating stations, the primary focus of the PIP and PIWG has shifted instead to transmission and distribution operations, performance, and reliability.[36] Later, Order No. 16623 emphasized a focus on reliability for the ACR.

[36] In Order No. 15152 on the 2008 Consolidated Report paragraphs 68 the Commission stated the following:
68. The Productivity Improvement Working Group, which includes OPC, provided a reasonable definition of a productivity improvement project in 2006. Specifically, the PIWG states:
T&D productivity improvement projects were considered those projects that will increase T&D system efficiency by reducing losses and improve[ing] system reliability, and which may defer more costly additions to the electric system. (Footnote: F.C. No. 766, Decision on Consideration of OPC's T&D Productivity Improvement Working Group in Response to Commission Order No. 13754, filed July 6, 2006 ("2006 PIWG Report"), at 2.)

2.1 PIWG

As discussed above, the PIWG has evolved over the years since its establishment but continues to serve as a standing committee for collaboration among the Commission Staff, the Office of the People's Counsel (OPC), and Pepco. The PIWG meetings address issues of interest to the Commission or PIWG members. Agendas and meeting frequency are determined according to issues of immediate concern to PIWG members and according to directives of the Commission. The PIWG generally meets no more frequently than monthly, but at least once per quarter. A discussion of the items on the next meeting's agenda usually occurs at the end of each PIWG.

2021 PIWG Activities

The PIWG met four times in 2021. The 2021 PIWG meeting dates and meeting minutes filing dates are shown in Table 16 as follows:

Table 16: 2021 PIWG Meeting Dates and Meeting Minutes Filing Dates

Meeting Date	Filing Date of the Meeting Minutes (See Formal Case No. 766 and PEPPIWG)
Mar. 23	Apr. 12
Jun. 30	Jul. 9
Dec. 7	Dec. 17
Dec. 20	Dec. 20

2.2 PIP

In Order No. 16623 on the 2011 Consolidated Report, the Commission stated the following in paragraph 8: "As a preliminary matter, we note our continuing concern with the reliability of the Pepco electrical distribution system… It is through the prism of these [reliability] efforts that we consider the Pepco Consolidated Report." In accordance with the Commission's focus in Order

The power serving the District's Standard Offer Service customers is now procured through a wholesale procurement process by PEPCO and, as such, productivity improvement is applicable only to transmission and distribution issues. We find the PIWG's definition of a productivity improvement project workable and adopt it here.

No. 16623 and the guidance of the PIWG, the Company presented its PIP projects, with a strong emphasis on reliability.

The 2021 PIP projects were as follows:

- 4 kV Distribution Substation Automation Projects
- 4 kV to 13 kV Conversion Projects
- DA Projects
- Priority Feeder Projects

PIP Project Status

The year-end 2021 status of the PIP Projects is included in Table 17.

Table 17 2021 PIP Projects

Item	Description	2021 Project Totals *(Dollars in Thousands)*		
		Actuals	Budget	Variance Over / (Under) Budget
1	4kV Distribution Substation Automation Projects	730.1	507.7	222.3
2	4kV to 13kV Conversion Projects	8,225.7	16,875.9	(8,650.2)
3	Distribution Automation Projects	7,252.3	4,766.0	2,486.3
4	Priority Feeder Projects	3,684.7	1,832.7	1,852.0

2.3 PIP Project Detail

Detail addressing each of the 2021 PIP projects – including work completed in 2021, work forthcoming in 2022, and longer-term plans – is provided below.

4 kV Distribution Substation Automation Projects

The substation automation work at Macarthur Boulevard Sub 152 and will be completed in Q4 of 2022. The construction at Texas Avenue Sub. 1 1 1 is expected to be completed in the summer of 2022.

4 kV to 13 kV Conversion Projects[37][38]

These projects are included in the Load Growth program.

Background: The 4 kV distribution system supplies load throughout various neighborhoods in the District of Columbia. The 4 kV system has provided an effective and reliable supply to Pepco customers for many years. However, the 13 kV system is capable of supplying a greater density of load and generally produces less electrical losses. Therefore, as load density increases locally, or the system requires more maintenance and replacement becomes the best economic alternative, the 4 kV system is gradually being replaced with a 13 kV distribution system.

Magnitude of the Conversion: There are presently 108.7 megawatts of 4 kV load on the Pepco system, mostly in the District of Columbia. Over the next ten years, approximately 37.0 megawatts (including growth) will be converted to 13 kV service. Allowing for load growth, approximately 72.0 megawatts are projected to remain on the 4 kV distribution system by 2031. This 4 kV load will be located primarily in Wards 3, 7 and 8 where the load is served by substations that have either multiple transformers or are networked together through the feeder primaries. These remaining 4 kV areas are considered reliable due to the shortness of the feeders and the availability of ready backup. Areas that are going to be maintained and not converted will involve upgrading of substantial transformer equipment and other supporting equipment.

Areas Scheduled for Conversion: Areas supplied by the following substations are scheduled to have conversion work performed in the next ten years:

[37] In Order No. 16091 at paragraphs 50, 53, and 64, the Commission stated the following:
50. Decision. We agree with the Staff recommendation and require Pepco to provide justification for any deviations from the plan schedules and annual budgets for 4 kV to 13 kV conversion projects in its Consolidated Reports, excluding minor deviations of less than 5%. This information may be provided in the discussion of "Reliability Projects."
53. Decision. …we have not adopted the Staff's "replace or rebuild" recommendation. However, we agree that future Consolidated Reports should contain detailed schedules and budgets for Reliability Projects, as well as justification for deviations from those schedules and budgets. We shall require Pepco to submit such schedules in future Consolidated Reports.
64. Pepco IS DIRECTED to provide detailed schedules and budgets for conversion projects, as well as justification for any non-minor deviations from these , consistent with Paragraphs 50 and 53 of this Order;
[38] Commission Order No. 16623 states the following:
32. Staff Recommendation: Require Pepco to provide and submit a report as to whether the budgets and schedules for each of the four 4 kV to 13 kV conversion projects have undergone non-minor deviations from previous plans. Include the justification for such deviations.
33. We accept the Staff's recommendation and direct Pepco to include a complete update in the 2012 Consolidated Report, including changes in budgets and schedules and justification for each non-minor deviation.
54. Pepco is DIRECTED to provide a report of conversion projects consistent with paragraph 33;

• Georgetown Sub. 12	NW	Underground conversion.
• North Capitol Sub. 40	NE	Overhead conversion
• Twelfth Street Sub. 126	SW	Underground conversion
• Anacostia Sub. 8	SE	Overhead conversion
• "G" Street Sub. 28	SE	Underground conversion

All of the projects described below are multi-year projects with multiple phases. Four of the five projects were initiated prior to 2015. "G" Street was accelerated to begin work in 2016 to build infrastructure to extend new 13 kV feeders. This was done because significant new loads are expected to materialize in the "G" Street area and the existing 4 kV infrastructure is inadequate to meet this expected new load. Dollars spent on these projects may fluctuate over the years to account for project phasing. The Anacostia conversion work is scheduled to be completed during 2022. The overall budget for the 4 kV conversion projects is still in line with the Company's long-term conversion plan.

Status: In 2021 Pepco spent $8,225,654 on its 4 to 13 kV conversion projects, listed above, $8,650,209 less than the budget of $16,875,863. The deviation between the 2021 budget and actual expenditures is due to a combination of work being delayed by re-design, permitting and work time.

Convert a part of the load at Georgetown Sub. 12 from 4 kV to 13 kV and retire 4 kV Substation

A modernization of this area infrastructure started in 2001. It includes the 4 kV to 13 kV conversions that will ultimately retire the 4 kV radial distribution system supplied from Georgetown Sub. 12. The 4 kV to 13 kV conversion has been completed for the area between M Street to the south, P Street to the north, Wisconsin Avenue to the west and 27th Street, NW to the east, by extending two 13 kV distribution feeders from Georgetown Sub.

In addition, conversions along M Street, Prospect Street, and N Street west of Wisconsin Avenue were completed in 2010 and 2011. Conversions along O and P Streets west of Wisconsin Avenue concluded in 2012.

Existing Configuration: The 4 kV underground radial distribution system serves mostly residential and some small commercial loads. Moderate load growth is anticipated for this isolated area but there are basically no external ties to deliver this power. The existing underground infrastructure, conduit and cable are in need of remediation with a history of extended outages due to limited transfer capability and circuit configuration and conduit construction that limits the size of cable that can be installed and provides limited physical protection to the cables.

The Georgetown 4 kV substation was rebuilt in the 1980s however the 4 kV underground infrastructure is the original construction and is nearing its full capacity.

Proposed Enhancement: Convert all 4 kV load to 13 kV with the exception of Francis Scott Key Bridge which feeds Roosevelt Island where step-down transformers are being considered due to access limitations and the retirement of all 4 kV substation equipment.

Status: With the exception of a few remaining transformers, conversions of the area north of M Street were completed in 2016. Due to the unanticipated non-constructability of the previous plans, all construction was placed on hold and Pepco revised the conversion work and released a new Construction Recommendation Plan in 2020.

The revised plan is a combination of traditional 4kV conversion work, load transfers to neighboring LVAC networks and possible consideration of other solutions. The new designs plan around the "K" Street bridge crossing and the re-supply of load from Feeders 29 and 91 to other substations. Under the current schedule, work to retire the remaining five feeders should be completed by 2024. However, Pepco continues to encounter delays due to the network conversion portion which requires checking customer premises. The 2021 budget was $2,409,734 and approximate spend for 2021 was $686,561.

Georgetown Sub. Conversion Budget:

2022 – 2026 Budget (Figures in Thousands of Dollars)

2022	2023	2024	2025	2026	Total
$3,624	$3,995	$0	$0	$0	$7,619

Convert load at North Capitol Sub. 40 from 4 kV to 13 kV and retire 4 kV Substation

This project related to the extension of existing and new 13 kV feeders to convert all 4 kV load served by North Capitol Street Sub. 40 to 13 kV. The North Capitol Street 4kV system served mostly residential and small commercial customers in the Manor Park, Fort Totten, and Petworth neighborhoods. The first phase of this project converted load from portions of North Capitol Sub. 40 Feeders 482 and 485 along 4th Street, NW between Buchanan and Hamilton Streets, NW to Fort Slocum Sub. 190 - 13kV Feeders 15006, 15012 and 15015 was completed in 2013. 2014 saw the completion of conversions along Hamilton Street, NW, Hawaii Avenue, NE and Fort Totten Drive, NE. In 2015, conversions were completed along North Capitol Street and Rock Creek Church Road.

Existing Configuration: The North Capitol Sub. 40 4 kV system was an isolated area on the Pepco distribution system that was not connected to any other 4kV substations or systems. Recent substation inspections revealed deteriorating circuit breakers. The Allis Chalmers switchgear necessitated the salvage of spare parts from like equipment because the original equipment manufacturer is no longer in business and other manufacturers no longer supply parts for this equipment.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire North Capitol Sub. 40 - 4 kV.

Status: As of the end of 2021, several 13 kV trunk extensions have been completed and approximately 11.0 MVA of the 4 kV load has been converted to 13 kV. In 2017, two new 13 kV feeders were extended from Fort Slocum Sub. 190 to facilitate conversions in the area bounded by Kansas Avenue, NW, New Hampshire Avenue, NW, 4th Street, NW, and Missouri Avenue, NW. The budget for 2021 was $697,250. Approximately $2,813,022 was spent in 2021.

North Capitol Sub. Conversion Budget:

2022 – 2026 Budget (Figures in Thousands of Dollars)

2022	2023	2024	2025	2026	Total
$0	$0	$0	$0	$0	$0

Convert load at 12th Street Sub. 126 from 4 kV to 13 kV and retire 4 kV Substation

This project will extend two 13 kV feeders in order to convert and/or transfer all 4 kV load supplied by 12th Street Sub. 126.

The 12th Street 4 kV system serves residential and small commercial customers in Southwest area and National Park Service buildings, streetlights and traffic signals in the National Mall area. The conversion and retirement of the 12th Street Sub. 126 will be done in two phases. Phase 1 will construct an 8-way conduit bank from 2nd and C street SW to the vicinity of 7th and Maryland Avenue SW. It will involve the construction of approximately 1 mile of 8-way conduit bank. Phase 2 will involve extending Feeders 15294 and 15295 to two new three-way switches. Loops will then be extended from the switches to supply load around the National Mall and Southwest Waterfront. The last phase will require extending Feeders 15294 and 15295 to two new 3-way switches and extending laterals to the area of Hains Point, the Tidal Basin, and the 14th Street Bridge.

Existing Configuration: The 12th Street Sub. 126 contains oil circuit breakers that will be removed based on the review of condition and reliability. One of the 13 kV/4 kV transformers is identified as in need of eventual replacement. These oil circuit breakers are no longer manufactured, and the manufacturer no longer provides spare parts. As part of the conversion process, this substation will be retired.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire Twelfth Street Sub. 126 – 4 kV including the transformers and oil circuit breakers.

These projects are included in the Load Growth program.

Status: Project completion date has moved from 2021 due to engineering & construction being on hold due to Project Management, Engineering and Design resource availability & turnover, rescoping & rebidding of remaining designs and permitting delays. Construction has resumed in February 2022. All remaining designs are to be completed in April 2022 and construction completed by the end of 2022. The budget for 2021 was $3,091,579. Approximately $872,010 was spent in 2021.

12th Street Sub. Conversion Budget:

2022 – 2026 Budget (Figures in Thousands of Dollars)

2022	2023	2024	2025	2026	Total
$2,166	$0	$0	$0	$0	$2,166

Convert Load at Anacostia Sub. 8 from 4 kV to 13 kV and Retire 4 kV Substation

The project relates to the extension of 13 kV feeders from Alabama Avenue Sub. 136 in order to convert all 4 kV load from Anacostia Sub. 8 4 kV and retire the Anacostia Sub. 8 – 4 kV substation.

The Anacostia Sub. 8 4 kV system supplies residential and small commercial load in the Anacostia area of Southeast Washington, D.C. New and existing 13 kV overhead feeders from Alabama Avenue Sub. 136 will be extended in order to convert all 4 kV load.

Existing Configuration: Anacostia Sub. 8 is supplied by two 34 kV feeders from Buzzard Point Station B. Converting 4 kV load from Anacostia Sub. 8 will also relieve load from Buzzard Point Station B 13 kV substation, which is approaching its firm capacity. Review of the equipment at Anacostia Substation and the 34 kV supplies indicated the need to replace all this equipment for long term reliability. Instead of rebuilding this station, conversion of the 4 kV load and transfer of the 13 kV load to Alabama Avenue Substation will allow the retirement of both the substation and supplies and improve the overall reliability of the distribution system in this area.

Proposed Configuration: Convert all 4 kV loads to 13 kV distribution feeders and retire Anacostia Sub. 8 – 4 kV.

Status: Much of the Anacostia Sub. 8 4 kV load has been converted over the past several years as part of the 23rd Street and Anacostia 4 kV conversion projects. Construction for the Anacostia 4 kV conversion project began in 2012 and about 2.4 MVA load has been converted to 13 kV. The 2021 budget for this project was $700,420 and $187,639 was spent in 2021. The work to convert the remaining 0.9 MVA to Feeders 15173 and 15178 is scheduled to be completed in 2022. Anacostia substation will be retired after all Alabama Avenue substation and distribution work has been completed. New feeders were recommended to transfer/covert all load currently supplied from the Anacostia substation to Alabama Avenue Sub. 136. All work is scheduled to be completed by the end of 2022.

Anacostia Sub. Conversion Budget:

2022 – 2026 Budget (Figures in Thousands of Dollars)

2022	2023	2024	2025	2026	Total
$248	$0	$0	$0	$0	$248

Convert load at “G” Street Sub. 28 from 4 kV to 13 kV and retire 4 kV Substation

This project relates to an extension of existing and new 13 kV feeders to convert all 4 kV load served by “G” Street Sub. 28 to 13 kV.

The “G” Street 4kV system serves mostly residential and small commercial customers in the Capitol Hill, Barney’s Circle and Navy Yard neighborhoods. The first phase of this project to convert load from portions of “G” Street Sub. 28 feeders 212, 223, 227 & 228 Street, supplying load east of 11th Street SE and south of Pennsylvania Avenue SE to new Southwest Sub. 18 – 13kV Feeders 15876 and 15877, which has been designed and released to construction and will be extended to make the first phase conversions. The next phases will consist of extending a third 13 kV feeder from Southwest Sub. 18 along with the initial two feeders to convert portion of “G” Street 4kV load north of Pennsylvania Avenue SE and South of Massachusetts Avenue SE. The remaining 4 kV load north of Massachusetts Avenue SE will be converted to Benning Sub. 7 feeders 14708 and 14152.

Existing Configuration: G Street Sub. 28, was built in 1965 and is an isolated 4kV system not connected to any other 4kV substation. The area is experiencing moderate load growth and the existing 4kV system cannot accommodate any large new business load. Furthermore, some of the 4kV Feeders have had voltage problems, and the existing conduit and cables are very old.

Therefore, an upgrade of this system is underway to eliminate potential reliability concerns proactively.

Status: Project scope and estimate was reassessed in early 2019. The project was handed over to Project Management for execution. It is currently in design. Construction anticipated to begin in late 2022. The 2021 budget for this project was $9,976,881 and approximately $2,197,379 was spent in 2021.

G Street Sub. Conversion Budget:

2022– 2026 Budget (Figures in Thousands of Dollars)

2022	2023	2024	2025	2026	Total
$12,362	$13,222	$13,214	$14,314	$17,599	$70,711

2.4 DA PROJECTS

Distribution Automation is the conversion of a manually operated distribution system with limited available status information and limited control to a system that not only is fully automated but also performs operations totally independent of any human intervention. Advancements in technologies have made these automation activities practical for the lower voltage systems and will significantly change the way the Company responds to outages and operates and restores the electric system.

Status: Refer to section 1.13 (Technology: Monitoring, Automation, and Information System) above for the status of the completed DA Projects. There were 36 feeders activated in ASR in 2021. The table below lists the feeders that were deployed in 2021. This set of feeders will primarily benefit customers in Ward 8.

Table 18: ASR Feeders Activated in 2021 with their Historical Lockout Statistics

2.5 PRIORITY FEEDER PROJECTS

These projects are included in the Feeder Improvement program.

Status: In response to the Commission's focus on preventing repeat Priority Feeders, Pepco has adjusted its feeder remediation strategy to a more comprehensive approach. Instead of focusing on locations where previous failures have occurred, the entire feeder is reviewed to address potential locations for future failures. The 2021 budget for the Priority Feeder projects was $1,832,735 and $3,684,726 was spent in 2021.

– PERFORMANCE[39]

Priority Feeders & Aggressive Initiatives

Feeder Performance and Aggressive Initiatives

Feeder Performance

[39] Order No. 16975 states the following at paragraphs 58 and 59, 60, and 105:
58. Decision: …We therefore require Pepco to provide in the 2013 Consolidated Report, the information recommended by the Staff including an explanation of any discrepancies between work planned and work completed…. In Order No. 15941, the Commission required Pepco to provide specific information regarding any 4 kV feeder that has appeared on the Priority Feeder List three times or any 13 kV feeder that has appeared on the Priority Feeder List four times. On June 13, 2012, Pepco filed a report pursuant to that Order, providing information on two 13 kV feeders, 14717 and 14768. The Commission believes it is necessary to expand the scope of Pepco's reporting on feeder improvement to include any feeder that has appeared on the priority feeder list more than twice. Therefore, we require Pepco to provide the information required in paragraph 13 of Order No. 15941 in the future Consolidated Reports for any feeder appearing more than twice on the Priority Feeder List….
59. In future Consolidated Reports, Pepco shall include the following information about each feeder on the Priority Feeder List:
(1) a detailed description of outages, including causes and corrective actions taken;
(2) the SAIDI, SAIFI, number of interruptions, and number of hours of customer interruptions for that feeder for each year beginning with the year the feeder first appeared on the Priority Feeder list;
(3) a map showing the feeder service area, including affected neighborhoods;
(4) an analysis of why past corrective actions failed;
(5) Pepco's proposed solution to the feeder's reliability problem, including an explanation of options considered with the cost/benefit analysis of each and justification for the option recommended;
(6) a cost/benefit analysis of the solution, including budget and cash flows by year, as well as any impact on the revenue requirement; and
(7) a detailed justification for its aggressive feeder remediation measure of replacing open wire secondary with triplex secondary conductor.
60. The Commission notes that in recent PIWG meetings, Pepco has indicated its intention to change the methodology which it uses to determine Priority Feeders. A change in methodology would diminish the value of the Priority Feeder List in determining historically poorly performing feeders and would lessen our ability to track and compare the historical data. Therefore, we require Pepco to provide two Priority Feeder Lists, using both the historical (CPI) and any new methodologies in the 2013, 2014 and 2015 Consolidated Reports. In addition, the Commission requires Pepco to provide the information required by paragraph 13 of Order No. 15941 for any feeder appearing more than twice on the Priority Feeder List using either the historical or any new method.
105.Pepco is DIRECTED to provide information on Priority Feeders consistent with paragraphs 58-60 herein;

Each year Pepco analyzes the performance of its feeders to determine the relative ranking of each feeder from the best to the least reliable. From this ranking, Pepco selects the least reliable two percent (2%) of its feeders (excluding the selected feeders from the prior year study) to analyze and identify actions which likely will improve the reliability of the feeders, and therefore the system.

Beginning in 2013, the Company began using the SPC (System Performance Contribution), a method that provides greater system performance improvement potential. The SPC value for each feeder is calculated using the following equation:

SPC = 75% x (Feeder CI / System CI) + 25% x (Feeder CMI / System CMI),

Where

Feeder CI = Customer Interruptions of the feeder System CI = Customer Interruptions of the total system
Feeder CMI = Customer Minutes of Interruption of the feeder System CMI = Customer Minutes of Interruption of the total system.

In addition, when selecting the annual priority feeders, the selections are made based on the combination of the following criteria:

1) Feeders blended performance ranking by SPC values (i.e., individual feeder contribution to system SAIFI and SAIDI);
2) Feeders that are not repeated from the year prior;
3) Feeders with a minimum SAIFI value of 2.00; and
4) Feeders experienced at least 10 outage occurrences in the evaluation period.

Additional analysis at the feeder level is conducted to ensure the proper feeders are selected and corrective actions are reasonable (e.g., excluding feeders with abnormal configuration at the time of the outage occurrence, when outage causes were remediated during initial outage restoration work, etc.).

Excluded from this annual study are the Priority Feeders from the prior year, which typically would not show the full results of corrective actions until a full year following the completion of the corrective actions.

As of December 2021, there are 765 feeders (4 kV and 13 kV) in the District of Columbia. Sixteen feeders represent 2% of the 765-feeder total. The sixteen 2021 Priority Feeders, along with customers served, are provided in Section 2.5, and each includes a narrative outlining the initial measures necessary to improve performance. Additional corrective actions may result from continuing analysis of the outage data and detailed engineering. These feeders originate from seven different substations.

Attachment C contains maps of the 2022 Priority Feeders. The priority feeder program will be an enhanced initiative including both reliability work routinely performed on the selection of priority feeders supplemented with more aggressive initiatives.

Cost/Benefit Discussion

Order No. 16975 requires that Pepco provide the following in this and future Consolidated Reports (paragraph 59, item 6):

(6) a cost/benefit analysis of the solution, including budget and cash flows by year 44, as well as any impact on the revenue requirement;

As described in previous ACRs, the measurement of benefits associated with feeder reliability projects generally depends on the outage history of the feeder and the likelihood that a portfolio of remediation activities will reduce or eliminate similar outages for the same or similar cause. Simply allocating a portion of the previous customer interruptions or customer minutes of interruption prior to the remediation activity is a way of qualifying the relative cost / benefit of individual remedial efforts. This is, however, not a dependable method of forecasting future feeder or aggregate system reliability because no remediation tactic is all inclusive of every possible outage cause. Likewise, this approach assumes all other inputs to system reliability are held constant (same weather, same animal events, same tree faults, etc.), which is unlikely.

Similarly, the measure and inclusion of cost/benefit per feeder or per individual initiative would potentially serve to reduce the field of options available to apply in feeder performance improvement. Some activities are not as efficient or economical as others based on a simple mathematical evaluation. However, the potential exclusion of these activities based on their relative inefficiency at the feeder or activity level would mean that the best overall portfolio of remedies could not be utilized in system level improvement. Further, with the advances in sectionalization technology, standard cost benefit analyses could drive a utility to employ only mitigation efforts rather than more appropriate but potentially more costly fault elimination tactics. Pepco evaluates each of these options and implements mitigation as well as elimination techniques when evaluating work to improve reliability of a feeder.

2.6 Aggressive Initiatives[40]

The Priority Feeder program is an enhanced initiative including both reliability work routinely performed on the selection of priority feeders supplemented with more aggressive initiatives.

Aggressive initiatives may include the following:

- Installation of tree wire in close configuration construction to replace bare wire through heavily treed areas where aggressive tree trim and standard cross-arm construction would have limited success or is restricted by ordinance or property owners.
- Installation of PAC for use as the main trunk of the feeder with the existing mainline reconfigured as fused laterals.
- Installation of automatic circuit reclosers (ACR) in loop scheme configuration to automatically sectionalize faulted sections of the feeder and provide automatic backup to unfaulted sections.
- Installation of remote operated load break switches into the loop scheme configuration with the automatic circuit reclosers.

Pepco's proposed aggressive initiatives to its underground distribution feeders are:

4 kV System

In addition to performing Very Low Frequency (VLF) testing and manhole inspections, the process of correcting identified issues also includes the following:

- Installation of tap-holes (switch points) at key locations to improve the ability to isolate problems as well as improving the ability to restore customers following each event.

- Perform a review of the failure history of the area for each failure and comparison of failure locations to replacement history. Perform proactive cable replacement of stretches that

[40] In Order No. 15152 paragraph 73, the Commission ordered the following:
73. Pepco is DIRECTED to investigate the viability of the "aggressive" initiatives for all least performing feeders, to file a progress report regarding the implementation of these initiatives where viable as part of the 2009 Consolidated Report, and to file quarterly progress reports thereafter, consistent with paragraph 62 of this Order;

In Order No. 15809 paragraph 11, the Commission ordered the following:
11. Pepco IS DIRECTED to include in its 2011 Consolidated Report a plan for development and application of "aggressive initiatives" to its underground distribution feeders;

were not previously replaced in the area.

Regarding Commission's recommendation (per Order No. 16975) to add switch points to 4kV feeders, over time these 4kV feeders will be converted to 13kV, in which the loop alternate feed design is inherent. In the interim, all of the 4kV systems have backup supply for trunk outages. And for lateral outages, Pepco is replacing cable, installing tap holes, and ultimately converting all current underground 4kV feeders to 13kV feeders.

13 kV System

In addition to performing VLF testing and manhole inspection, correcting identified issues include the following:

- Perform a review of the failure history of the area for each failure and compare failure locations to replacement history. Perform proactive cable replacement of stretches that were not previously replaced in the area.
- Replace all of the problem sections of cable.

For various reasons, not all of the "Aggressive Initiatives" are applied to each of the Priority Feeders. For example, if a particular feeder is completely underground, installing tree wire, PAC, ACR and remote operated load-break switches would not be applicable as these types of equipment are not used on underground feeders. Similarly, if a feeder is already equipped with remote switching capabilities and the switches are functioning properly, then simply increasing the number of remotely operated switches will generally not yield improvement. Further, if the predominant outage cause for a feeder is not tree-related, installing tree wire along the previous outage locations, will not yield performance improvement.

Order No. 16975 states the following at paragraph 58:

58. …In addition to the information required by paragraph 13 of Order No. 15941, the Commission also requires that Pepco provide detailed justification for its aggressive feeder remediation measure of replacing open wire secondary with triplex secondary conductor, as recommended by the OPC response.

The following is Pepco's explanation for replacing open wire secondary conductors with triplex conductors:

Triplex conductors are less susceptible to mechanical damage such as trees, winds, etc. They increase the distance between the primary and neutral conductors, which reduces the opportunity for primary related tree outages. Other miscellaneous upgrades will also be performed such as pole, hardwire, and equipment replacements due to deterioration. Upgrading will significantly reduce future equipment failures. Should damage occur, restoration is faster with the triplex conductors. Therefore, customers will experience lower number of outages as well as a shorter duration of outages. The cost to replace open wire secondary conductors with triplex conductors is approximately $40,000 per mile

2021 PRIORITY FEEDER PROGRAM

Order No. 16975 requires that Pepco provide the following in this and future Consolidated Reports (paragraph 59, item 1):

(1) a detailed description of outages, including causes and corrective actions taken:

2021 Priority Feeder Program - District of Columbia - Corrective Actions Proposed vs. Completed				
Rank	**Feeder**	**Proposed Corrective Actions, as filed in the 2021 Consolidated Report**	**Detailed Corrective Actions - Completed**	**Explanation of Variances/Comments**
	15709	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	14712	- No mainline work proposed under the 2021 Priority Feeder Program (UG Feeder)	- No Work	N/A
	14022	- Install/Replace 5,100' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 5,100' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	14758	- Install/Replace 2,100' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 2,100' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	15010	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	Work on-going. To be completed December 2022
	14900	- Install/Replace 825' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 825' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	15197	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	15001	- Install/Replace 2,300' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 2,300' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	Work on-going. To be completed December 2022
	14023	- Install/Replace 1,500' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 1,500' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	Work on-going. To be completed September 2022
	15013	- Install/Replace 2,900' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 2,900' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	14150	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	00372	- Due to work performed on this feeder under the 2020 Comprehensive Feeder Program, no work is planned on this feeder under the 2021 Priority Feeder Program	- No Work	N/A
	15166	- Install/Replace 1,300' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 1,300' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	14766	- Install/Replace 550' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 550' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	14005	- Install/Replace 4,700' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Install/Replace 4,700' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A
	14133	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.	N/A

Proposed Corrective Actions for 2022 Priority Feeders[41]

The following information provides an overview of the outages and proposed corrective actions for the 2022 Priority Feeders and detailed information regarding the equipment related events and/or outages. Please see Attachment C for maps of the 2022 Priority Feeders reflecting overhead and underground portions, and the Priority Feeders by District of Columbia Ward.

Pepco's OMS assigns event numbers based on length of time between interruptions. Therefore, during the trouble locating and restoration process, more than one event number may be generated and counted. For the sections that explain equipment failures, for mainline feeders, line fuses and transformers, the events were grouped by incidents.

2022 Priority Feeders

The following 16 feeders have been identified as priority feeders. Please note that some feeders, as stated below, will not have work performed in 2022 under the Priority Feeder program; rather, as specified below, some feeders had corrective work performed coincident with the outage(s) that caused the feeder to be a priority feeder or whose work is subsumed in another reliability program.

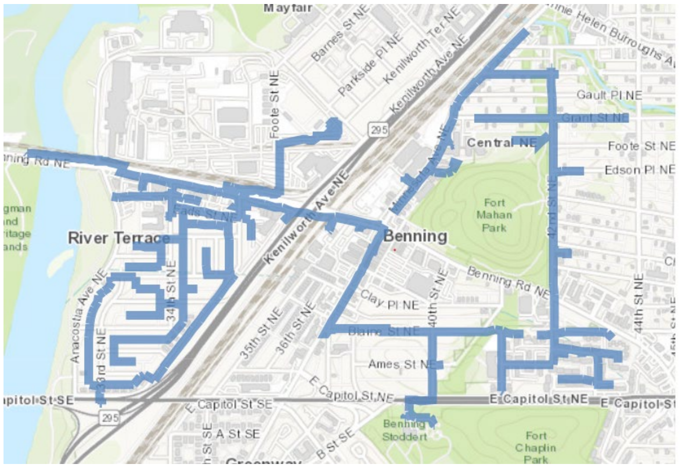
Please note that, in a change from previous years' reports, Pepco is now budgeting for the entire class of priority feeders rather than for each feeder. The 2022 budget for priority feeders is $2,285,462.[42]

Circuit: 15710

Feeder 15710				Oct.2020-Sept.2021 Reliability Indices (In Hours)			Feeder Miles			
County	Substation	Customers Served	Number of Outages	SAIFI	SAIDI	CAIDI	OH	UG	TOTAL	Repeated Last 2 Years?
DC	Benning a23013 7	2229	24	4.361	257.9	59.1	80%	20%	8.01	Y

[41] Actual equipment failures may be more or less than the number shown because a single event may give rise to more than one equipment failure and due to OMS limitations, that do not allow a single unique case to be identified in each line.
[42] The budget can be adjusted according to the needs of the program.

Feeder Map and Location:



Outage Data Summary (Past 3 years):

2019: (Oct 18-Sep 19) Ninety-eight percent (98%) of customer outages were due to 3 mainline outage events; 2 events were caused by Motor Vehicle, and 1 event was caused by Unknown. Zero customer outages occurred due to lateral events this year.

2020: (Oct 19-Sep 20) Eighty-four percent (84%) of customer outages were due to 1 mainline outage event; the event was caused by Animal/Bird. Zero customer outages occurred due to lateral events this year.

2021: (Oct 20-Sep 21) Ninety-seven percent (97%) of customer outages were due to 10 mainline outage events; 4 events were caused by Equipment Failure, 5 events were caused by Foreign Contact, and 1 event was caused by Tree ROW – Limb. One percent (1%) of customer outages were due to 2 lateral events; 1 event was caused by Foreign Contact, and 1 event was caused by Tree ROW – Limb.

Feeder Performance (Oct 20-Sep 21)

Outage Cause by SAIFI	SAIFI	% of Feeder
Equipment Failure	2.237	51%
Foreign Contact	1.480	34%
Tree ROW - Limb	0.626	14%
Animal/Squirrel	0.009	<1%
Animal/Bird	0.009	<1%

Outage Cause by SAIFI	SAIFI	% of Feeder
Unknown	0.000	<1%

Field Observations:

Feeder 15710 serves approximately 2,229 customers in the NE Benning area of Washington D.C. The feeder is a mix of commercial and residential services and is 80% overhead and 20% underground. The mainline portion of the feeder runs underground from the Benning Substation onto Benning Rd NE, where it transitions to overhead and proceeds to east southeast along Benning Rd NE. After the feeder crosses the railroad tracks it switches back to underground before Minnesota Ave NE. Once the feeder reaches Blaine St NE, it turns to the east. After a short distance on Blaine St NE, the circuit switches back to overhead and continues. An overhead lateral goes south at 40th St NE feeding residential areas. The mainline turns north onto 42nd St NE with several laterals coming off. The feeder continues north until Hayes St NE where it goes east then southeast at Minnesota Ave. A short lateral also travels north from there. The feeder continues and ends at the intersection of Minnesota Ave NE and Benning Rd NE.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

- Create WOs to address Animal issues at equipment locations

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies will help to improve the resiliency of the feeder, thereby supplying a more reliable service to customers served by this feeder.

Circuit: 14713

County	Substation	Customers Served	Number of Outages	Oct. 2020-Sept. 2021 Reliability Indices (In Hours)			Feeder Miles			Repeated Last 2 Years?

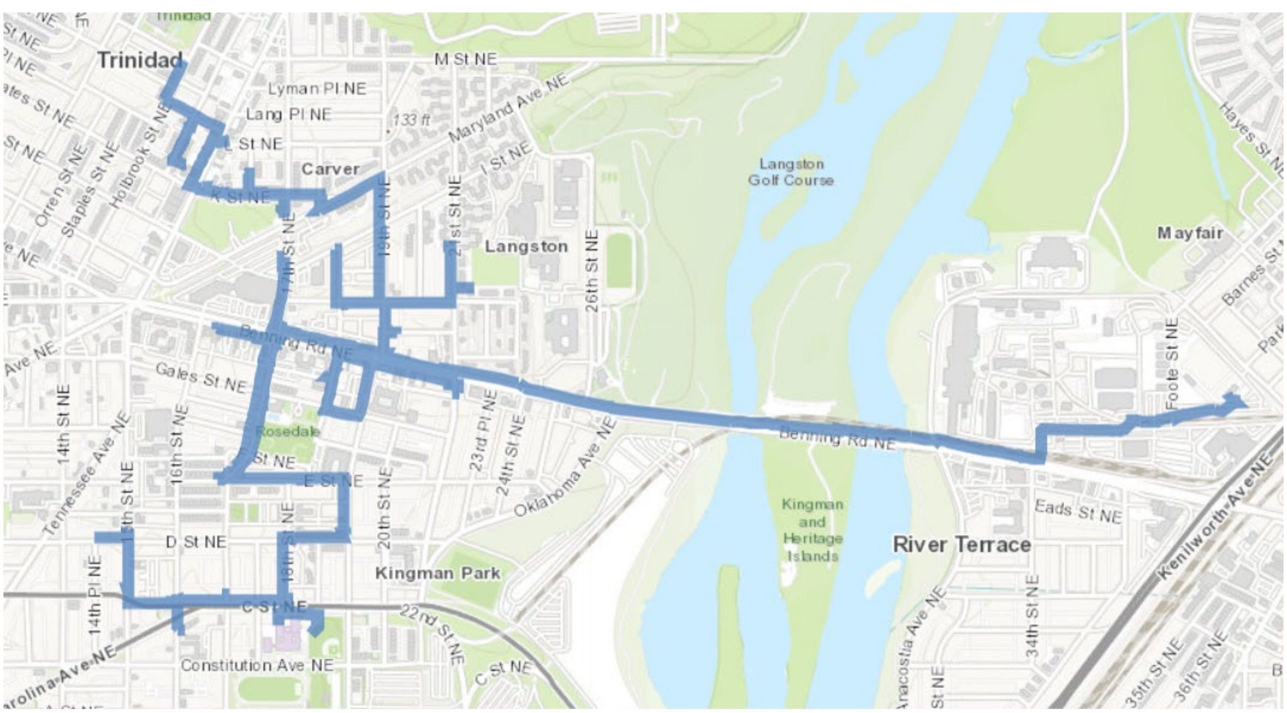
Feeder Map and Location:



Outage Data Summary (Past 3 years):

2019: (Oct 18-Sep 19) One hundred percent (100%) of customer outages were due to 3 mainline events; 3 events were caused by Equipment Failure. Zero customer outages occurred due to lateral events this year.

2020: (Oct 19-Sep 20) Ninety-one percent (91%) of customer outages were due to 4 mainline events; 4 events were caused by Unknown. Nine percent (9%) of customer outages were due to 2 lateral events; 1 event was caused by Animal/Bird, and 1 event was caused by Cable Cut – Unknown.

2021: (Oct 20-Sep 21) Eighty-three (83%) of customer outages were due to 9 mainline events; 6 events were caused by Equipment Failure, and 3 events were caused by Unknown. Sixteen percent (16%) of customer outages were due to 4 lateral events; 4 events were caused by Equipment Failure.

Feeder Performance (Oct 20-Sep 21)

Outage Cause by SAIFI	SAIFI	% of Feeder
Equipment Failure	3.267	96%
Unknown	0.118	3%
Cable Cut - Billable	0.002	<1%

Field Observations:

Feeder 14713 serves approximately 2,123 customers in NE Washington, DC. This feeder is 100% underground construction and feeds both residential and commercial customers. The feeder goes west on Benning Rd NE and after crossing the bridge over the Anacostia River on Benning Rd NE, this circuit feeds many residential neighborhoods and commercial businesses to the north and south of Benning Rd NE, with its westernmost boundaries being Holbrook St NE and 14th Pl NE.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

- This feeder will be investigated through underground inspection programs separate from the priority feeder projects to determine the appropriate improvement measures are taken on this circuit.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

Further investigation into the conditions on this feeder that can be optimized to improve customer reliability will reduce outages and feeder resiliency.

Animal/Squirrel	0.008	<1%
Load	0.000	<1%
Unknown	0.000	<1%

Field Observations:

Feeder 15173 serves approximately 2,019 customers in the Naylor Gardens and Garfield Heights neighborhoods in SE Washington D.C. The mainline portion of this feeder comes out of the substation on 15th St SE and goes south as underground until just after it turns northeast onto Mississippi Ave SE where it becomes overhead. The mainline continues until Southern Ave SE where it continues to go northeast. The line then continues into the cul-de-sac on Savannah St SE to continue west until it turns north onto 23rd St SE. 23rd St SE continues on a curve that takes it to a northwest direction. A lateral goes west at the intersection of Alabama Ave SE while the mainline continues east then north onto 24th St SE. The circuit continues going north by turning west onto Irving St SE then onto 23rd ST SE, onto Hartford St SE, then north on Langston Pl SE. The line continues and turns onto Raynolds Pl SE and another split continuing onward moving to Alabama Ave SE where it continues to move through the Naylor Gardens neighborhood.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

- Address guying at pole locations where current equipment has been identified in deteriorated condition.

- Set four new poles throughout the circuit where the feeder transitions from overhead to underground, relocating one of the UG feeds to the new poles, greatly reducing chances of outages on the full UG loop that result from the riser pole.

Milestones/Schedule:

Work on this feeder will require approximately 3 months to be completed.

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The miscellaneous maintenance items to be addressed on this feeder will provide continued safety and security of Pepco's facilities on the overhead portion of this circuit. Additionally, the relocation of overhead to underground transition points to new poles will result in the lessened probability of outages throughout an entire URD loop. Therefore, customers will be served by more reliable feeds with mitigated risk of issues at a pole causing widespread disturbances on the underground portions of the feeder.

Circuit: 14014

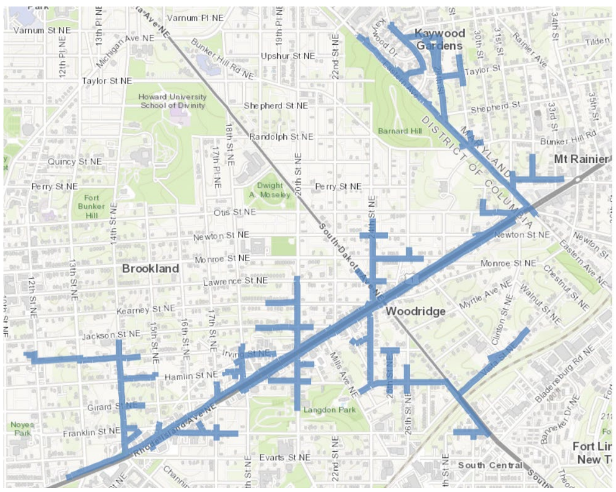
<u>Feeder Map and Location:</u>



<u>Outage Data Summary (Past 3 years)</u>:

2019: (Oct 18-Sep 19) Ninety-nine percent (98%) of customer outages were due to 1 mainline event; 1 event was caused by Load. Zero customer outages occurred due to lateral events.

2020: (Oct 19-Sep 20) Eighty-four percent (84%) of customer outages were due to 5 lateral events; 1 event was caused by Animal/Other, 1 event was caused by Employee, 2 events were caused by Unknown, and 1 event was caused by Weather / Lightning. Zero customer outages occurred due to mainline events.

2021: (Oct 20-Sep 21) Eighty-six percent (86%) of customer outages were due to 5 mainline events; 1 event was caused by Equipment Failure, 1 event was caused by Foreign Contact, 1 event was caused by Unknown, and 2 events were caused by Weather / Wind. Twelve percent (12%) of customer outages were due to 5 lateral events; 1 event was caused by Animal/Squirrel, 1 event was caused by Equipment Failure, 2 events were caused by Foreign Contact, and 1 event was caused by Unknown.

Outage Cause by SAIFI	SAIFI	% of Feeder
Unknown	1.040	55%
Equipment Failure	0.402	22%
Foreign Contact	0.310	17%
Animal/Squirrel	0.077	4%
Weather / Wind	0.024	1%
Tree Row - Down	0.008	<1%
Tree ROW - Limb	0.007	<1%

Field Observations:

Feeder 14014 serves approximately 2,074 customers in NE Washington D.C. The feeder comes out onto Irving St NE east until 14th St NE then heads south until it intersects with Rhode Island Ave NE, heading to the northeast. The circuit keeps this path until it reaches Eastern Ave NE where it travels northwest until the feeder ends at an open recloser. The laterals along this main line are fused well but there are a handful of items that can be installed/replaced to improve reliability.

Previous Actions Taken (Past 3 years):

2018 ACR FDR 14014/14297- 12KA N.O. ACR

- Install 12KA NO ACR

Planned Remediation (Current Year):

- Create WO to address Animal issue at twenty-two (22) equipment locations
- Replace lightning arrestors at three (3) locations
- Install fuse for lateral tap at 810401-380650
- Replace guying at one (1) location
- Reconductor ~2,416’ of existing #2 Copper wire with 477 ACSR Treewire
    - Between 809402-350240 & 807403-620940 on Eastern Ave NE

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder, thereby supplying a more reliable service to customers served by this feeder. The reconductoring effort along Eastern Ave NE will increase the reliability of the feeder by installing a conductor that can perform more robustly to accommodate current load and growing needs for the future.

Circuit: 15085

Feeder 15085 serves approximately 1,588 customers in the Glassmanor and Washington Highlands neighborhoods in Oxon Hill, MD and SE Washington D.C. The mainline portion of the feeder originates out of the St. Barnabas Substation. The feed travels along Saint Barnabas Rd, Wheeler Rd, and Owens Rd in Maryland. It then gets to Southern Ave SE and travels along the Maryland side of the street until it reaches Wheeler Rd/SE and switches sides. The lateral continues through Wheeler Rd SE and Bellevue Rd SE on the DC side and the mainline continues going northeast on Southern Ave SE. The feeder ends at a riser pole along Southern Ave SE. The mainline is all overhead while some of the laterals come off as underground.

Previous Actions Taken (Past 3 years):

Reconductor feeder 15085 & 15086 in breaker zone

- Remove 1500' of 3-1/0 ACSR from FDR(s) 15085 & 15086. Remove 815' 2-#2 CU PE secondary mainline from FDR 15086. Install 1500' of 3-477 ACSR tree wire on FDR(s) 15085 & 15086. Install 815' 4/0 triplex secondary mainline.

Arbor View Apts – Replace OH PRI/XMRs w/ URD PRI/PDMT XFMRs

Planned Remediation (Current Year):

- Create WO# to address animal issues at equipment locations
- Create WO# Replace guying at specified locations
- Create WO# Install flash guard at specified locations
- Reconductor ~936' of existing #4 Copper wire with 1/0 ACSR
    - 808358-25028 – B phase lateral on Norlinda Ave & Norlinda Pl

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder and the reconductoring effort will provide greater reliability through newer facilities in this area of the circuit.

Circuit: 15018

Feeder 15018 serves approximately 1,943 customers in the Michigan Park and North Michigan Park neighborhoods in NE Washington D.C. The mainline portion of this feeder originates out of the Ft Slocum Substation and runs southeast underground down Blair Rd NW. Once it reaches Kennedy St NE it runs east and transitions to overhead. The line continues east to South Dakota Ave NE where it becomes underground again. The feeder then changes back to overhead at the recloser just before the Gallatin St NE intersection. The feed then goes onto 12th St NE briefly to turn west onto Buchanan St NE. The mainline turns west onto Decatur St NE until the line ends near Puerto Rico Ave NE.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

- Create WO to address Animal issue at nineteen (19) equipment locations
- Replace crossarms at five (5) locations
- Replace guying at four (4) locations
- Replace two-point brackets at seven (7) locations
- Install fuses for lateral taps at two (2) locations
- Replace pole & equipment at 801405-370830
- Re-stencil pole at two (2) locations
- Vegetation Management to perform tree trimming on feeder
- Create design for one (1) double riser locations to relocate one set of UG cables to a new pole set to split risers for UG loop

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder. Installing new fuses at poles that transition between mainline and lateral will further increase the ability to sectionalize the circuit to isolate outages and protect the mainline, and the separation of underground feeds from the same pole will reduce risk of an entire URD loop experiencing a disturbance after an event at one pole.

Animal/Bird	0.004	<1%
Unknown	0.003	<1%
Equipment Failure	0.002	<1%
Vandalism	0.001	<1%

Field Observations:

Feeder 15171 serves approximately 1,790 customers in the Congress Heights, Douglass, and Shipley neighborhoods in SE Washington D.C. The mainline portion of the feeder originates out of the Alabama Ave Substation and runs along 15th St SE, Savannah Dr SE, Mississippi Ave SE, and Southern Ave SE. The feeder services mostly residential and some commercial customers. The feeder has a mix of old and new construction with existing copper wire still in place.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

- Create WO# to address to re-attach 3 Phase Primary to pole

- Create WO# to Install Spacers around poles 806367-630980, 809369-340460 & 808369-540530
- Need load study performed on padmount transformer 807368-030030 to determine customers for upgrade
- Reconductor ~822' of existing 1/0 Copper wire with 477 ACSR
  - Between 804367-830180 & 805367-561568 on Mississippi Ave
- Create design for seven (7) double riser locations to relocate one set of UG cables to a new pole set to split risers for UG loop

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	TBD	TBD
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder. Installing phase spacers will reduce outages caused by conductor contact due to wind or tree events. The reconductoring effort on this feeder will increase the reliability of the feeder with newer, more durable conductor. The separation of multiple underground feeds from the same pole will reduce risk of an entire URD loop experiencing a disturbance after an event at one pole.

Outage Data Summary (Past 3 years):

2019: (Oct 18-Sep 19) Ninety-one percent (91%) of customer outages were due to 16 mainline events; 16 events were caused by Equipment Failure. Six percent (6%) of customer outages were due to 3 lateral events; 3 events were caused by Equipment Failure.

2020: (Oct 19-Sep 20) Thirty-three percent (33%) of customer outages were due to 1 lateral event; 1 event was caused by Unknown. Zero customer outages occurred due to mainline events this year.

2021: (Oct 20-Sep 21) Eighty-seven percent (87%) of customer outages were due to 2 mainline events; 2 events were caused by Equipment Failure. Two percent (2%) of customer outages were due to 1 lateral event; 1 event was caused by Equipment Failure.

Feeder Performance (Oct 20-Sep 21)

FEEDER	Outage Cause by SAIFI	SAIFI	% of Feeder
16003	Equipment Failure	1.915	100%

Field Observations:

Feeder 16003 originates from the Waterfront substation in northwest Washington, DC, and serves approximately 1,851 customers. The feeder is 100% underground and provides power to both residential and commercial customers. The mainline emerges from the substation along Q St SW where the feeder runs east, then turning south to 13th St SW the mainline trunk changes direction to the northeast on Potomac Ave SW/SE until a bend where the road changes to 1st St SE where it runs north. It then turns west onto N St SE then turns north onto South Capital St SE. The mainline trunk of the feeder continues in this manner along South Capital St SE until the mainline trunk turns northwest onto Canal St SW. At the intersection of Canal St SW and C St SW the feeder has laterals to the west and north but the mainline continues east onto C St SW. The mainline then does a loop from going down 1st St SE to North Carolina Ave SE where it is fused off then travels back north to C St SE and continues east. The feeder continues eastward by turning onto 4th St SE and then Seward Sq SE then southwest onto Pennsylvania Ave SE where splits and went south down 6th ST SE as well but continues on Pennsylvania Ave SE and ends at 7th St SE.

Previous Actions Taken (Past 3 years):

Waterfront Switch Replacement – FDR 16003 – 800382-381197

Switch Replacement – FDR 16003 – 499 6th St SE, DC

- Remove existing 3-way switch on FDR 16003. Install NEW 4-way switch and 6x16' MH FDR 16003. Reconductor 15871, 16002, & 16003 to 3-600 1/c F.S. Reconductor 16003 mains from NEW switch to existing tapholes

Replace RL Sec with RN Sec Cable – Bundle 6 Ontario Rd

- Replace approximately 800ft of 250RL cable w/ 250RN cable

Planned Remediation (Current Year):

- This feeder will be investigated through underground inspection programs separate from the priority feeder projects to determine the appropriate improvement measures are taken on this circuit.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments				

Completed Remediation Work: N/A

Anticipated Benefits:

Further investigation into the conditions on this feeder that can be optimized to improve customer reliability will reduce outages and feeder resiliency.

Feeder 14717 serves approximately 1,562 customers in Northeast Washington D.C. Originating from the Benning Substation; this circuit is 74% overhead and 26% underground. The mainline provides both residential and commercial service. The feeder comes out on Foote St NE and onto Kenilworth Ter NE where it travels northeast. It turns southeast onto Jay St NE, then northeast onto Kenilworth Ave NE. The feeder ends near the intersection of R St NE and Eastern Ave NE.

Previous Actions Taken (Past 3 years):

Benning Area Plan Feeder 14717

- Extend PAC on feeder 14717 from sub to switch – Benning area

2017 Benning Area Plan Feeder 14717 ML-1

2018 Benning Area Plan Feeder 14717 PAC Install

Move Pole on Kennilworth and Pole St NE

- Move pole 5 feet north

Install Normally Closed Switch Feeder 15711

2018 ACR Program – Install ACR on Feeder 14717

- Install a new 12kA ACR on pole 818391-163973

Planned Remediation (Current Year):

- Create WOs to address Animal issues at equipment locations
- Create design for five (5) double riser locations to relocate one set of UG cables to a new pole set to split risers for UG loop

Milestones/Schedule:

Unknown	0.001	<1%

Field Observations:

Feeder 15204W serves approximately 1,109 customers in Northwest Washington D.C. Originating from the 10th St, DC Substation; all of this circuit consists of underground construction (100% underground construction). The mainline provides both residential and commercial service. The mainline emerges from the substation on L St NW and heads east to the nearest intersection. It then moves north up 10th St NW. The feeder then continues on N St NW to the east until it reaches 77th St NW to go north. At the intersection of 77th St NW and P St NW the feeder branches into all directions with laterals to feed commercial and residential services. The devices and conductor on this feeder are generally in good condition, however there are outage locations at manholes.

Previous Actions Taken (Past 3 years):

No work performed within the last 3 years.

Planned Remediation (Current Year):

- This feeder will be investigated through underground inspection programs separate from the priority feeder projects to determine the appropriate improvement measures are taken on this circuit.

Feeder 14767 serves approximately 969 customers in northwest Washington D.C. Originating from the Little Falls Substation; this circuit provides service to both commercial and residential customers, but mostly residential. This feeder is largely overhead (77% overhead and 23% underground) and emerges from the substation along MacArthur Blvd NW and travels southeast. After fused laterals and a recloser the overhead mainline reaches Ashby St NW where it continues east and then south on 49th St NW. The line continues onto W St NW and ends at the intersection with Foxhall Rd NW.

Previous Actions Taken (Past 3 years):

2018 Reliability Engineering FDR 14767 Reconductor w/ 477 TW & Paving Task

- Replace 4/0 ACSR bare with 477 ACSR TW and 477 AAC spacer cable

Feeder 14767 – 2017 Priority Feeder – XFMR #500920

- Heavy-up transformer to properly handle existing load, 50kva to 100kva

Planned Remediation (Current Year):

- Create WO to address Animal issues at six (6) equipment locations
- Vegetation Management to perform tree trimming on feeder
- Replace poles at four (4) locations if not being replaced under current WO#
- Re-stencil pole 773399-680450
- Replace transformer at 771398-520360
- Replace fuses at 771398-480030
- Replace crossarm at two (2) locations
- Create design for six (6) double riser locations to relocate one set of UG cables to a new pole set to split risers for UG loop

Additional Comments – All other outage reports issues have been addressed in the field.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A

Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder. Addressing aging infrastructure with pole, crossarm, and equipment replacements will mitigate potential for equipment related outages, and the separation of multiple underground feeds from the same pole will reduce risk of an entire URD loop experiencing a disturbance after an event at one pole.

<u>Outage Data Summary (Past 3 years)</u>:

2019: (Oct 18-Sep 19) No customer outages due to mainline or lateral events occurred during this year.

2020: (Oct 19 - Sep 20) No customer outages due to mainline or lateral events occurred during this year.

2021: (Oct 20 - Sep 21) Sixty-four percent (64%) of customer outages were due to 1 mainline event; 1 event was caused by Equipment Failure. Twenty-seven percent (27%) of customer outages were due to 3 lateral events; 3 events were caused by Equipment Failure,

Feeder Performance (Oct 20 - Sep 21)

Outage Cause by SAIFI	SAIFI	% of Feeder
Equipment Failure	1.329	>99%
Source Lost	0.001	<1%

Field Observations:

Feeder 15002 serves approximately 1,033 customers in northwest Washington D.C. Originating from the Ft. Slocum Substation. All of this circuit consists of underground construction (100% underground). The feeder comes out from the substation onto Blair Rd NW and travels northwest onto North Dakota Ave NW then west onto Peabody St NW. Once the line reaches 9th St NW it continues south until the road merges onto Georgia Ave NW. The mainline then turns onto New Hampshire Ave NW towards the southwest. It then turns south onto Sherman Ave NW then east onto Hobart Pl NW. From here it begins servicing customers on Hobart Pl NW, Georgia Ave NW, Warder St NW, Irving St NW, and Kenyon St NW. These are a mix of residential and commercial services.

Previous Actions Taken (Past 3 years):

No work has taken place on this feeder in the previous three years.

Planned Remediation (Current Year):

- This feeder will be investigated through underground inspection programs separate from the priority feeder projects to determine the appropriate improvement measures are taken on this circuit.

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments				

Completed Remediation Work: N/A

Anticipated Benefits:

Further investigation into the conditions on this feeder that can be optimized to improve customer reliability will reduce outages and feeder resiliency.

Field Observations:

Feeder 00118 serves approximately 491 customers in southeast Washington D.C. Originating from the Randle Highlands substation, most of this circuit consists of mostly overhead construction (97% overhead, 3% underground). The line comes out onto G St SE and immediately turns onto Fairlawn Ave SE to travel southeast. It then turns southeast onto N St SE then south onto 28th St SE. It turns southeast onto Pennsylvania Ave SE. Eventually the feeder turns NE onto Alabama Ave SE and eventually ends at Ft. Davis substations at a circuit breaker.

Previous Actions Taken (Past 3 years):

FDR 00118 Install 12.5 KA ACR Line NC

Planned Remediation (Current Year):

- Create WO# to replace broken/damaged crossarms at specified locations
- Create WO# to Re-stencil pole facility ID's at specified locations
- Create WO# to replace padmount in pad condition at 813376-110330

Milestones/Schedule:

Tree Row - Down	0.035	<1%
Tree ROW - Limb	0.004	<1%

Field Observations:

Feeder 00144 serves approximately 283 customers in northwest Washington D.C. Originating from the Westmoreland substation, most of this circuit consists of overhead construction (41% underground, and 59% overhead). The feeder comes out from the substation on Western Ave NW traveling north very briefly then east onto Brandywine St NW. The mainline continues south onto 49th St NW until it reaches Massachusetts Ave NW where it goes underground until before the road intersects with Fordham Rd NW. The line travels east onto Tilden St NW going underground again until it comes up at a recloser near Loughboro Rd NW and Glenbrook Rd NW. The mainline continues with laterals along the way to Palisades substation at a circuit breaker.

Previous Actions Taken (Past 3 years):

DC Plug Feeder 00308 – Relocate Feeders 00144 and 00394

Planned Remediation (Current Year):

- Create WO to address Animal issues at three (3) equipment locations
- Replace pole at 770400-340650
- Replace transformer at 771402-080400

- Reconductor ~166' of OW secondary to triplex (12 splices in span)
  - Between 769400-700230 & 769400-560140 on Macomb St

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder. Addressing aging infrastructure with pole and equipment replacements will mitigate potential for equipment related outages, and the reconductoring of heavily spliced conductors will resolve outage concerns to provide more reliable service to customers in that area.

Tree Outside ROW - Down	0.153	12%
Equipment Failure	0.101	8%
Tree ROW - Limb	0.014	1%
Animal/Squirrel	0.001	<1%

Field Observations:

Feeder 14132 serves approximately 1,097 customers in northwest Washington D.C. Originating from the Van Ness substation, the circuit construction is almost even (52% underground, and 48% overhead). The mainline emerges along Nebraska Ave NW and heads directly southwest, then turns and goes southeast on New Mexico Ave NW. It services customers near this intersection and then continues and services more customers to the south of where New Mexico Ave NW ends

Previous Actions Taken (Past 3 years):

No work is performed within the 3 years.

Planned Remediation (Current Year):

- Create WOs to address Animal issues at seven (7) equipment locations
- Replace guying at 773400-590790
- Vegetation Management to perform tree trimming on feeder
- Reconductor ~488’ of existing 3-1/0 AL wire & OW secondary with 3-1/0 ACSR wire & triplex
  - Between 77440-050990 & 773400-590790 on Rockwood Pkwy
- Reconductor ~504’ of existing OW secondary with triplex
  - Between 774399-030810 & 774399-540810 on Klingle St
- Install guying at 776397-770430(Easement may be required)
- Replace pole 777396-120370

Milestones/Schedule:

Tree Row - Down	0.308	12%
Tree Outside ROW - Down	0.195	7%
Foreign Contact	0.002	<1%

Field Observations:

Feeder 14146 serves approximately 449 customers in northwest Washington D.C. Originating from the Van Ness substation, the majority of this circuit consists of overhead construction (48% underground, and 52% overhead). It is services mostly residential customers but also has commercial services. There are also several embassies on this feeder. The mainline runs along Cleveland Ave NW, 29th St NW, Garfield St NW, Cathedral Ave NW, Connecticut Ave NW, and Rodman St NW.

Previous Actions Taken (Past 3 years):

2018 ACR FDR 14146 - 12kA N.C. ACR

- Install NC ACR 12kA

Planned Remediation (Current Year):

- Create WO to address Animal issues at ten (10) equipment locations
- Replace fuse at 782397-230450
- Replace Lightning Arrestors at 782396-880870
- Replace crossarm brace at 783395-620780

- Replace crossarm & secondary bracket at 782396-150840
- Vegetation Management to perform tree trimming on feeder
- Replace poles at two (2) locations
- Create design for one (1) double riser locations to relocate one set of UG cables to a new pole set to split risers for UG loop

Milestones/Schedule:

	Design Complete	Permitting Complete	Release to Construction	Construction Complete
Proposed	N/A	N/A	N/A	N/A
Actual	N/A	N/A	N/A	N/A
Variance Comments	N/A	N/A	N/A	N/A

Completed Remediation Work: N/A

Anticipated Benefits:

The work on this feeder to address animal/BIL deficiencies and other miscellaneous maintenance items will help to improve the resiliency of the feeder. Addressing aging infrastructure with pole and equipment replacements will mitigate potential for equipment related outages, and the separation of underground feeds from one pole to multiple poles will reduce the chance of an outage on the entire URD feed due to an incident at the cable pole.

Review of 2020 Priority Feeder Program (Least Reliable Feeders)

Activities conducted to improve the performance of each of the feeders in the 2020 Priority Feeder Program are identified in Table 19.

Table 19

2020 2% Priority Feeder Program - District of Columbia - Completed Corrective Actions							
Rank	Feeder ID	Substation	Category		SPC Value	Completion Time	Corrective Actions
			OH	UG			
1	16003	Waterfront (223)	0%	100%	0.056	N/A	No corrective actions performed under the 2020 Priority Feeder Program. However, work was performed under miscellaneous program in Q3 2021 and the PILC replacement program in Q1 2022.
2	15094	Bladensburg (175)	39%	61%	0.051	N/A	No corrective actions performed under the 2020 Priority Feeder Program due to ongoing work taking place under the Ft. Lincoln reliability improvement initiative.
3	15707	Benning (7)	91%	9%	0.044	1st Quarter 2021	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
4	15015	Ft. Slocum (190)	59%	41%	0.030	1st Quarter 2021	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
5	16002	Waterfront (223)	0%	100%	0.028	N/A	No corrective actions performed under the 2020 Priority Feeder Program. However, work was performed under the PILC replacement program in Q3 2021.
6	15021	Ft. Slocum (190)	93%	7%	0.025	3rd Quarter 2020	- Install/Replace 4200' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
7	15702	Benning (7)	5%	95%	0.023	3rd Quarter 2020	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
8	15710	Benning (7)	79%	21%	0.023	1st Quarter 2021	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
9	15130	Walker Mill (15)	68%	32%	0.022	3rd Quarter 2020	- Install/Replace 1700' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
10	14261	Beech Road (159)	92%	8%	0.022	4th Quarter 2020	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
11	14711	Benning (7)	7%	93%	0.017	1st Quarter 2021	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
12	15867	Van Ness (129)	42%	58%	0.013	1st Quarter 2021	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
13	14136	Van Ness (129)	24%	76%	0.013	1st Quarter 2021	- Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
14	00211	G Street (28)	0%	100%	0.013	N/A	No corrective actions performed under the 2020 Priority Feeder Program due to ongoing work taking place under the G Street Conversion Plan.
15	00328	Ft. Dupont	97%	3%	0.011	1st Quarter 2021	- Install/Replace 4 Poles - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.
16	14035	Suitland (134)	80%	20%	0.010	2nd Quarter 2022	- Install/Replace 1050' of Primary Wire - Miscellaneous upgrades such as fuse cutouts, animal guards, lightning arrestors, crossarms, missing grounds, uninsulated downguys, etc.

Aggressive Correction Action Program[43]

2.7 Annual Program for Repeat Priority Feeders

The review of the 16 feeders selected for the 2% Priority Feeder initiative with previous year selections show that two feeders (15710 and 16003) which were in the 2020 Priority Feeder Program reappeared on the 2022 Priority Feeder Program. When a feeder repeats, additional aggressive corrective actions are implemented. All of the corrective actions listed will be completed in 2022.

RELIABILITY STATISTICS*

Service Reliability Indices

SAIDI, SAIFI, and CAIDI are the specific indices used and provide information about both the duration and frequency of outages for customers. These indices are described as follows:

SAIDI - System Average Interruption Duration Index. Designed to provide information about the average time (in aggregate) that the customers served in a predefined area are interrupted.

SAIFI - System Average Interruption Frequency Index. Designed to give information about the average frequency of sustained interruptions per customer served in a predefined area.

CAIDI - Customer Average Interruption Duration Index. Designed to provide information about the average time required to restore service to the average customer experiencing a sustained interruption.

Each index is calculated several times, once with all outage data and then according to the specific significant event exclusions specified. The expectation is that the indices calculated with significant event related outage data excluded will provide a reflection of system performance under normal operating conditions. The indices calculated with all outage data will provide a reflection of the impact of significant events on the system. It is important to note that a year-to-year comparison of reliability indices calculated with all outage data would not be appropriate. The indices during a

[43] In Order No. 15152 issued on Pepco's 2008 Consolidated Report, the Commission stated (at paragraph 72):

72. PEPCO is DIRECTED, beginning with the 2009 Consolidated Report, to identify the feeders that are part of the separate annual program of corrective actions for reappearing least reliable feeders, describe the corrective actions planned for each feeder and the projected dates for completion of the corrective actions and explain whether the corrective actions improved the performance of these feeders consistent with paragraph 59 of this Order.

year in which major storms or events impact an electric utility will be substantially different from the indices during a year in which no such issues arise.

Service Outage Statistics [44][45]

Presented in Table 20 and 21 are the SAIDI, SAIFI and CAIDI values for the past five years at IEEE- 2.5 Beta Criteria. These reliability indices are provided for all sustained interruptions and all sustained interruptions excluding major events. A sustained interruption is defined as an interruption of five (5) minutes or greater. Table 20 shows performance indices including and excluding PEPCO major event days. Table 21 shows performance indices including and excluding District of Columbia major event days only.

---

[44] In Order No. 16623 paragraphs 48, 62 and 63, the Commission stated the following:
48. …Therefore, we hereby require that Pepco include reliability calculations using District of Columbia-only data and relying on a Major Service Outage exclusion in the 2012 Consolidated Report and in future Consolidated Reports. We also require that Pepco include in its 2012 Consolidated Report a revised version of its reliability calculations from the 2010 and 2011 Consolidated Reports using D.C.-only data and excluding Major Service Outages. Pepco shall also include calculations of reliability indices for the entire Pepco system using system-wide data and Major Event Day exclusions, as well as reliability indices for Pepco D.C. using D.C.- only MEDs in the 2012 Consolidated Report and in future Consolidated Reports, so that we may make comparisons. For purposes of this requirement, the "reliability calculations" contained in the Consolidated Report include all calculations of SAIDI, SAIFI and CAIDI, discussion of failure rate data, and selection of Priority Feeders. (Footnote: Because the Aggressive Corrective Action Program requires the identification of feeders that have been listed as Priority Feeders in the past using system-wide, MED-excluding data, we will allow Pepco to continue to select ACAP feeders using that data. However, we require that a list of Priority Feeders using the new method of calculation be included in the 2012 Consolidated Report.)
62. Pepco is DIRECTED to include in the 2012 Consolidated Report reliability calculations using District of Columbia-only data and excluding Major Service Outages consistent with paragraph 48;
63. Pepco is DIRECTED to include in the 2012 Consolidated Report a revised version of the reliability calculations contained in the 2010 and 2011 Consolidated Report using District of Columbia-only data and excluding Major Service Outages consistent with paragraph 48

[45] In Order No. 16700 issued February 12, 2012, paragraphs 10 and 11, the Commission stated:
10. In establishing out new reliability performance standards, we decided that Pepco should be given a reasonable amount of time to "ramp up" to our new requirements. Therefore, we made the new SAIDI and SAIFI standards effective beginning in 2013. By replacing the prior rule with a new one, and giving Pepco a transition period, we created a "gap" in reliability measures. We saw no harm in a temporary suspension of reliability benchmarks, recognizing that the standards in effect for 2013 through 2020 would require significant improvement on Pepco's part, starting at once. For example, in order to meet our 2013 SAIDI target, Pepco must make either about a 9% improvement in both 2012 and 2013 or about an 18% improvement in 2013. Therefore, we saw no risk that Pepco would suffer a significant "backslide" in reliability because there were no effective standards in place for 2011 or 2012.
11. We do not believe that reestablishment (for the years 2011 and 2012) of the standards to which Pepco was previously held is necessary. (Footnote: We note that not all states have Electric Quality of Service Standards. For example, Pepco presently operates in Maryland without standards but is required to provide annual reliability indices pursuant to COMAR 20.50.07.06.) Nor has Pepco provided any reason for that reestablishment. Consequently, we decline to make the clarification that Pepco requests. However, we do expect that Pepco will continue to report on its reliability performance in its annual Consolidated Report and we concur with OPC in its suggestion that Pepco coordinate its data reporting so that Pepco calculations are a consistent "apples to apples" comparison from 2011 through 2013 and beyond. Therefore, as OPC has requested, we require Pepco to include in its annual report a description of its performance and a calculation of whether it would have met the appropriate SAIFI, SAIDI and CAIDI standards had they been in effect.
14. Pepco shall include in its 2012 and 2013 annual Consolidated Reports calculations of SAIDI, SAIFI, and CAIDI as described in paragraph 11.

Table 20 Pepco System Indices 2017-2021

Pepco System Indices 2017-2021 2.5 Beta (MED Exclusive - IEEE 1366-2012 Std, Pepco System Wide Based)

Order No. 16975 states the following at paragraphs 62 and 106:

*62. **Decision:** The Commission directs Pepco to provide SAIDI and SAIFI statistics in the future Consolidated Reports calculated by both including and excluding cross- border feeders. Pepco shall identify which feeders it treats as "cross-border" for this purpose.*

*106. Pepco is **DIRECTED** to provide SAIDI and SAIFI information consistent with paragraph 62 herein;*

Table 24 District of Columbia Reliability Inclusive and Exclusive of Cross-Border Feeders (2021)

2021 IEEE MED Exclusive		
District of Columbia Reliability Statistics	SAIFI	SAIDI (Hours)
Excluding all cross-border feeders	0.33	0.57
Including all cross-border feeders	0.49	0.79

2021 DC MSO (& COMAR) Exclusive		
District of Columbia Reliability Statistics	SAIFI	SAIDI (Hours)
Excluding all cross-border feeders	0.35	0.67
Including all cross-border feeders	0.53	0.95

*Note- COMAR is a Maryland criteria and MSO is a DC criteria.

MSO and COMAR are not compatible with each other.

Comparison of Cross-Border Feeder Reliability Performance[46]

Pepco calculates reliability indices on a feeder level in the same way regardless of the location of a feeder. For feeders that have customers in both the District of Columbia and Maryland, the indices for these feeders are included for reporting purposes with the jurisdiction in which most customers on these feeders reside. Because feeders may switch between jurisdictions over time, to make their impact on reliability performance clear, Pepco presents system reliability performance both with and without both feeders assigned to the District of Columbia and Maryland, thereby allowing comparisons across different years.

Note: Feeders with two source substations listed are 4 kV primary network feeders and are supplied from two substations.

[46] The following is in response to the Commission's directive to:
[I]include in its 2015 Annual Consolidated Report an explanation of the metric or metrics it will use to report upon the reliability performance of its cross-jurisdictional feeders. This explanation is also to describe how Pepco's chosen metric(s) will allow reliability performance to be compared from year-to- year, when the jurisdictional status of a feeder changes between Maryland and the District
In The Matter of the Annual Consolidated Report of the Potomac Electric Power Company, Formal Case No. PEPACR-2014-01, Order No. 17816 at P 241 (February 27, 2015).

15506	Little Falls	77	-	-	443	9	100%	0%

15501- 15506 are part of the Little Falls Network Group and all are involved in serving at least one DC customer

14593 is part of the Sligo South LVAC Network group that supplies mainly Maryland Customers.

2.8 NEIGHBORHOOD ANALYSIS

Starting with Order No. 16623, the Commission has required a specific focus on neighborhoods in the Consolidated Report. This section addresses each of the neighborhood subjects required by the Commission.

In response to the Commission's requirements for reporting the neighborhoods impacted by reliability issues and remediation work, Pepco developed a comprehensive list of the feeders serving District of Columbia customers and the neighborhoods served by each in May of 2012. In order to provide neighborhood identification that is both accurate and consistent from one submission to another, Pepco is now using assessment neighborhoods as defined by the District of Columbia Office of Tax and Revenue (OTR) Real Property Tax Administration (RPTA). Pepco is assessing new methods to programmatically identify the neighborhoods each Pepco feeder serves and plans to further discuss these plans in the future.

Neighborhood Analysis Requirements

(A) Neighborhoods warranting infrastructure improvements due to increased load growth[47]

Response: See discussion for Neighborhood Item A below.

(B) Neighborhoods with decreased planned spending on 4 kV to 13 kV conversions[48]

(C) Neighborhoods with decreased planned spending on 4 kV to 13 kV conversions that are among previously identified Most Susceptible Neighborhoods[49]

(D) Explanation of how reduced conversion spending will improve reliability in Most Susceptible Neighborhoods[50]

Response: See discussion for Neighborhood Items B, C, and D below.

(E) Neighborhoods served by Priority Feeders

Response: See Priority Feeder discussion.[51]

---

[47] Order No. 16623 states the following at paragraph 35:
35. We find Pepco's explanation to be credible but require further information on the neighborhoods in the District impacted by Pepco's changed plans. Specifically, we direct Pepco to identify those neighborhoods which warrant further infrastructure improvements due to increased load growth, including any explanation and data on Pepco's forecasts of load growth in those neighborhoods. (Footnote: In identifying neighborhoods, Pepco should use the methodology it used for defining and selecting neighborhoods in its May 20, 2011 submission to the Commission, or provide an explanation of why that methodology was not used. See F.C. Nos. 766, 982 and 991, Response of the Potomac Electric Power Company to Order No. 16347, May 20, 2011, Attachment 2.)…

[48] Order No. 16623 states the following at paragraph 35:
…Similarly, we require Pepco to identify those neighborhoods where planned spending on 4 kV to 13 kV conversion projects has decreased…

[49] Order No. 16623 states the following at paragraph 35:
…Further, we require that Pepco indicate if any of the neighborhoods it identifies pursuant to this paragraph is among the Most Susceptible Neighborhoods identified in Order No. 14626, Appendix A. (Footnote: See F.C. Nos. 766, 982, and 991, Order No. 16426, July 7, 2011, Appendix A.)…

[50] Order No. 16623 states the following at paragraph 35:
If any of the neighborhoods identified in this paragraph is among those Most Susceptible Neighborhoods, Pepco is directed to provide a full explanation of how its changed plans will improve reliability in that neighborhood.

[51] Order No. 16623 states the following at paragraph 46:
46. In connection with the second prong of our reliability efforts, our neighborhood initiative, we believe it is important to know whether any of the Priority Feeders are the feeders which serve the Most Susceptible Neighborhoods in the District. Beginning in the 2012 Consolidated Report, we require that Pepco identify the neighborhoods served by any Priority Feeders…

(F) Neighborhoods served by Repeat Priority Feeders[52]

Response: See Repeat Priority Feeder discussion.

(G) Neighborhoods served by equipment subject to failure data rate analysis[53]

Response: See Failure Data Rate Analysis discussion.

(H) Updated list of Most Susceptible Neighborhoods for Calendar Year 2011[54]

Response: See Neighborhood Item H, Most Susceptible Neighborhoods update below.

(I) Neighborhood information to be included in 2012 Consolidated Report[55]

Response: This information was included in the 2012 Consolidated Report as specified above.

(J) Directive to identify neighborhoods affected by changed plans[56]

Response: See discussion for Neighborhood Items A, B, C, and D below.

(K) Directive to provide information on neighborhoods[57]

Response: See discussion for Neighborhood Items E, F, G, H, and I.

Neighborhood Item A.

Neighborhoods with Increased Load Growth

Pepco forecasts load by substation using identified PNB load along with the load reducing effects of net energy metering and conservation programs (and DERs generally) to develop short term forecasts and uses trends plus knowledge of future planned development to develop a long-term forecast for each substation in the Pepco system.

---

[52] Order No. 16623 states the following at paragraph 46:
…and any Repeat Priority Feeder (those in the ACAP program). (Footnote: In identifying neighborhoods, Pepco should use the methodology it used for defining and selecting neighborhoods in its May 20, 2011 submission to the Commission, or provide an explanation of why that methodology was not used. See F.C. Nos. 766, 982 and 991, Response of the Potomac Electric Power Company to Order No. 16347, May 20, 2011, Attachment 2.)...

[53] Order No. 16623 states the following at paragraph 46:
…Further, we require that Pepco identify the neighborhoods served by any equipment subject to the failure data rate analysis proposed by Pepco at the October 18, 2011 PIWG meeting for inclusion in the 2012 Consolidated Report. (Footnote: See October 18, 2011 PIWG Meeting Minutes at 1.)…

[54] Order No. 16623 states the following at paragraph 46:
We also require Pepco to update its list of Most Susceptible Neighborhoods to identify the neighborhood in each Ward experiencing the most frequent non-major outages in Calendar Year 2011.

[55] Order No. 16623 states the following at paragraph 46:
…This information should be included in the 2012 Consolidated Report

[56] Order No. 16623 states the following at paragraph 55:
55. Pepco is DIRECTED to identify neighborhoods affected by changed plans consistent with paragraph 35;

[57] Order No. 16623 states the following at paragraph 60:
60. Pepco is DIRECTED to provide information on neighborhoods consistent with paragraph 46;

There are areas where Pepco anticipates above average load growth, and these include the Mt. Vernon Square/Convention Center neighborhood (R.L.A.[58] (N.E.) assessment neighborhood), NoMa (R.L.A. (N.E.) assessment neighborhood), the Washington Navy Yard/Southwest (R.L.A. (S.W.) assessment neighborhood) neighborhood and the area around St. Elizabeth's Hospital and Columbia Heights.

Neighborhood Items B, C, D.

Neighborhoods with Decreased Planned Spending on 4 kV to 13 kV Conversions

Pepco does not currently estimate a material decrease in planned spending in 2021 compared to 2020 as conversions continue in the 12th Street SW, Georgetown, and North Capitol areas. Conversions will continue in North Capitol and 12th St. substations areas in 2021with the goal to have all load served by Spring of 2021 and Fall of 2021, respectively. Pepco is planning to complete the Anacostia 4 kV conversion project in 2021 with the conversion of the last remaining 4kV Feeder supplied from Anacostia Sub. 8.

Neighborhood Item F.[59]

Table 26 lists the feeders that have appeared more than once on the 2% Priority Feeder list, the years they appeared, and the neighborhoods they serve.

[58] Redevelopment Land Agency.
[59] In Order No. 15941 issued on August 18, 2010, the Commission stated at paragraphs 13 and 16, the following:

Table 26*: F*eeders that have appeared more than once on the 2% Priority Feeder *List*

Feeder	Years Appeared on Priority Feeder List Since 2001	Neighborhoods
27	2003, 2007, 2009	Shaw
53	2009, 2014	Columbia Heights, Park View

Neighborhood Item H.

Most Susceptible Neighborhoods by Ward with Most Frequent Non-Major Outages in 2021

Most Susceptible Neighborhood Analysis

Pepco was directed to provide analysis regarding the neighborhoods that were most susceptible to outages as determined by outage data. Pepco's original approach as previously filed was based upon identifying where there was a SAIFI / SAIDI impact on a Ward basis based upon the feeders that served specific neighborhoods in that Ward. Pepco has now taken a more defined geospatial approach of determining the most susceptible neighborhoods based on customer's experiencing multiple interruptions (CEMI) within that individual neighborhood. Neighborhoods in which greater than 250 customers experienced 3 or more outages in a single year within the last two years were selected. The outage analysis is inclusive of major service outages (MSOs) in order to capture the true experience of the customer. See Table 27 for the analysis of the most susceptible neighborhoods.

Table 27: Most Susceptible Neighborhoods

Neighborhood	Ward	CEMI3+ 2020	CEMI3+ 2021	Priority Feeders 2021	Priority Feeders 2022
River Terrace	Ward 7	3	1023	15709	15710
Benning	Ward 7	2	818	15709	15710
Kingman Park	Ward 6	134	811	14712	14713
Pleasant Hill	Ward 5	51	661	15013

Table 28 CEMIn Including Storms (MSO)

YEAR	CEMI3
2012	25.73%
2013	10.93%
2014	7.15%
2015	6.75%
2016	8.73%
2017	5.11%
2018	7.31%
2019	3.82%
2020	2.12%
2021	2.91%

From the analysis above, the 17 worst neighborhoods between 2020 and 2021 combined yielded 9 unique feeders to be remediated in 2022. Most of the feeders have been selected as part of a recent reliability program that also represents each neighborhood in this list. Additionally, the neighborhood list presented in this analysis represents 66% of the total DC customers that experienced three or more outages in 2021. See summary below:

- Feeders 15709, 14712, 15013, 14758, 15166, 14022, 14023, 14150, 14766, and 14150, were part of the 2021 Priority Feeder Program. The benefits on this work and other coincident work will be realized in 2022 and beyond.
- All remaining priority feeders are part of the 2022 Priority Feeder Program. The remediation work on these feeders is described above.

2.9 EQUIPMENT FAILURE RATES[60]

Pepco continues improvements to the quality of outage data. Outage data records are screened at multiple check points for accuracy. Control Center personnel review outage data daily for accuracy and make necessary edits to reflect actual circumstances. Asset Management staff performs several validation screens monthly to catch other data entry errors. Reliability Engineering staff daily review outage data and field crew comments as part of outage reviews, reliability improvement programs and when questionable data is encountered and works with Control Center staff to resolve remaining issues.

Analysis of Top Three Equipment Failure Modes[61]

This information identifies and analyzes the top three equipment failure modes in the District of Columbia with regards to total customers affected. In addition, it identifies feeders for corrective actions to remediate these failures in the future based on root cause determination where appropriate.

[60] Order No. 16975 states the following at paragraphs 95 and 118:
85. Decision: In its Comments, OPC identifies several instances in which outage data is inconsistent or erroneous. Pepco itself has identified several areas in which it can improve outage data quality. In an effort to ensure that the Commission and OPC is receiving accurate outage data, the Commission requires Pepco to report in its 2013 Consolidated Report on its efforts to improve the collection and accuracy of information regarding outages.
114.Pepco is DIRECTED to report on outage data quality improvement consistent with paragraph [95] herein.

[61] In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:
59. …(5)…If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

Analysis of Top Three Equipment Failure Modes[62]

This information identifies and analyzes the top three equipment failure modes in the District of Columbia with regards to total customers affected. In addition, it identifies feeders for corrective actions to remediate these failures in the future based on root cause determination where appropriate.

For purposes of this analysis, the following definitions are established.

- Events – number of outage events
- CI – number of customers interrupted
- CMI – Customer minutes of interruption
- SAIFI – System Average Interruption Frequency Index
- SAIDI – System Average Interruption Duration Index
- CAIDI – Customer Average Interruption Duration Index

Table 29 details the reliability impacts of primary equipment failures tracked by Pepco

[62] In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:
59. …(5)…If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

Based on the number of customer outages, as shown above in highlighted rows, the top three classes of primary equipment failures contributing to SAIFI are cable, distribution circuit breakers and switch issues, accounting for 56.2% of total customers impacted and 53.3% of total customer minutes of interruption.

Cable Failure Analysis

Based on OMS data, the District of Columbia experienced 231 primary outages caused by cable failures during the period of analysis which affected 17,287 customers. There were 5 significant events that occurred accounting for 59.6% of the cable failure customer interruptions and 24.6% of the cable failure customer minutes of interruption. The first event occurred on 5/29/2021 out of the Waterfront substation. An underground cable failure accounted for 2,853 customer interruptions across circuits 16002 and 16003; this event also caused 32,144 customer minutes interrupted. Load was restored and no further action was required regarding this event. The second event occurred on 7/6/2021 out of the Benning substation. An underground cable failure on circuit 14713 accounted for 2,603 customer interruptions; this event also caused 260,434 customer minutes interrupted. Load was restored and no further action was required regarding this event. The third event occurred on 7/16/2021 out of the Alabama Avenue substation. An underground cable failure on circuit 15173 accounted for 1,968 customer interruptions; this event also caused 38,856 customer minutes interrupted. Repairs were made and no further action was required regarding this event. The fourth event occurred on 4/6/2021 out of the Waterfront substation. An underground cable failure accounted for 1,567 customer interruptions across circuits 16002 and 16003; this event also caused 72,134 customer minutes interrupted. Load was restored and no further action was required regarding this event. The fifth event occurred on 5/12/2021 out of the Van Ness substation. An underground cable failure on circuit 14136 accounted for 1,313 customer interruptions; this event also caused 64,532 customer minutes interrupted. Load was restored and temporary repairs were made; final repairs were made the next day.

Cables are selected for remediation based on outage history and repeat outages on sections of cable or repeat outages in neighborhoods. A program is in place to install interrupters on underground primary cable. An interrupter is a similar device to the recloser in that it can isolate the fault and restore service to customers that are not on the same section of the feeder as the outage. This will reduce the number of customer interruptions caused by cable failures and assist repair crews in locating the outage.

Table 30 – Cable Failure Rates

2021 (Jan 1 - Dec 31)	Mode of Failure: Cable Failure (Primary)			
	CI	%	CMI	%
YE Total	17,287	27.99%	1,904,834	27.33%
3 Major Events*	10,304	59.61%	468,101	24.57%

* % related to the total number of primary cable failure events

Analysis of these 231 cable failure events as reported by OMS revealed that 59.6% of the customers impacted by cable failure can be attributed to three events. See summary below:

Table 31 details the primary cable failure events causing the largest customer impact.

Table 31 – Event Detail for Cable Failures

Feeder	Substation	Date	CI	CMI	Cause	UG Miles	UG%	Comment
16002/16003	Waterfront	5/29/2021	2,853	32144	UG Cable Failure	25.79	100.0%	Load restored, no further action required

16002/16003	Waterfront	4/6/2021	1,567	72,134	UG Cable Failure	25.79	100.0%	Load restored, no further action required
14136	Van Ness	5/12/2021	1,313	64,532	UG Cable Failure	6.22	76.1%	Load restored; temporary repair made. Final repairs occurred on next day
Total:			**10,304**	**468,100**				

Distribution Circuit Breaker Analysis

Based on OMS data, the District of Columbia experienced 14 distribution circuit breaker-related outages during the period of analysis which affected 9,282 customers. There were 5 significant events that attributed to 98.9% of the customers impacted and 99.2% of the customer minutes of interruption. The first event occurred on 6/3/2021 out of the Benning substation. A distribution circuit breaker failure accounted for 2,244 customer interruptions on circuit 14713; this event also caused 449,959 customer minutes interrupted. Load was restored and subsequent repairs occurred at a later date. The second event occurred on 6/3/2021 out of the Benning substation. A distribution circuit breaker failure accounted for 2,234 customer interruptions on circuit 15710; this event also caused 141,896 customer minutes interrupted. Load was restored and subsequent repairs occurred at a later date. The third event occurred on 6/3/2021 out of the Benning substation. A distribution circuit breaker failure accounted for 1,686 customer interruptions on circuit 15711; this event also caused 100,480 customer minutes interrupted. Load was restored and subsequent repairs occurred at a later date. The fourth event occurred on 6/3/2021 out of the Benning substation. A distribution circuit breaker failure accounted for 1,534 customer interruptions on circuit 14717; this event also caused 177,606 customer minutes interrupted. Load was restored and subsequent repairs occurred at a later date. The fifth event occurred on 6/3/2021 out of the Benning substation. A distribution circuit breaker failure accounted for 1,481 customer interruptions on circuit 15705; this event also caused 194,357 customer minutes interrupted. Load was restored and subsequent repairs occurred at a later date.

Table 32 – Distribution Circuit Breaker Failure Rates

2021 (Jan 1 - Dec 31)	Mode of Failure: Distr. Ckt. Breaker (Primary)			
	CI	%	CMI	%
YE Total	9,282	15.03%	1,072,912	15.39%
5 Major Events*	9,179	98.89%	1,064,298	99.20%

* % related to the total number of primary distr. ckt breaker events

Analysis of these 14 events as reported by OMS revealed that 98.9% of the customers impacted by distribution circuit breakers can be attributed to five events. See summary below:

Table 33 details the primary distribution circuit breaker events causing the largest customer impact.

Table 33 – Event Detail for Distribution Circuit Breakers

Feeder	Substation	Date	CI	CMI	Cause	UG Miles	UG%	Comment
14713	Benning	6/3/2021	2,244	449,959	Distr. Circuit Breaker Failure	6.7	99.7%	Load restored; subsequent repairs occurred at later date

14717	Benning	6/3/2021	1,534	177,606	Distr. Circuit Breaker Failure	2.08	26.0%	Load restored; subsequent repairs occurred at later date
15705	Benning	6/3/2021	1,481	194,357	Distr. Circuit Breaker Failure	3.03	40.4%	Load restored; subsequent repairs occurred at later date
Total:			**9,179**	**1,064,298**				

Switch Failure Analysis

Based on OMS data, the District of Columbia experienced 28 switch related outages during the period of analysis which affected 8,111 customers. There were 3 significant events that accounted for 89.4% of the customer interruptions and 68.5% of the customer minutes of interruption. The first event occurred on 5/23/2021 out of the Tenth Street substation. A switch failure caused 3,258 customers interrupted across feeders 15204R and 15204W and also accounted for 591,856 customer minutes interrupted. Crews made repairs accordingly and no further action was required regarding this event. The second event occurred on 9/30/2021 out of the Ft Slocum substation. A switch failure caused 2,257 customers interrupted across feeders 15004 and 15002 and also accounted for 20,012 customer minutes interrupted. Crews made repairs accordingly and no further action was required regarding this event. The third event occurred on 10/12/2021 out of the Benning substation. A switch failure caused 1,737 customers interrupted on feeder 15707 and also accounted for 18,094 customer minutes interrupted. Crews made repairs accordingly and no further action was required regarding this event.

Table 34: Switch Failure Rates

2021	Mode of Failure: Switch (Primary)			
(Jan 1 - Dec 31)	**CI**	**%**	**CMI**	**%**
YE Total	8,111	13.13%	735,474	10.55%
3 Major Events*	7,252	89.41%	504,116	68.54%

* % related to the total number of primary switch events

Analysis of these 28 events as reported by OMS revealed that 89% of the customers impacted by switch failure can be attributed to three events. See summary below:

Table 35 details the primary switch failure events causing the largest customer impact.

Table 35 Event Detail for Switch Failure Rates

Total:			**7,252**	**629,962**				

Order No. 16975 states the following at paragraphs 68 and 109:

68. Decision: *Pepco is directed to report on efforts to reduce equipment failure in the 2013 Consolidated Report and in future Consolidated Reports*.

109. Pepco is DIRECTED *to report on its efforts to reduce equipment failure consistent with paragraph 68 herein;*

2.10 OUTAGE CAUSES

Interruptions to electric service can be caused by a range of occurrences, such as downed trees or limbs on power lines; high winds and lightning; heavy rain, snow, or ice; animals on equipment or power lines; traffic accidents that damage poles and equipment; underground construction accidents; and equipment failures.

The eight main outage causes in the OMS are:

- Animal – Outage caused by contact between Birds, Squirrels, Snakes and Other small animals and the distribution system;
- Equipment Failure - Includes Equipment Failures Only;
- Equipment Hit - Includes Cable Cuts, Motor Vehicle Hits and Foreign Contact;
- Others - Includes Employee, Fire, Load Shedding, Source Lost, Vandalism, Voltage;
- Overload - Includes Overloading only;
- Tree - Includes Outside ROW- Limb, Outside ROW-Down, Inside ROW-Limb, and Inside ROW-Down;
- Unknown - Includes Unknown Only indicates that the field responder did not know the cause of the outage; and
- Weather - Includes Flood, Ice, Lightning, Wind.

The following table reflects the outage cause options from which crews select when entering data into the Mobile application at the time of restoration. Through the Mobile NMS (Network Management System) completion window, crews have the ability to enter the event restoration information through drop down menus that are represented in the following table as well as any additional information through a free form text field. The outage cause selections are later classified into the categories above for reporting purposes. The detailed outage causes are maintained to assist in analysis of not only the cause of the outage but also the corrective actions necessary to reduce future outages.

An explanation of the selection categories from the drop-down menus follows Table 36 below.

- **Non-PHI** - If the event is not caused by Pepco equipment or if it is impossible to complete the request (e.g., bad address) crews must select one item from the Non-PHI list box of the MDS restoration screen indicating the circumstances, such as other utility, customer equipment, APGE (advise party to get electrician). If a selection is made from this list, the crew can complete and close ticket without further information. If no selection is made, then the event is on Pepco equipment and additional information is needed to complete the record.
- **Weather** - Crew must select from the list the observed weather conditions at the time of the outage.
- **Class** - Crew must select one item from the drop-down list describing the construction type.
- **Device** - Crew must select the clearing device.
- **Action** - Crew selects the action taken to restore the event/outage.
- **Cause/problem** - Crew must select the cause of the event. A ticket cannot be closed without a cause selection if the event was on Pepco equipment.
- **Equipment Failure** - Crew must enter information about the failed device related to the event if equipment failure is the cause / problem selected.
- **Phase** - Selection box for the phase(s) impacted by the event/outage.
- **Manhole** - Selection box for items describing the contents of a manhole.
- **Follow-up Area -** For an event that needs additional work but does not require immediate attention, a crew may select a follow-up area. For example, in the case of a URD cable failure where all load is restored through a common tie, the event would have a follow-up selection.

The most common causes of power outages are equipment failures and vegetation. High winds, heavy rain or snow and ice can cause trees or branches to topple and tear down power lines. Tree limbs brushing or resting on the lines cause short circuits and blown fuses. As shown in Table 37, there are several different equipment types that fall under the "Equipment Failure" category. One such type is fuse-related outages. The job of the fuse is to protect equipment. If a fuse blows, it is not an equipment failure but rather the fuse is performing its designed function. As a result, there are fewer actual "Equipment Failures" than are captured by the OMS.

If a non-Pepco construction crew digs a foot or two in the wrong direction, damage to an underground power line could cause an instant disruption of electric service or could cause damage that may not result in a power outage until days, weeks or months later.

Vehicles that damage utility poles or equipment can also cause power outages. Small animals, like squirrels, sometimes chew into lines or come into contact with a piece of equipment and an energized line, causing a fault and subsequent interruption of electric service.

An event classified as "Unknown" indicates that the field responder did not know the cause of the outage and this classification is used most frequently where a service interruption results from the operation of a protective device such as a fuse or recloser. These devices protect the electric distribution system from damage by sensing fault current on a particular circuit and activating a break in the flow of current. Typically, if there is no discernable damage to the circuit and the cause of the fault is not evident in the vicinity of the protective device that was activated, the device will be replaced or reset, and the circuit re-energized. If the device holds (no fault current is detected), the field responder may report "Equipment Failure" or "Unknown" as a cause and move on to the next trouble call assigned. The operation of these protective devices are not equipment failures because the fuse or recloser is operating correctly when it opens to isolate a fault further down the line. Occasionally, the field responder may find a probable cause some distance from the protective device involved (such as a tree branch on the ground underneath the overhead lines), but, for the most part, crews are focused on restoration of service rather than full investigation of the cause of any interruption (where this is not immediately evident).

Table 37 contains District of Columbia outage cause data for calendar year 2021.

2.11 VM BUDGET, TREE-RELATED OUTAGES[63][64]

Table 38 shows District of Columbia distribution tree trimming expenses (not including poles, substation mowing, or storm-related tree trimming) and budgets. Provided are actual and budgeted amounts for 2013-2021.

Pepco's VM program includes increased trimming above all three-phase and single-phase lines. For three-phase lines it also includes the removal (with permission) of any limbs identified by Pepco Arborist planners that have a probability of breaking and falling into the conductors.

---

[63] In Order No. 16623 at paragraphs 37 and 56, the Commission ordered the following:
37. Decision: …We require Pepco to explain why it has decreased its budget for tree trimming over the last seven years, if tree trimming is the most important factor impacting customers suffering from power outages. Pepco should include that explanation in the 2012 Consolidated Report.
56. Pepco is DIRECTED to provide an explanation of its budget for tree trimming consistent with paragraph 37.
[64] Order No. 16975 states the following at paragraphs 43 and 99:
43. Decision: The Commission finds Pepco's explanation of its budget variance for the single year 2011 insufficient to explain budget variances that totaled 26.9% below budget for five of the last six years. Therefore, the Commission requires Pepco to explain the budget variances that have occurred from 2006-2011 in its 2013 Consolidated Report. Additionally, we agree with Staff Recommendation #3 and require Pepco to include an explanation of any budget variance in its vegetation management expenditures and its EIVM expenditures in future years' Consolidated Reports. We are extremely concerned about the explanation provided in the Consolidated Report for why vegetation management expenditures were below budget in five of the last six years. Pepco stated that "while actual expenditures were below budget, work was completed consistent with planning." This is an inadequate explanation for a repeated failure to spend budgeted amounts on tree-trimming – arguably, the "most important factor impacting customers suffering from power outages." We therefore require Pepco to expand upon its explanation. If Pepco means that, through efficiencies, all the work intended to be accomplished in the budget was actually accomplished for less, then we direct Pepco to document what was intended to be included in the budget and what efficiencies were achieved so that the budgeted work was accomplished at a lower cost. The Commission also requires Pepco to explain what impact these efficiencies had on the budget process in subsequent years. If Pepco's statement about planning has some other meaning, we direct Pepco to provide it and to show what "planning" was involved, by whom and when. We also expect a precise and detailed explanation of why such planning would result in expenditures consistently, and significantly, below the budgeted amounts for a number of years. Further, we agree with OPC's suggestion that Pepco explain why its program does not include increased trimming above the three phase tap line or the single tap lines. Pepco is directed to provide this information in the 2013 Consolidated Report.
99. Pepco is DIRECTED to provide an explanation of budget variances for its own vegetation management work as directed in paragraph 43 herein;

Yearly Data on Tree Trimming & Tree-Related Outages

In accordance with Order No. 15621,[65] presented in the following tables, is Pepco's "yearly data on vegetation management by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports." The tables list the outages coded as tree-related in 2021, also sorted by feeder, allowing for a comparison between the two sets of tables. It is possible that additional outages may have been caused by trees but with causes coded as weather or unknown if fallen trees or limbs were not found at the site.

[65] In Order No. 15621 at paragraph 5, the Commission ordered the following:
5. Pepco shall file within the Company's annual Consolidated Reports to the Commission, yearly data on tree trimming by feeder and wards (or multiple wards) compared to the Company's tree down and tree limb outage causes listed in its monthly power outage reports beginning with the Company's 2010 Consolidated Report.

Pepco tracks the District of Columbia System Tree SAIFI and SAIDI to measure the effectiveness of VM. Tree SAIFI and SAIDI measures the level of vegetation-caused outages. The following tables present data showing the System Tree SAIFI and SAIDI (in minutes) for the Pepco District of Columbia service territory for 2017 to 2021, based on the Major Service Outage ("MSO") exclusion criteria.

Table 41

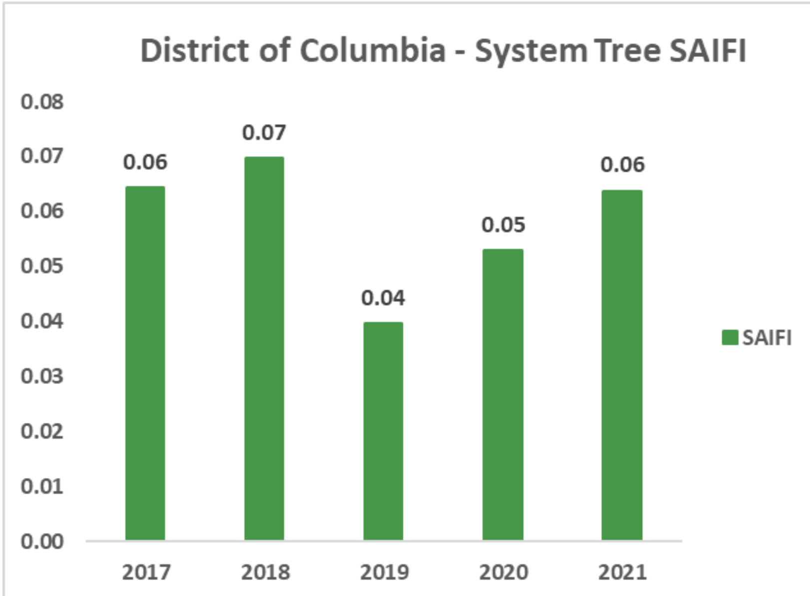

Table 42

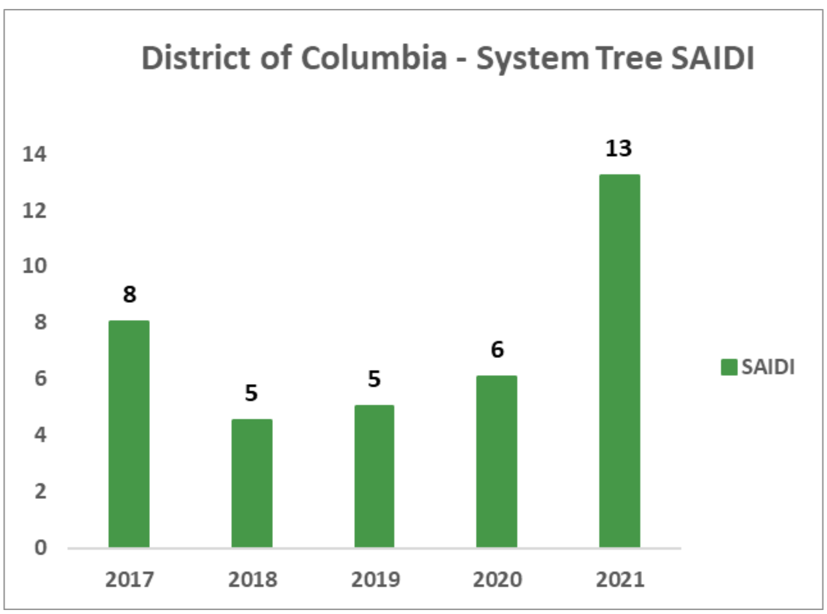

2.12 ELECTRICITY QUALITY OF SERVICE STANDARDS (EQSS)

The Commission introduced the EQSS to establish standards and requirements for ensuring that electric utilities operating in the District of Columbia meet an adequate level of quality and reliability in the electric service provided to District residents. On February 29, 2008, the Commission issued a Notice of Final Rulemaking (NOFR) on the EQSS. The EQSS are now adopted as Chapter 36, Electricity Quality of Service Standards in Title 15 of the District of Columbia Municipal Regulations. Subsequently on July 25, 2008, the Commission issued a NOFR on Compliance Reporting. Pepco and all electricity suppliers within the District of Columbia were directed to collect EQSS data on a monthly basis and retain the reporting data for seven (7) years. Further, quarterly submissions, containing monthly data, are to be filed with the Commission on April 30, July 30, October 30 and January 30 for the prior three (3) months respectively. Specific Consolidated Report requirements from the EQSS portion of the

D.C.M.R. are listed on the footnote.[66]

---

[66] Progress on current corrective action plans [on customer calls answered] shall be included in the utility's annual Consolidated Report.

The utility shall report the actual call center performance during the reporting period in the annual Consolidated Report of the following year.

Progress on any current corrective action plans [on call abandonment rates] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.

Progress on any current corrective action plans [on new residential service installation requests] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3603.5 The utility shall report on the progress of the corrective action plan [on repeat least performing feeders] in the Annual Consolidated Report submitted to the Commission.

The utility shall report on the number and percentage of non-major service outages that extend beyond the twenty-four (24) hour standard and the reasons each such outage extended beyond the twenty-four (24) hour standard.

The report drafted pursuant to Section 3603.8 shall be included in the annual Consolidated Report on reliability data.

Electricity Quality of Service Standards Results

January – December 2021 Aggregate Totals

The utility shall report on the progress of the corrective action plan [on SAIFI, SAIDI and CAIDI benchmarks] in the annual Consolidated Report submitted to the Commission.

The utility shall also, per the orders of the Commission, continue current requirements of reporting annual reliability indices of SAIFI, SAIDI and CAIDI (with and without major events) in the annual Consolidated Report of the following year.

Commission shall determine whether further investigation is necessary.	Report must contain **(a) - (f)**.	2	100%			

Non-Major Outages, Restoration Completion Within 24 Hours

In accordance with Section 3603.8 in the EQSS, Pepco is to include in the Consolidated Report the number and percentage of non-major customer outages that extend beyond the 24-hour standard and the causes for these extended service outages. A Major Service Outage in the District of Columbia, as defined in Section 3699.1, Definitions, of the EQSS states, *"customer interruption occurrences and durations during time periods when 10,000 or more of the electric utility's District of Columbia customers are without service and the restoration effort due to this major service outage takes more than 24 hours."*

Table 43 provide the required information.

For 2021, there were 2 (of 270) non-major outages that extended beyond 24 hours.

Table 43: Percentage of Non-Major Outages that Extended Beyond 24 Hours

Total number of Non-Major Outages extending beyond 24 hours	2
Total number of Non-Major Outages: January 1 - December 31, 2021	270
Percentage of Non-Major Outages extending beyond 24 hours	0.74%

PART 3: 2020 MANHOLE EVENT REPORT

Section 3 2021 MANHOLE EVENT REPORT[67]

Part 3 of the Consolidated Report includes manhole event information, underground failure analysis results, detailed tracking trends in reportable events based on manhole cover type, and Pepco's cable splice records for 2021. The appendices provide detail regarding manhole events, and Pepco's manhole inspection program.

[67] In Order No. 16091 issued on December 10, 2010, the Commission stated at paragraphs 56, 59, 65, and 66 the following:
56. Decision. Pepco has agreed to make the recommended changes in the 2011 Consolidated Report with the exception of data on failure rates. We require that the members of the PIWG discuss the need for and feasibility of providing data on failure rates in future Consolidated Reports and include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.
59. Decision. We adopt the Staff's recommendation and require Pepco to: (1) combine the Manhole Events portion of the failure analysis report with Part 3 of the Consolidated Report; (2) include data in the 2011 Consolidated Report that separates 4 kV primary failures from 13 kV primary failures;
(3) include data in the 2011 Consolidated Report that separates 4 kV from 13 kV manhole events; (4) include trend analyses for "Use of Slotted Manhole Covers;" and (5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable. If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.
65. Pepco IS DIRECTED to include a discussion of failure data rates in the agenda for the Productivity Improvement Working Group, consistent with Paragraphs 56 and 59 of this Order; and
66. Pepco IS DIRECTED to include additional Manhole Event data in the 2011 Consolidated Report, consistent with Paragraph 59 of this Order.

In Order No. 15152 paragraphs 76 and 66, the Commission ordered the following:
76. PEPCO is DIRECTED to include as part of the 2009 Consolidated Report a proposed plan for significantly reducing manhole events consistent with paragraph 66 of this Order…

3.1 2021 MANHOLE EVENT INTRODUCTION

Pepco herein submits its annual Manhole Event Report for 2021 in accordance with Order Nos. 11716, 13812, 15620 and 16091.

Summary of 2021 Manhole Events

During 2021, there were a total of 25 reportable manhole events in the District of Columbia. Of these 25 manhole events, 16 were classified as Smoking Manholes (S), 8 were classified as Manhole Explosions (E), and 1 were classified as Manhole Fires (F). All 25 events occurred on the 13 kV system. There were 0 events that occurred on the 4 kV system and 0 events occurred on the 69kV system. Appendix 3A is a list of the 2021 manhole events, categorized and described as directed in Order Nos. 11716, 13812, 15620 and 16091.

3.2 UNDERGROUND FAILURE ANALYSIS

Order No. 17074 Requirement

38. *The Order further noted OPC's statement that according to Pepco, its replacement program would screen all feeders by collecting the number of underground faults experienced by each feeder in the last ten years and feeders with five or more faults ("5-in1-10") would be further analyzed for replacement. [Footnote: See F.C. 766-ACR-12, Order No. 16975, paragraph 75.] ...Thus, we direct Pepco to report on the results of its screening program along with Pepco's recommendations for further analysis and replacement in the ACR starting with 2013.*

40. *... Some progress should have been made in the development of a tracking mechanism for PILC actual replacement and Pepco should be able to report on the actualization of its strategy with data that will help the Commission to better understand Pepco's future plans for PILC replacement and examine the results of its PILC Replacement Strategy. Thus, the Company is required to report on the actualization of its PILC Replacement Strategy in the ACR and to include in the report the information identified in Recommendations 8(c), (d) and (e). If the requested information is not available, Pepco shall provide a reasonable substitute that will allow the Commission to assess the progress that Pepco has made and intends to make in the implementation of its PILC Replacement Strategy for the ten-year period from 2012 to 2021.*

Pepco Response – Corrective Actions

Pepco is currently in the process of analyzing available data of the underground electric system faults in the District of Columbia. Feeders with at least five faults within ten years were identified for further analysis. From that list of feeders, those that are already being addressed as part of Pepco's Reliability program and/or other strategies—or programs that would address these issues on the feeders—were removed to avoid duplication of efforts.

In 2021 targeted PILC replacement was performed on eight feeders, shown below in Table 45.

Table 45: PILC Replacement Status

Year	Feeder ID	PILC Replaced & In Service(ft)
2021	14531	5932
2021	14535	7268
2021	14536	4022
2021	14537	1965
2021	14538	8025
2021	14539	2420
2021	16002	6778
2021	16003	7901

In Pepco's 2001 "Alternative Design Proposal to Pepco's 15kV Paper Insulated Lead Covered Power Cables (PILC)" study, Pepco estimated there were 1,109 miles of primary lead cables on the Pepco system in the District of Columbia. Given the current configuration of the District of Columbia underground system, which includes varied duct and manhole sizes, it is not possible to know how many of those miles are non-replaceable. Reconfiguring the manholes and ducts would allow most of Pepco's PILC cable to be replaceable, albeit at significant cost and time. As stated in Pepco's PILC Replacement Strategy, in line with most other electric utilities and with industry best practice, Pepco has not committed to replacing a fixed number of miles of PILC each year and has not identified a year by which full replacement of primary PILC would be expected. Instead, Pepco is seeking opportunistic replacement based on conditions, which it expects to be a more cost-effective replacement strategy.

Consequently, Pepco cannot provide an estimate of the number of miles of PILC that will be replaced by EPR for the 10-year period from 2012 through 2021. Since 2001, Pepco has replaced 9 2 miles of PILC in the District of Columbia both through the opportunistic replacement approach, and planned jobs. This data is reflected in the Table below.

Table 46: PILC Replacement: 2001-Present

Years	***PILC Replaced Footage***	***PILC Replaced Mileage***
2001	0	0
2002	0	0

Underground (UG) Failure Analysis

The results of Pepco's annual UG failure analyses are presented below, in compliance with Order No. 12735 paragraph 138.[68]

In analyzing the performance of the Pepco UG system, it is necessary to distinguish three different measures of system performance:

- Equipment Failures
- Outages
- Reportable Events (RE)

An RE is a reported explosion, fire, or smoke in a manhole. Some Pepco equipment failures may result in customer outages, REs or both. However, not all Pepco equipment failures result in an outage and/or an RE. This is due to the redundancy of some components of the system, especially on secondary networks. In fact, for the underground secondary networks, most equipment failures do not result in customer outages because each network is fed by multiple primary feeders, and each customer can be fed from multiple transformers and secondary mains, making them less susceptible to outages. Further, some underground outages or events are not initiated by equipment failures, but are in fact caused by accidents, such as dig-ins by excavation contractors, failures of non-Pepco equipment, such as District of Columbia owned streetlight cables or gas company equipment.

There are three types of manhole reportable events:

- Explosions
- Fires
- Smoking

Of these three types, from 2017– 2021 smoking manhole events account for the majority of all manhole events experienced in the District. See Figure 9.

[68] In Order No. 12735, paragraph 138, the Commission ordered the following:
138.Pepco shall file a report that summarizes the results of the failure analyses conducted for the calendar year 2002, 30 days from the issuance date of this Report and Order, and subsequently, to file an annual report on the results of the failure analysis group to the PIWG;

Figure 9: Manhole Events - Smoking (2017-2021)

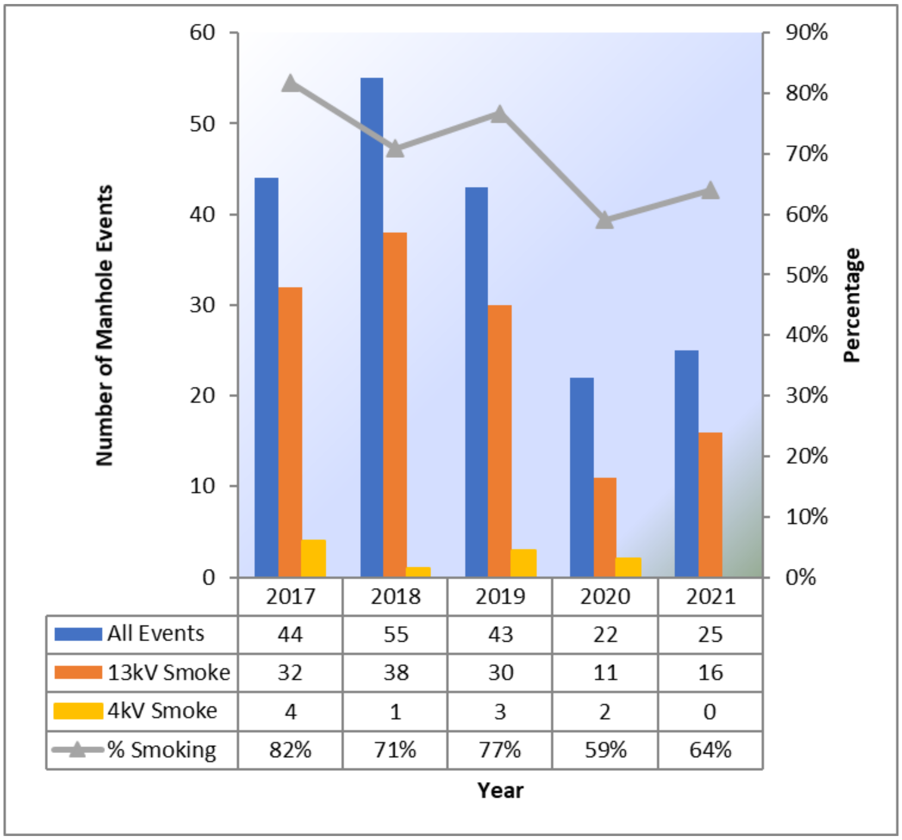

Figure 10 breaks down the number of manhole fires and manhole explosions as compared to the total number of events. As reflected below, explosions and fires occur less frequently than smoking manholes.

Figure 10: Manhole Events - Explosions (2017-2021)

	2017	2018	2019	2020	2021
All Events	44	55	43	22	25
13kV Explosions	2	9	2	5	8
4kV Explosions	0	1	0	0	0
% Explosions	5%	18%	5%	23%	32%

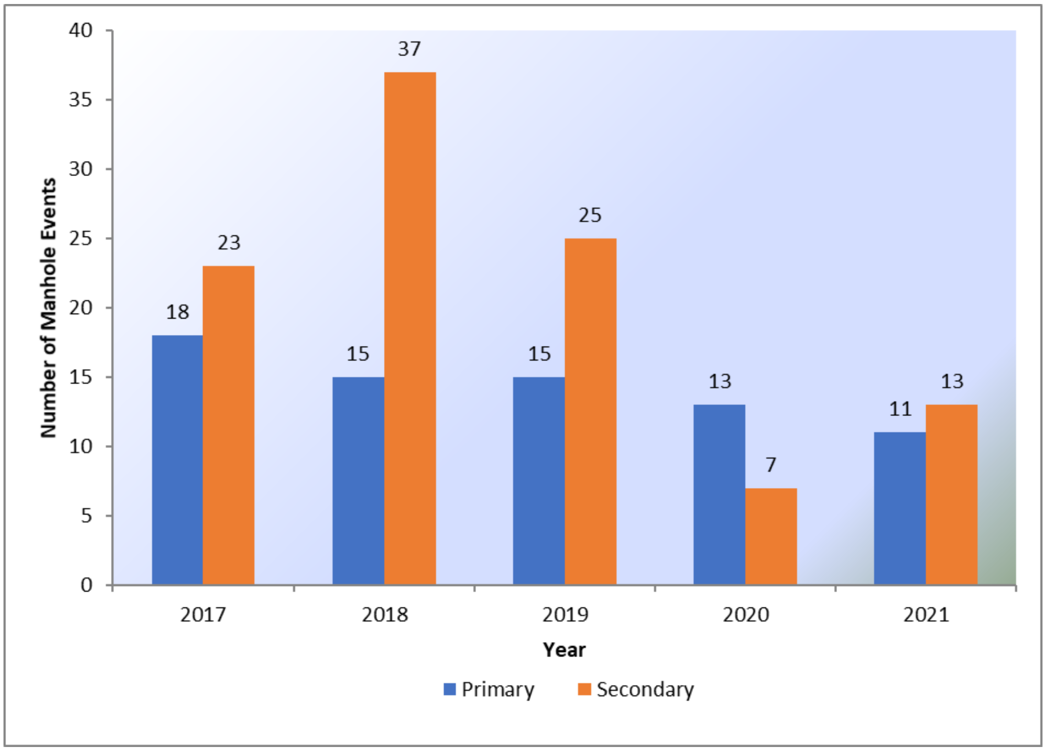
Figure 11: Manhole Events - Fires (2017-2021)

	2017	2018	2019	2020	2021
All Events	44	55	43	22	25
13kV Fires	5	5	8	4	1
4kV Fires	1	0	0	0	0
% Fires	14%	9%	19%	18%	4%

Year

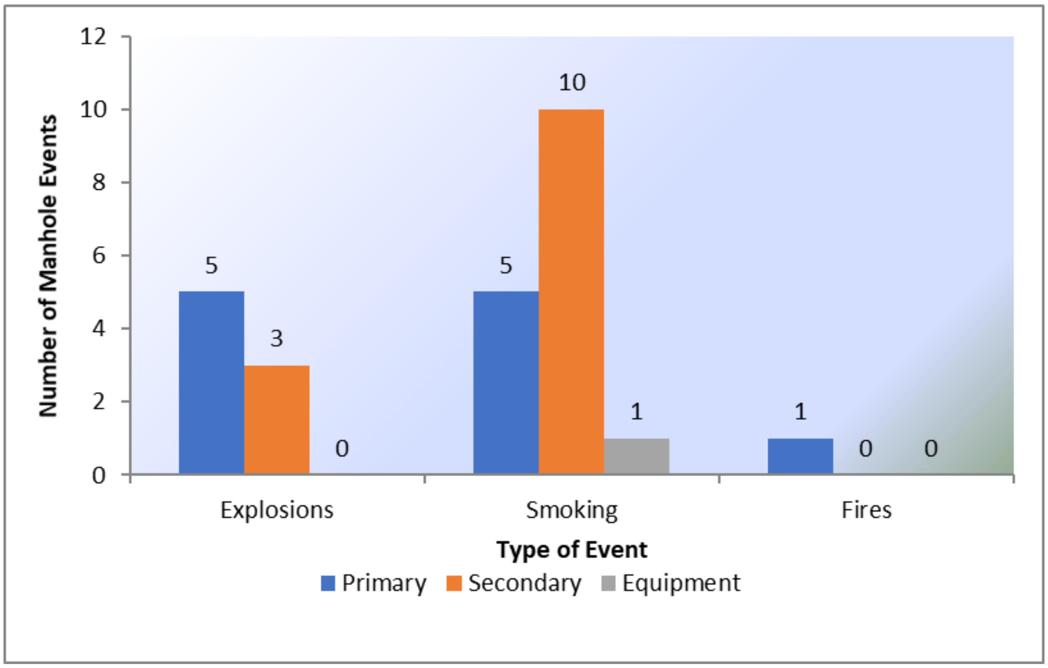
Since 2017, on average most of the manhole events experienced in the District have occurred on Pepco's secondary equipment. See Figure 12.

Figure 12: Manhole Events by Type of Equipment (2017-2021)



In 2021, 0 manhole fires occurred on the secondary systems. Smoking manholes occurred more on the secondary system, and manhole explosions occurred more on the primary system. Figure 3.5 depicts this breakdown. See Figure 13.

Figure 13: Manhole Events by Type and Equipment (2021)



Slotted manhole covers are designed to minimize the frequency and impact of manhole events by allowing gas and smoke to vent from manholes in the event of an underground failure. This provides an early warning and prevents build-up of gases to potentially explosive proportions; thereby allowing energy to disperse more easily should an event occur. The tradeoff when installing slotted covers is that they allow more water and street run-off contaminants to enter the manhole than solid covers. More analysis on the effects of slotted covers and manhole events is presented in the slotted manhole cover section of this report. See Figure 13 and Figure 14 for a breakdown of manhole event by event type, voltage class, and cover type.

Figure 14: Manhole Events by Type, Equipment, and Manhole Cover (2017-2021)

	2017	2018	2019	2020	2021
Solid Primary	17	12	14	13	9
Solid Secondary	11	20	18	5	10
Slotted Primary	3	3	3	0	1
Slotted Secondary	12	17	6	2	3
Grated Primary	1	3	1	2	2
Grated Secondary	0	0	1	0	0

Figure 15: Slotted Manhole Events by Type (2017-2021)

	2017	2018	2019	2020	2021
Slotted Smoking	14	18	7	1	4
Slotted Fire	1	2	1	1	0
Slotted Explosions	0	0	1	0	0

By design, primary cable is more insulated than secondary cable. Whereas primary cable and its accessories are designed to their voltage rating and are shielded, secondary cable and its accessories are not shielded. As a result of less physical protection, secondary cable and its accessories are more likely to fail due to a breach in the insulation. Since 2017, the leading cause of manhole reportable events in the District is insulation-related, such as insulation deterioration. See Figures 16 through 20.

Figure 16: Selected Failure Causes (2017)

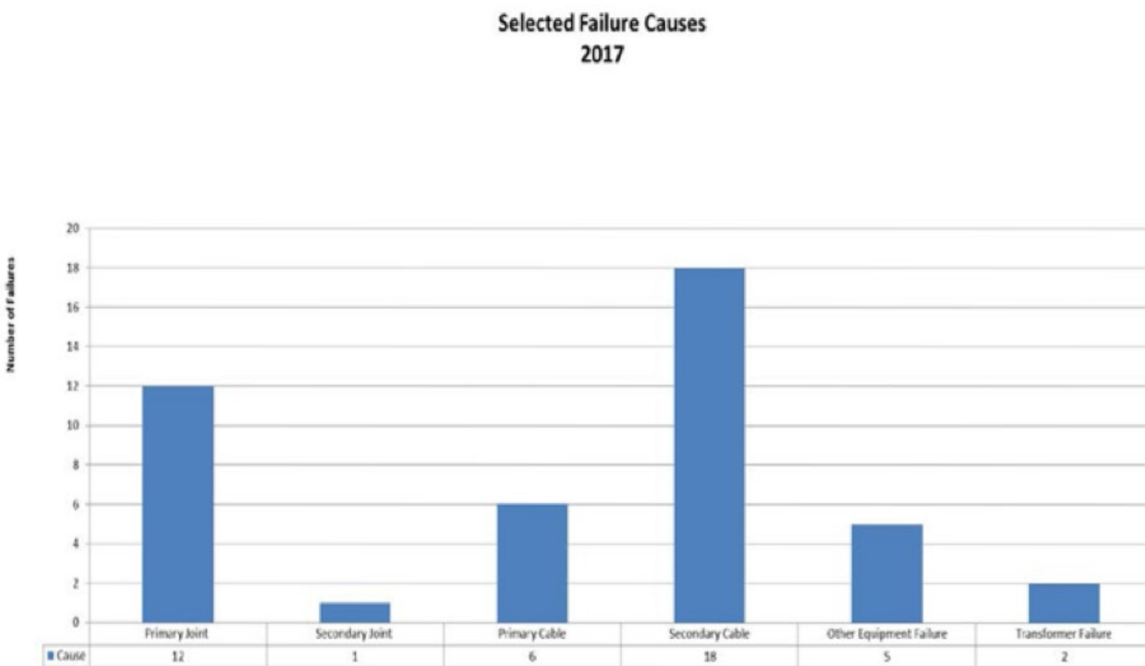


Figure 17: Selected Failure Causes (2018)

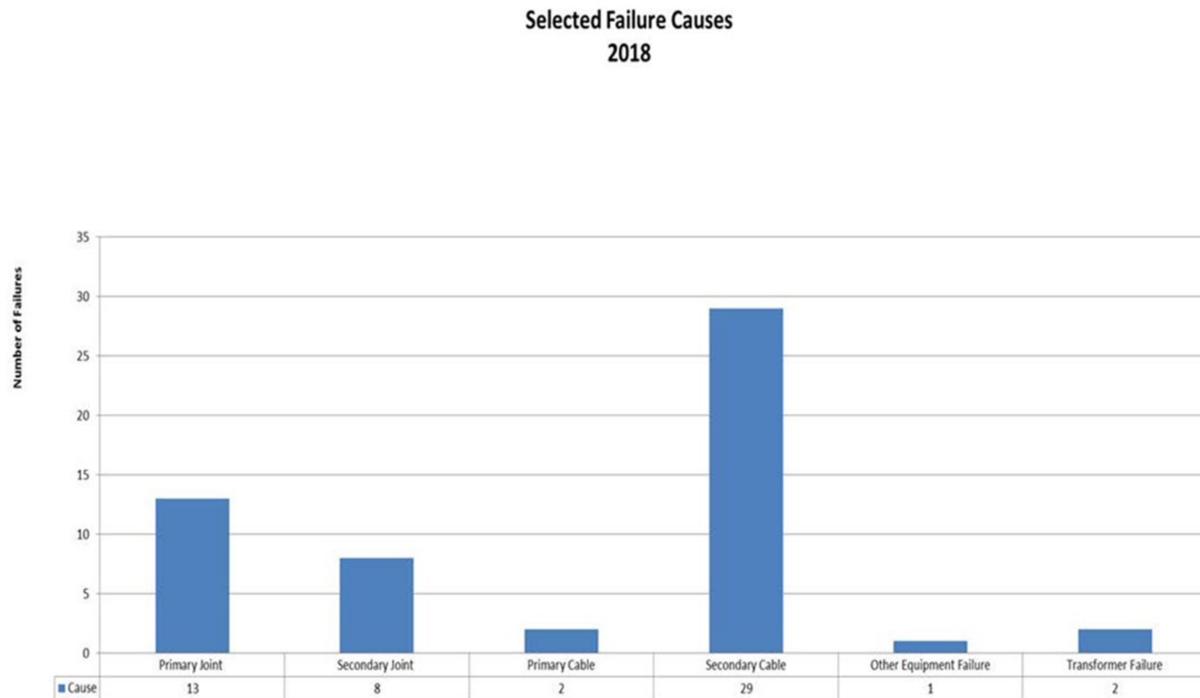

Figure 18 Selected Failure Causes (2019)

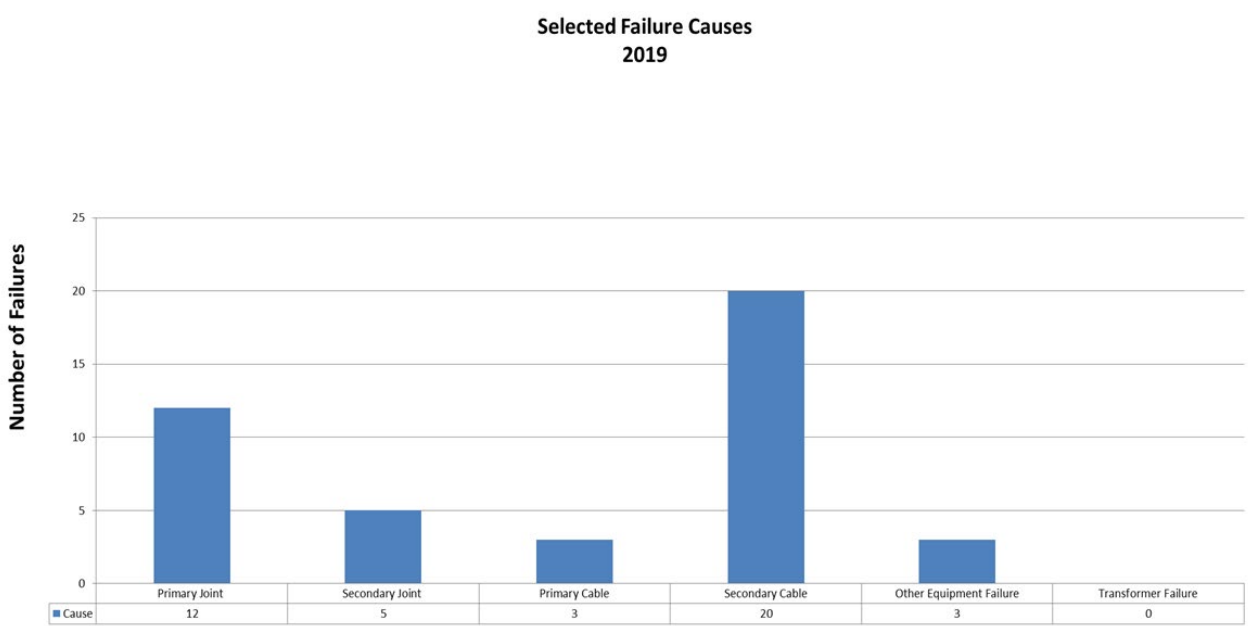

Figure 19 Selected Failure Causes (2020)

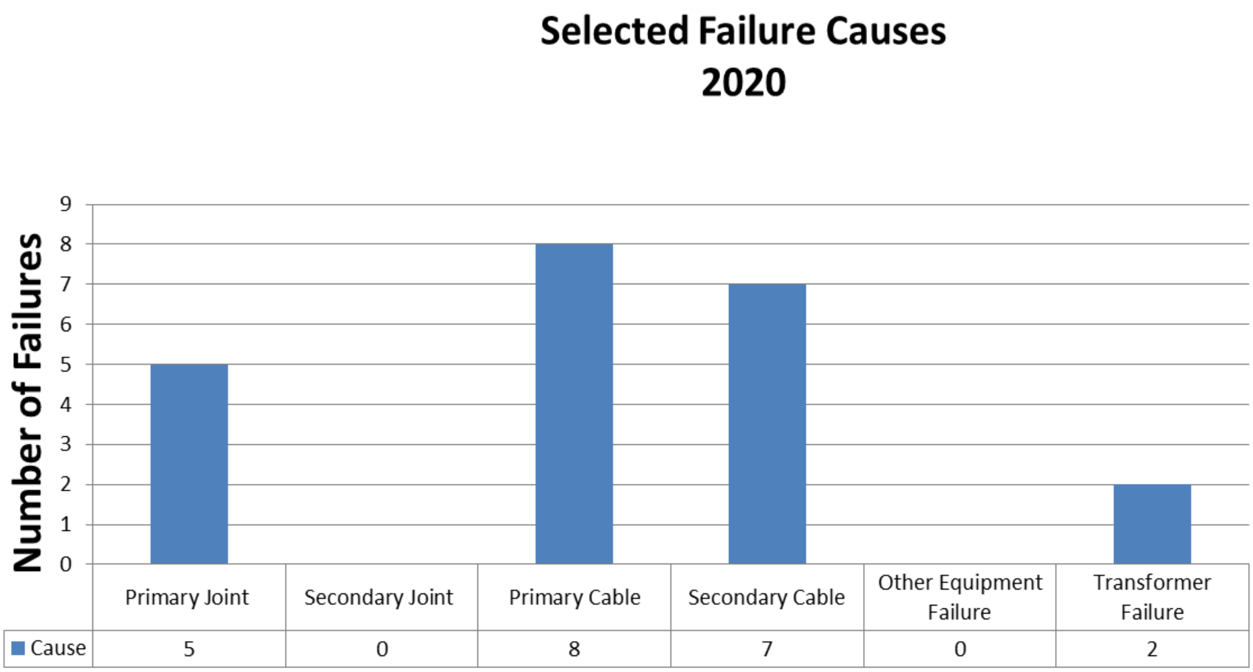

Figure 20 Selected Failure Causes (2021)

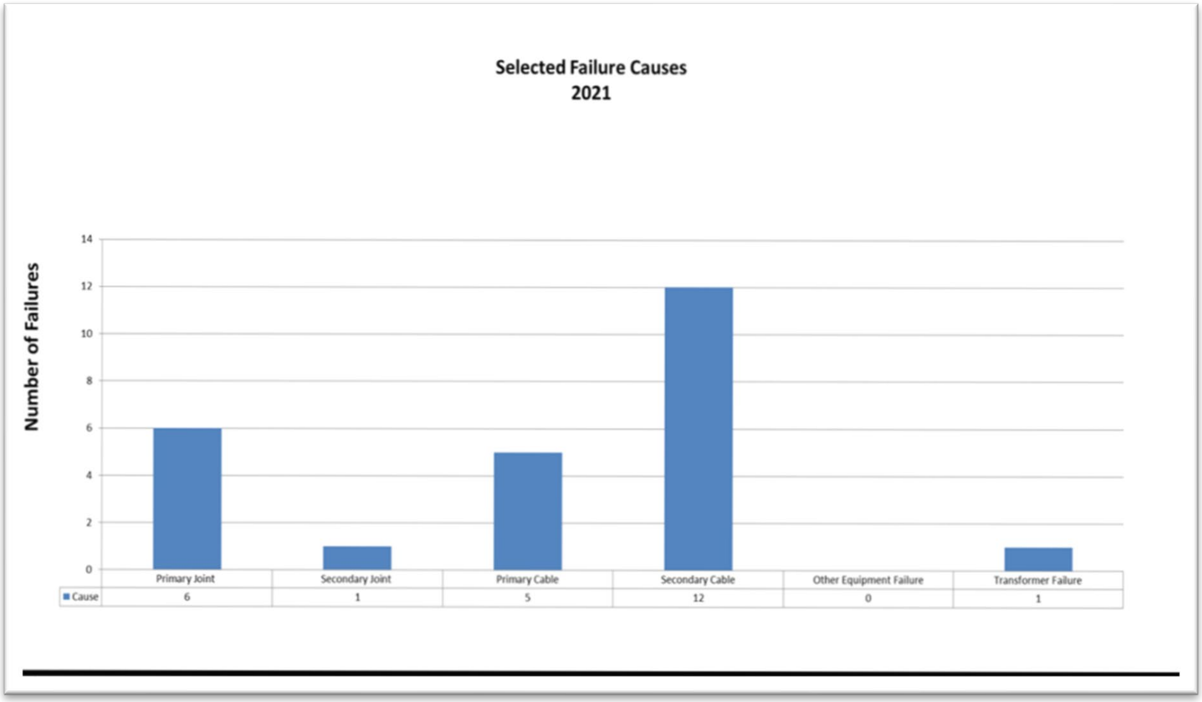


3.3 Selected Failure Causes (2021)

The type of insulation related to cable and joint failures resulting in a reportable event for secondary equipment does not provide a discernible trend in reportable events caused by Rubber Lead (RL), Rubber Neoprene (RN), or other insulation types (Figure 21). RL secondary cable is an outdated technology and has not been installed on the system for more than twenty years. It is not possible to trend future reportable events associated with this cable type.

Figure 21: Insulation Type of Secondary REs (2012-2021)

	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
PILC	17	13	22	6	29	15	8	11	8	9
RL	0	2	2	1	1	3	0	0	2	0
RN	0	0	0	1	1	1	1	0	1	1
EPR	3	5	3	5	1	0	7	4	2	0
Other	2	1	0	3	3	0	0	0	0	1

PILC is the predominant primary cable on the Pepco underground system. Consequently, most primary cable reportable events involve PILC cable (Figure 22).

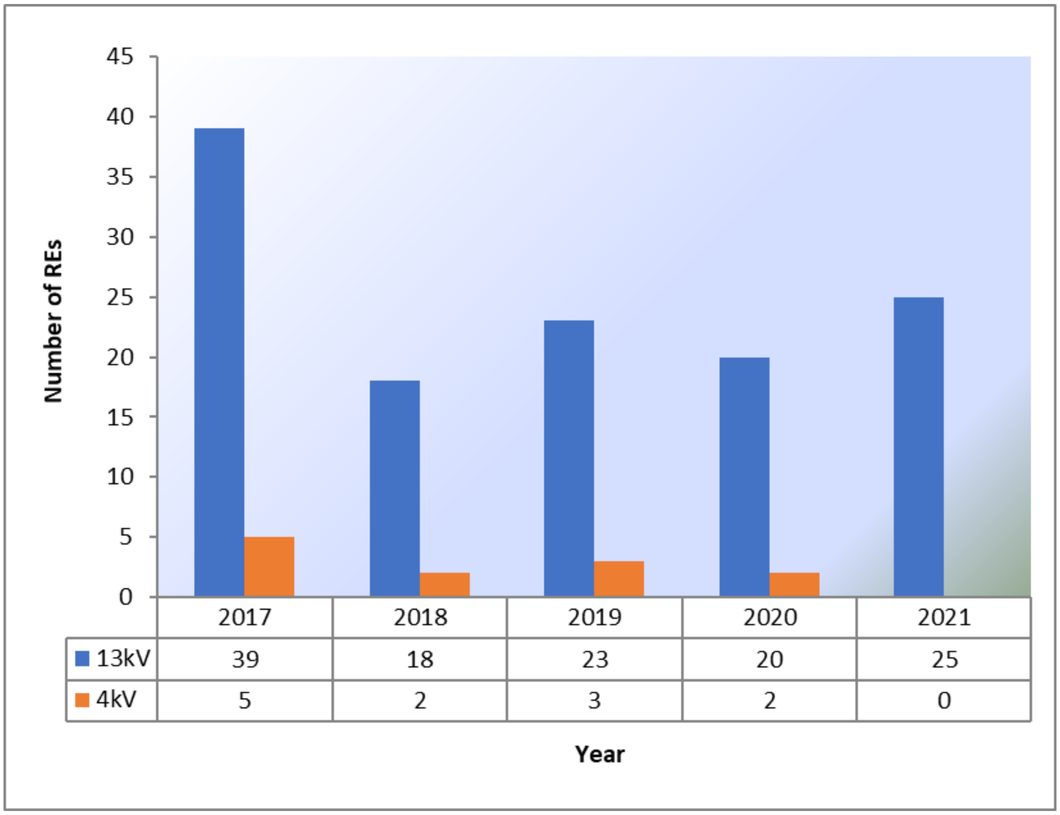
Figure 22: Insulation Type of Primary REs (2012-2021)

	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
RL	7	9	10	13	5	6	8	3	4	2
RN	7	14	30	52	20	14	22	15	5	10
Other	1	2	4	2	7	2	7	2	13	1

Year

Most reportable events involving primary equipment occur on 13 kV feeders (Figure 23). 4 kV is a vintage technology and the majority of Pepco's underground system is 13 kV.

Figure 23: Voltage Class of Primary REs (2017-2021)



In addition, moisture plays a major role in the deterioration of both primary and secondary cable insulation. When a significant amount of precipitation occurs in the District, moisture and contaminants from the street, such as motor oil, lawn chemicals, etc., enter into the manholes and affect cable insulation. Additionally, snow/ice melt chemicals ingress after a storm can also penetrate cable insulation and lead to failure. While moisture affects all cable insulation, since secondary cable is not as robust or of the same design as primary cable, secondary cable is inherently more likely to fail under adverse weather conditions. A comparison of Figures 24 and 25 suggests that total moisture accumulation affects the number of reportable events.

Figure 24: Reportable Events by Month (2017-2021)

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Year

The Failure Analysis Section will show failure analysis for all manhole incidents in the District to determine trends and remediation activities.

3.4 Slotted Manhole Covers [69]

New Slotted Manhole Cover Program Locations

In its 2013 Consolidated Report, Pepco discussed its criteria for selecting areas for installation of slotted manhole covers. This included areas with high load growth and potential business development. There were no slotted covers installed in 2021.

Historical Slotted Manhole Cover Program[70]

Pepco installed grated manhole covers over single and three-phase transformer installations, and network transformer installations in roadways and sidewalks. Their purpose is to assist in the dissipation of heat from the transformers. To explore the potential of an expanded application of vented manhole covers to non-transformer locations, Pepco contracted the Electric Power Research Institute (EPRI) to simulate manhole explosions. The simulations were specifically designed to test the effectiveness of solid, slotted and grated manhole covers in minimizing displacement of covers under fault conditions. The test data showed that the installation of slotted covers minimizes the frequency and impact of manhole events in three main ways:

1. Energy released may escape through the slotted cover without lifting or displacing it;
2. Smoke can provide an early warning of cable faults, thus preventing more serious events from occurring; or
3. Explosions or fires may be avoided by the dissipation of combustible gases.

Based on these findings, Pepco installed custom-designed, slotted manhole covers in high volume pedestrian traffic areas of the District of Columbia where the low voltage alternating current network exists. The installation of slotted manhole covers has enhanced public safety

[69] Order No. 16975 states the following at paragraphs 74 and 111:
85. Decision: …We agree with the Staff that a manhole replacement program that concluded in 2004 may no longer be appropriate, given business development in new areas of the District. We therefore require Pepco to reexamine the criteria used to select locations for the installation of slotted manhole covers and to report on this reexamination in the 2013 Consolidated Report.
114.Pepco is DIRECTED to revisit criteria used to select locations for installing slotted manhole covers consistent with paragraph 74 herein;

[70] In Order No. 16091 issued on December 10, 2010, the Commission stated among other things, at paragraph 59, the following:
59. … (4) include trend analysis for "Use of Slotted Manhole Covers;"

while minimizing potential damage to underground electric facilities. The installation program was concluded in 2004 with an overall total of 7,880 slotted manhole covers having been installed.

In Order No. 14093, the Commission approved Pepco's proposal to suspend further slotted manhole installations provided the Company submit an analysis of manhole events and failure rates associated with slotted covers, including recommended actions for 2008 by October 27, 2007, and continue to monitor debris accumulation in manholes with slotted covers. Pepco filed its analysis on August 21, 2007.

Pepco realizes that the openings in the covers, while allowing gases to vent, also allow rain, snow, dirt, debris and chemicals into manholes. As a result, Pepco continues to monitor debris accumulation in manholes with slotted covers. Of the 25 reportable manhole events that occurred in the District of Columbia in 2021, 4 involved manholes fitted with slotted covers.[74] Over the five-year period from 2017 through 2021, there were 189 reportable manhole events. Of these, 50 (26%) occurred in manholes with slotted covers. See Figure 26.

Figure 26: Manhole Events Involving Slotted Covers

	2017	2018	2019	2020	2021
All Events	44	55	43	22	25
# Events Slotted Covers	15	20	9	2	4
% Slotted	34%	36%	21%	9%	16%

Year

The rate of manhole events on these slotted covers is disproportional to the total population of these covers on the system. Currently there are slotted covers deployed on about 13% of manholes within the Pepco system yet we are consistently seeing slotted covers account for upwards of 29% of the total manhole events each year. This coupled with the fact that the current Pepco designed slotted covers are not 100% ADA compliant has led Pepco to reconsider the design for vented manhole covers.

With the support of EPRI, an Exelon utility peer group was formed to research manhole events and mitigation techniques. As a result of this research group, all Exelon utilities have aligned on a new design for vented manhole covers. These new manhole covers use a 3% vented design as compared to the current 23% slotted cover. Additionally, the new manhole cover design is fully ADA compliant.

3.5 Cable Splice or Joint Records[71]

Pepco repair crews complete a "Splice Manifest" report which records, among other things, the location, date, type of splice, the splicer's name and the foreman's name. Table 47 contains information from the "Splice Manifest" report for 2021 maintenance work performed. The splicer and foreman names have been redacted from the table.

Table 47: 2021 Splice Data (District of Columbia)

Appendix 3A: 2021 Manhole Events[72]

New Manhole Event Information

At the December 13, 2011, and February 16, 2012, PIWG meetings, it was decided that the following types of additional information related to manhole events would be included in future Consolidated Reports. The following categories of information have been included in this year's Consolidated Report.

- Incident Date
- Work Order/Request #
- Address
- Grid Number
- Feeder Number
- Manhole cover type (solid, slotted, roadway, round, sidewalk)
- Manhole Condition (clean, water below cable, water above cable, debris above cable)

---

[72] In Order No. 11716 ordering paragraph 3, the Commission ordered the following:

3. PEPCO shall file an annual report on the previous calendar year's manhole incidents;

Order No. 16975 states the following at paragraphs 72 and 110:

72. Decision: We accept the Staff's recommendation and require Pepco to include grid numbers and Siemens' inspection dates on manhole event reports. Each year over 200 manholes are selected through stratified sampling criteria and inspected by Siemens. Including grid numbers and inspection dates will help to identify manhole events traced to the manholes recently inspected, manholes located along Pepco's Priority Feeders, and manholes with and adjacent to recent manhole events. This will enhance independent/third party validation and quality assurance of the manhole inspection program.

110. Pepco is DIRECTED to provide grid numbers consistent with paragraph 72 herein;

- Voltage class (600V, 4kV, 13kV, 34kV, 69kV)
- Type of equipment (transformer, protector, cable, switch, straight joint, branch joint, trifurcating joint, transition joint, other)
- Equipment description: details specifics of the equipment such as size, insulation, phases, type of joint
- Repair description: details repair work
- A description of the failure mode (not previously recorded)
- A determination if the failure is a repeating event at this location (not previously recorded)

Pepco undertook a substantial database conversion during 2012 to make these additions to enhance summary reporting and analysis. The duration of the repair effort, which was outstanding in the database conversion effort as of the 2013 Consolidated Report, is now included within the database.

The listing of 2021 Manhole Events is provided in the following table:

Table 48

Appendix 3B: 2021 Manhole Inspection Program[73]

APPENDIX 3B - MANHOLE INSPECTION PROGRAM (MIP)

Pepco began development of its manhole inspection program in 1999. By the end of 2006, Pepco had performed a total of 79,295 inspections, completing Phase I. Phase II of the Company's Manhole Inspection Program began in 2007 and was completed in the first quarter of 2013 with a total of 69,670 inspections. Phase III of the Company's Manhole Inspection Program began in 2013 and was completed in 2018 with a total of 66,836 inspections. Phase IV of the manhole inspection program is currently underway. A total of 10,798 manholes were inspected in 2021.

Manhole inspections represent a significant undertaking that involve the visual assessment of the underground manholes and vaults and the equipment contained in them, taking load readings of low voltage cables and reviewing the integrity of cable splices. Supervisory personnel review records and corrective actions are identified and tracked. Data obtained during the inspections can be used to ascertain whether the secondary cables are overloaded or are likely to be overloaded under peak load conditions using appropriate de-rating factors and factors to simulate peak conditions. Inspections are also designed to identify load variations between phases which could indicate

[73] In Order No. 11716, the Commission stated the following:

> *PEPCO is hereby directed to include the following information in its [manhole inspection] reports beginning in July 2000:*
> 1. *The general location of the manholes inspected, including the street or streets where the manholes are located and the blocks bounding the street, e.g., M Street, NW, between 23rd and 28th streets;*
> 2. *The number of manholes inspected in the month, broken down as to the number of manholes containing primary cables only, both primary and secondary cables, and secondary cables only;*
> 3. *The number of primary cable problems found;*
> 4. *The number of secondary cable problems found;*
> 5. *The type of cable problems found in each manhole, categorized as to the physical degradation or damage of the cable, overheating, overloading, damaged splice and deteriorated cable or splice due to age;*
> 6. *The number of manholes with problems;*
> 7. *The corrective actions taken for each cable and manhole problem found; and*
> 8. *Other general condition of the manhole such as whether it contained water, oil, grease, debris, and whether the manhole cover and the manhole are in good mechanical condition.*

possible imbalanced conditions. By identifying such instances and taking appropriate actions, Pepco will continue to improve and maintain the reliability of its system.

Inspection Priority Definitions

As a result of the merger, new procedures and processes are in place across the Pepco region for planning and prioritizing corrective maintenance activities. Beginning in 2019, Pepco has adopted the Exelon work screening and prioritization practices in the manhole inspection program. All corrective maintenance reportable conditions (CMs) are classified into one of four categories under the Exelon model: P10, P20, P30, or P40. A description of each deficiency is shown below:

<u>P10:</u> Immediate response required; work item until complete or until corrective actions allow the downgrading of the priority. Priority 10 CMs should not exceed 3 days. These items have a direct and immediate impact to safety, SAIFI, or SAIDI.

<u>P20:</u> Priority 20 CMs are usually completed within 14 days and should not exceed 30 days. corrective plans shall be created for Priority 20 CMs that exceed 30 days. These items have a high probability of affecting SAIFI, SAIDI, or safety.

<u>P30:</u> Priority 30 CMs are typically completed within 9 months and should absolutely not exceed 1 year. A corrective plan shall be created for priority 30 CMs that exceed 1 year. These items have a moderate probability of affecting SAIFI or CAIDI if not addressed within a year's timeframe. For priority 30 CMs that require completion before the 9-month target, an agreed upon need date shall be established through the work screening process. All changes in proposed need date require approval.

<u>P40:</u> Work not meeting the criteria for a P10, P20, or P30 shall be considered a P40 and completed not to exceed the predominant maintenance cycle interval. Impact on SAIFI or CAIDI would only result if the condition rapidly degrades. A priority 40 CM shall not exceed 1 year past the determined preventative maintenance cycle for the associated equipment class.

Current Program Status

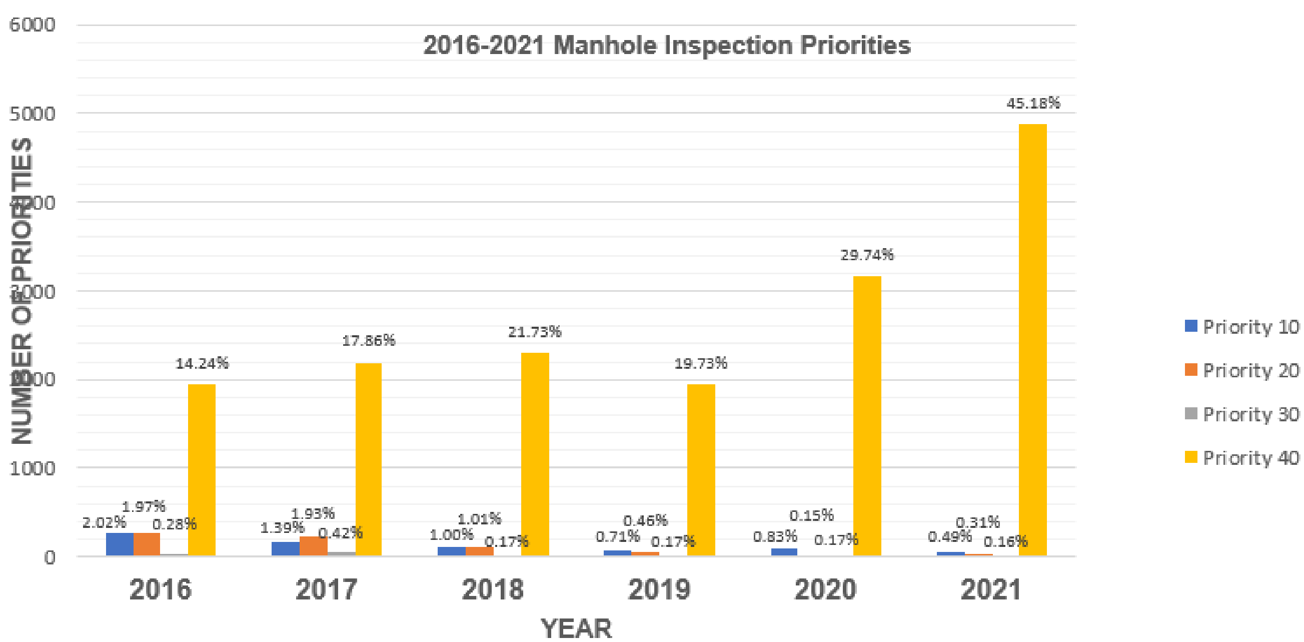
During 2021, the MIP has identified the following remediation Priorities:

Percentage of CY 2021

	Priorities Count	Priorities
Priority Code 10	53	1%
Priority Code 20	33	.6%
Priority Code 30	17	.3
Priority Code 40	4878	98%

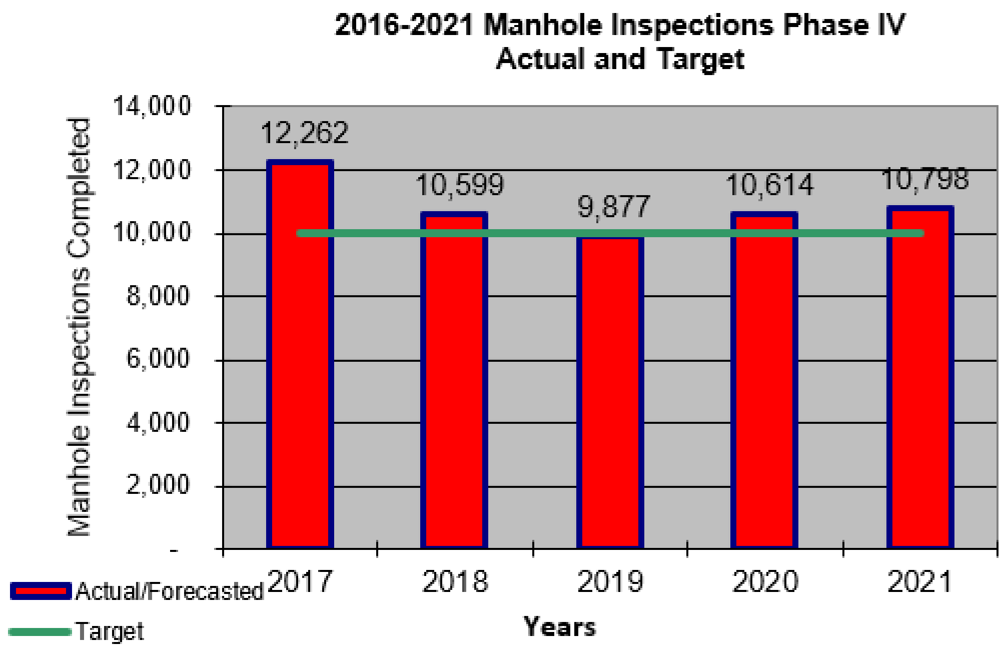
Inspectors are conducting more comprehensive and thorough inspections which have resulted in a substantial increase in Priorities found. In 2021, approximately 46% of the manholes inspected revealed potential areas of concern that have been or are in the process of being addressed. Figure 27 provides a graphical representation of the number of manholes and the percentage of overall inspections with priority conditions.

Figure 27: Manhole Inspection Priorities – Phase IV



With the implementation of the Manhole Inspection Quality Control (QC) Program, inspection Priorities have increased from 1,866 in 2015 to 4981 priorities in 2021. The majority of the increase is related to Priority 40 conditions, which are not considered an imminent risk and must be remediated within 12 months and the increase can be attributed at least in part to more rigorous inspections.

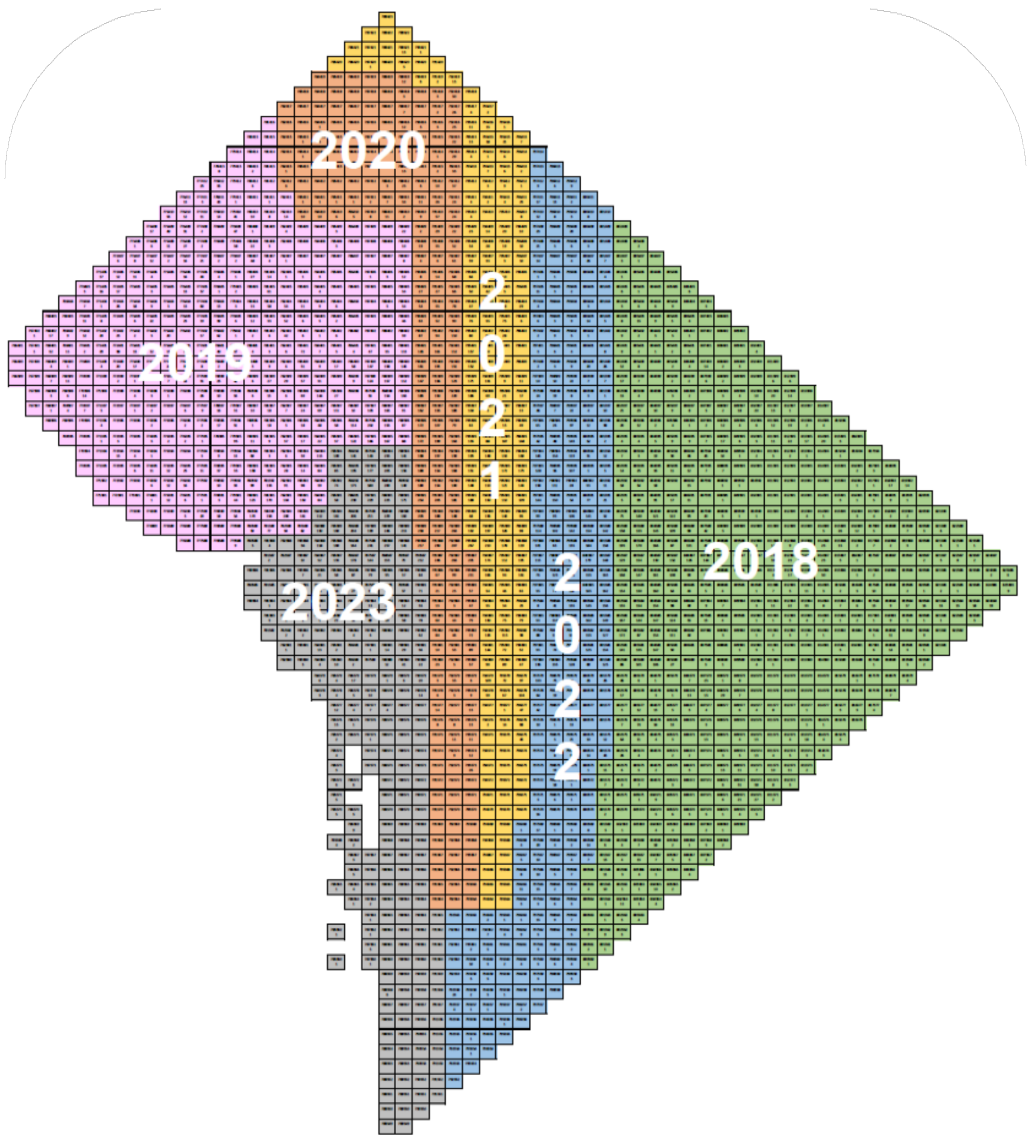
Figure 28: Manhole Inspections Completed – Phase IV



In 2017, a comprehensive analysis on the manhole population in the District was performed using GIS extracts. Using these records, a more efficient inspection plan was created for the next complete cycle in the District. Additionally, the tracking mechanism for manhole inspections was changed for inspections occurring in 2018 and forward. Previously, inspections were assigned on a 1,000' x 1,000' "plat" basis rather than by individual manholes. This left room for gaps and a small number of missing inspections. Moving forward, all manhole inspections will be tracked on an individual manhole level, leaving no room for errors or missing inspections.

With the new GIS extract that was performed, a grouping of manholes based on geographic location was performed to solidify the inspection plan for the next six years. Figure 29 below shows the manhole inspection map of the District for years 2018-2023. Each colored region has an equivalent number of manholes within it, equally divided between six inspection years. This plan will improve the crew efficiency and future corrective maintenance work planning as crews would not be able to mobilize across the city every year.

Figure 29: 2018-2023 Manhole Inspection Plan



Quality Control Program

The manhole inspection program QA/QC process is broken into three parts that is to be followed by Aldridge Electric:

- Office Review: A minimum of 15% of the inspected locations are to be reviewed in office after the inspections are complete and the information is uploaded into the manhole inspection database. This review process consists of the following:
  - Review photos to ensure quality of 360 and Still shots labeled accurately
  - Verify if manhole cleaning is required based off photos
  - Verify Output of assessment pdf is accurately filled out
  - Verify CM work
  - Verify all manhole locations deemed out of scope or missing.

- Field Inspection Review: A minimum of 8% of the inspected location are reviewed which include a review of inspectors' work (setup, assessment, safety, etc.) on site at the time of inspection, by the field leadership team.
  - 2 AE Foreman training and performing quality inspections full time
  - 1 AE General Foreman providing oversite and quality inspections when available
  - 1 AE Construction Manager overseeing subcontractor full time

- Field CM Review Process: A minimum of 7% of the inspected locations are reviewed by Foreman and PM daily with 360 completion photos to verify accuracy of work performed. A completion log is filled out by crew leader for every manhole worked.
  - 1 AE Foreman performing quality inspections full time
  - 1 AE General Foreman providing oversite and quality inspections when available
  - Verify installed items vs. called out items in assessment
  - Field Lead identifies all CM work is complete
  - Verify 360 photo taken upon completion
  - Crew leader reviewing original assessment to verify accuracy at every location visited

Appendix 3C: Network Accuracy Procedure Report[74]

[74] In Order No. 16709 paragraphs 9 and 10, the Commission ordered the following:

9. *The Commission is satisfied that Pepco has developed a reasonable plan to ensure that its underground cables are adequately sized for existing and future loads. However, we do want to monitor Pepco's diligence in performance and the results of implementation of its network modeling, GIS updates, and timely network technology improvements going forward. We, therefore, direct the Company to file periodic reports to keep the Commission and interested parties apprised of the status of several ongoing projects as follows:*
    a. *Pepco is directed to provide a detailed status report on those eight networks that are currently undergoing analysis under the Company's Network Accuracy Procedure including the corrective actions that were identified by December 2011. This report on the eight networks should be added to the Company's 2012 Consolidated Report or filed as a Supplement to the 2012 Consolidated Report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report; and*
    b. *Pepco is directed to file a detailed status report on the results of its modeling and analysis and the implementation of its remedial actions on all of its remaining networks under its Network Accuracy Procedure. This report on the remaining networks should also be added to the 2012 Consolidated Report (or filed as a Supplement to the 2012 report if the 2012 Report has already been filed or it is too late to include it for publication in the 2012 Report) with updates in each subsequent year's report. The status report on those remaining networks shall include corrective actions that have been scheduled and those that have been completed.*

THEREFORE, IT IS ORDERED THAT:

10. Pepco shall comply with the directives set forth in paragraph 9 herein.

Network Accuracy Procedure Report

Status Report of the Analysis of the Remaining District of Columbia Networks, in Accordance with the Network Accuracy Procedure.

As reported in 2021, all investigations of Pepco's LVAC networks in the District of Columbia have been completed. Pepco has adopted the network accuracy procedure and intends to continue reviewing the accuracy of the LVAC networks; however, Pepco will not report further on this procedure's results in the ACR.

SECTION 4.2 – TECHNICAL TERMS AND DIAGRAMS

This section contains definitions, explanations and diagrams used in discussing electric system operations, design characteristics, and performance.

Alternating Current (AC)

A current, which reverses at regularly recurring intervals of time and that has alternately positive and negative values.

Ampere

The "ampere" is the basic unit of current equal to the flow of one coulomb of charge passing a point in one second. It is also the amount of current that is allowed to flow when a difference of potential of one volt is applied to a resistance of one ohm.

Ampere-hour

The flow of current per hour. Ten ampere-hours is equal to the flow of 10 amperes for a period of one hour or the flow of one ampere for ten hours.

Arrester

A device that provides an alternate path for surge currents caused by over-voltage resulting from lightning or switching surges.

Battery

Two or more cells electrically connected for producing electric energy. A device that transforms chemical energy into electric energy.

Cable Joint

A connection between two or more separate lengths of cable with the conductors in one length connected individually to conductors in other lengths and with the protecting sheaths so connected as to extend protection over the joint.

Cable Rack

A device usually secured to the wall of a manhole, cable raceway, or building to provide support for cables.

Cable Splice

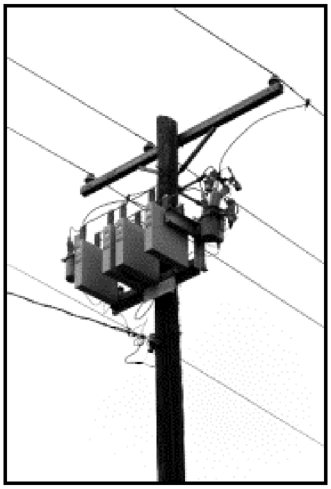
See Cable Joint

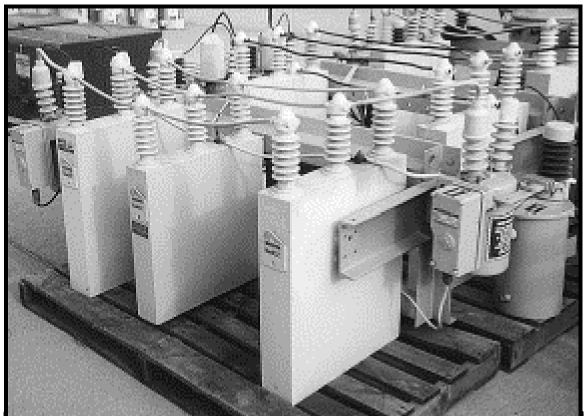
CAIDI (Customer Average Interruption Duration Index)

Represents the average time required to restore service to the average customer per sustained interruption. Mathematically equal to SAIDI divided by SAIFI.

Capacitor

An electrical device for storing a charge of electricity and returning it to the line. It is used to balance the inductance of a circuit, since its action is opposite in phase to that of inductive apparatus; it throws the current ahead of the electromotive force in phase. It is made of alternate plates of tinfoil and insulating material. The size of plates and the thickness of insulating material determine the capacity for holding electric charge. Capacity is measured, practically, in micro-farads, millionths of a farad.





Capacitors

Circuit

A conductor or system of conductors through which an electric current is intended to flow.

Circuit Breaker

A device designed to open and close a circuit by non-automatic overload of current without damage to itself when properly applied within its rating.

Conductor

A material that allows the flow of electricity; a metal wire, in the center of an electrical cable, through which current flows.

Conduit

A pipe, most often made of polyvinyl chloride, used for the installation of cables underground.

CPI (Composite Performance Index)

A distribution feeder performance measuring index created by combining 4 industry standard reliability indicators. The indicators used in CPI are Number of Interruptions (NI), Number of Customer Hours of Interruption (CHI), System Average Interruption Frequency (SAIF) and System Average Interruption Duration (SAID).

Cycle

One complete set of positive and negative values of an alternating current.

Duct

A single enclosed runway for conductors or cables.

Duct Bank

An arrangement of conduit providing one or more continuous ducts between two points.

Efficiency

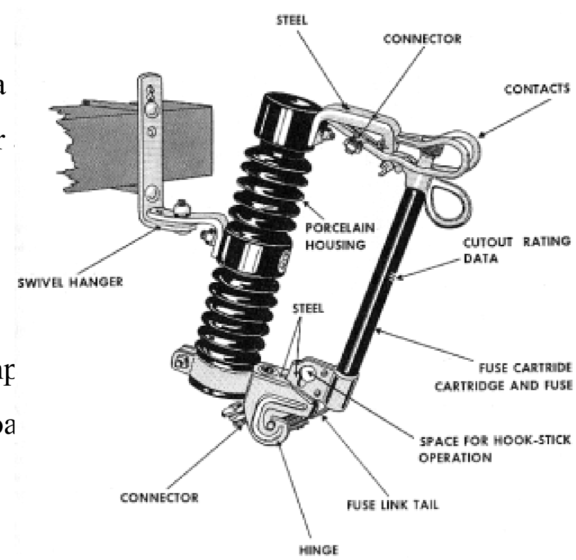
The ratio of the useful output to the input of energy, power, quantity of electricity, etc.

Fault Current

A current that flows from one conductor to ground or to another conductor owing to an abnormal connection (including an arc) between the two. Note: A fault current flowing to ground may be called a ground fault current.

Fuse

An electrical safety device consisting of, or including, a d
interrupts the circuit when the current exceeds a particular



Fuse Cutout

A device that is used to de-energize and re- energize comp h
protects the line and components from the effect of overloa

Fuse Element

The part of a fuse that melts and interrupts the circuit when excessive current flow occurs.

Ground

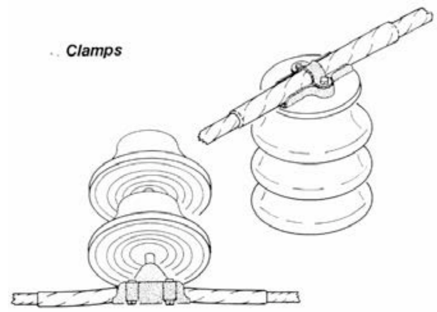
A conducting connection, whether intentional or accidental, by which an electric circuit or equipment is connected to the earth or to some conducting body that serves in place of the earth.

Inductance

The process that produces a voltage due to interaction of a conductor, a magnetic field, and relative motion between them.

Insulator

A material that offers a great deal of resistance to electron flow.



Kilowatt-Ampere (kVA)

The unit of apparent power in alternating current circuits as distinguished from kilowatts which represent true power.

Kilowatt (kW)

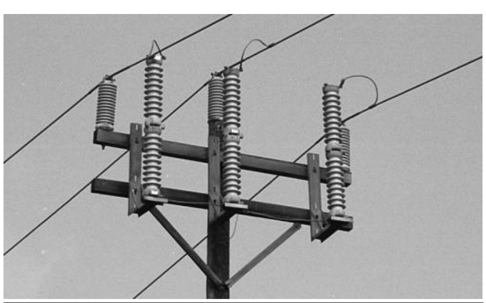
A unit of electric power equal to one thousand watts.

Kilowatt-hour (kWh)

The work performed by one kilowatt of electric power during one hour.

Lightning Arrester

A device that has the property of reducing the voltage of a surge applied to its terminals by the surge current to ground. It is capable of interrupting follow current if present and restores itself to original operating conditions.



Load Factor

The ratio of the average load over a designated period of time to the peak load occurring in that period.

Low Voltage (LV)

600 volts and lower.

Manhole

A subsurface chamber, large enough for a man to enter, in the route of one or more conduit runs and affording facilities for placing and maintaining in the runs, conductors, cables, and any associated apparatus.

Megawatt (MW)

One million watts.

Network

An aggregation of interconnected conductors consisting of feeders, mains, and services.

Overload

A load greater than the rated load of an electrical device.

Paper-Insulated Lead Cable (PILC)

A primary cable designed with paper insulation wrapped around a shielded conductor and covered with a flexible lead covering.

Phase

The relative time of change in values of current or electromotive force. Values that change exactly together are in phase. Difference in phases is expressed in degrees, a complete cycle or double reversal being taken as 360 deg. A 180-deg phase difference is complete opposition in phase.

Polychlorinated Biphenyls (PCB)

A toxic environmental contaminant requiring special handling and disposal in accordance with US Environmental Protection Agency Regulations. No longer used in transformers.

Pothead

A device used to protect the connection between a URD and an overhead system. A pothead also provides a termination for the URD cable insulation.

Power

The rate of doing work or the rate of expending energy. The unit of electrical power is the watt. Power is calculated by multiplying current time voltage.

Power Factor (pf)

The ratio of the actual power of an alternating current as measured by a wattmeter, to the apparent power, as indicated by ammeter and voltmeter reading. The power factor of an inductor, capacitor or insulator is an expression of their losses. The ratio of total watts to the total root-mean-square (RMS) volt-amperes. It is a mathematical term whose value is less than or equal to unity, or one. This term is used to show the relationship between volt-amperes (which is the basis for rating transformers, generators, etc.) and watts which is the measure of usable power delivered. A low power factor results in a lower usable power delivery or consumption for a given value of electric current than would result with a high power factor. The result of a low power factor is higher losses through the wires, cables, and other electrical apparatus.

$$pf = \frac{\sum Watts}{\sum RMS\ VoltsxAmperes}$$

Preassembled Aerial Cable (PAC)

Preassembled Aerial Cable (PAC) is an installation of three single underground cables triplexed together and installed on the overhead distribution system in heavily wooded areas. Each of the three conductors is a fully insulated cable grouped together in a package that is supported by a metallic messenger. The installation is more robust than tree wire and has the ability to withstand falling tree limbs.

Primary Circuit

The higher voltage circuit in a URD system that carries power to the transformers.

Protective Relay

A relay whose function is to detect conditions of an abnormal or dangerous nature and to initiate appropriate control circuit action.

Reactive Power

The product of voltage and the out-of-phase component of alternating current generally measured in kilovars (kVAR). Reactive power decreases the substation's ability to deliver real power and increases system losses.

Reactor

A device, the primary purpose of which is to introduce reactance into a circuit.

230 kV Reactor

Real Power

The rate, generally measured in kilowatts (kW), of generating, transferring, or using energy. The power which serves the customers' end-use electrical devices and the power for which the customer is metered.

Relay

An electric device that is designed to interpret input conditions in a prescribed manner and, after specified conditions are met, to respond to cause contact operation or similar abrupt change in associated electric control circuits.

Remote Terminal Unit (RTU)

A device that controls substation equipment.

SAIDI (System Average Interruption Duration Index)

Average time customers are interrupted. Mathematically equal to the sum of Customer Interruption Hours divided by Total Number of Customers Served.

SAIFI (System Average Interruption Frequency Index)

Average frequency of sustained interruptions per customer. Mathematically equal to the sum of Number of Customer Interruptions divided by Total Number of Customers Served.

SCADA (Supervisory Control and Data Acquisition) System

A system that allows dispatchers to monitor and control substation equipment from a central location; also provides documentation for record keeping.

Secondary

Referring to the energy output side of transformers or the conditions (voltages) usually encountered at this location.

Short-Circuit

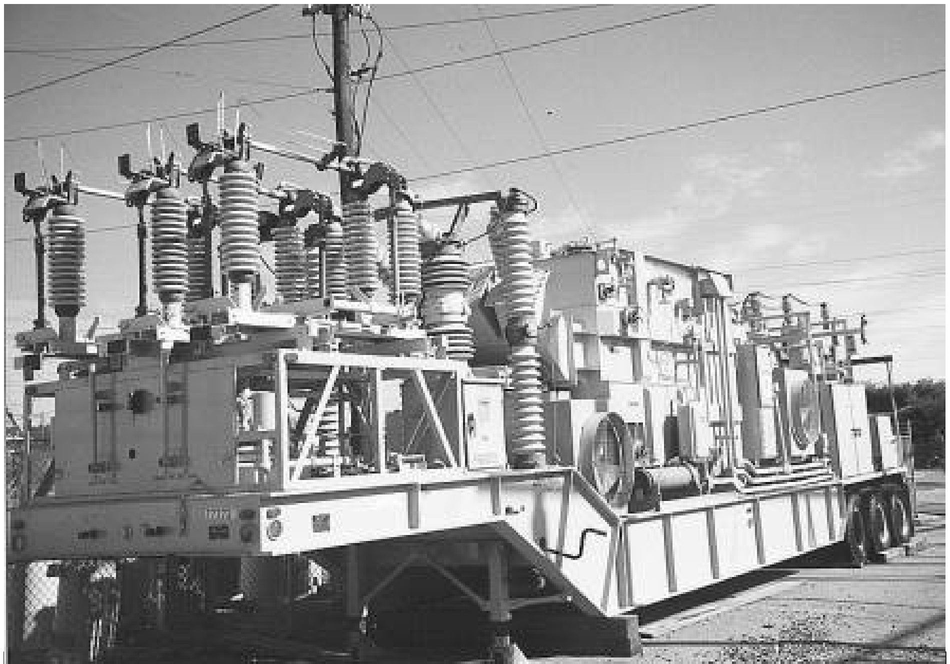
An abnormal connection of relatively low resistance, whether made accidentally or intentionally, between two points of different potential in a circuit.

Splice

A joint used for connecting in series, two lengths of conductor or cable.

Substation

An assemblage of equipment for purposes other than generation or utilization, through which electric energy in bulk is passed for the purpose of switching or modifying its characteristics. Note: A substation is of such size or complexity that it incorporates one or more buses, a multiplicity of circuit breakers, and usually is either the sole receiving point of commonly more than one supply circuit, or it sectionalizes the transmission circuits passing through it by means of circuit breakers.



Mobile Substation

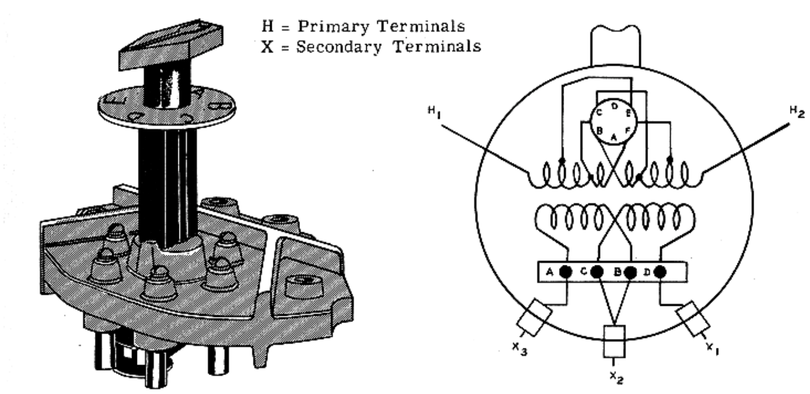
Switchgear

A general term covering switching and interrupting devices and their combination with associated control, metering, protective, and regulating devices, also assemblies of these devices with associated interconnections, accessories, enclosures, and supporting structures, used primarily in connection with the generating, transmission, distribution and conversion of electric power.

Tap

Connections that allow a transformer's turns ratio to be adjusted by adding turns to or subtracting turns from the transformer's primary or secondary winding. A connection brought out of a winding at some point between its extremities to permit changing the voltage or current ratio (general). An intermediate point in an electric circuit where a connection may be made.

A Tap Changer is Used to Adjust the Turns Ratio of a Transformer



No Load Tap Changer

Typical Internal Wiring of Transformer with Tap Changer

Tap Changer

A device for changing the turns ratio of a transformer.

Telemetering

Transmission of intelligence such as meter readings over a long distance, usually from stations to the dispatcher's office, by direct wire or carrier current.

Three-Phase Circuit

A combination of circuits energized by alternating voltages that differ in phase by one-third, that is, 120 degrees.

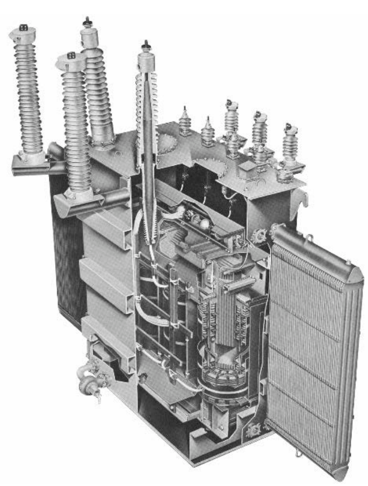
Three-Wire System

A system of electric supply comprising three conductors, one of which, known as the neutral wire, is maintained at a potential midway between the potential of the other two, referred to as the outer conductors. There are two distinct voltages of supply, one being twice the other.

Transformer

A component used to change AC voltage to meet specific requirements. A device consisting of a winding with tap or taps, or two or

more coupled windings, with or without a magnetic core, for introducing mutual coupling between electric circuits.



Transmission Line

A line used for electric-power transmission.

URD System

A local distribution system designed primarily to be buried in the ground and to serve residential customers.

VAR

Reactive volt-amperes.

Volt

Unit of measure for voltage. One volt is defined as the voltage necessary to drive a current of one ampere through a resistance of one ohm.

Voltage

Electric potential or potential difference expressed in volts.

Watt

Unit of measure for electric power, equal to the amount of power produced when one volt causes one ampere of current to flow.

Watt-hour

Basic unit used to measure electrical energy. Watt-hours are determined by multiplying power by time. One watt-hour is the amount of energy used when one watt of power is delivered to an electrical device for one hour.

SECTION 4.3 – SELECTED COMMISSION ORDERS

COMPREHENSIVE PLAN

System Planning

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. The Commission requested that the Company provide a Comprehensive Plan detailing proposed changes to the electric system for the purposes of meeting load growth or maintaining system reliability. On pages 143-144 of the hearing transcript, Pepco's witness Mr. Gausman explained the nature of the Company's existing plans for the distribution and transmission systems:

We have plans for each of our substations in D.C., and in each of those plans we address the needs for that location, what the growth forecast is, what type of construction is going to be needed for expansion in the distribution system in each of those locations… Now when you go up to the transmission level or the substation supply level, there you have a plan that is addressing a larger area of the town because you're looking at the whole capacity of the system.

The Company expanded its responses to the Commission's requests in the first filed Comprehensive Plan. Since that date, the Company's Comprehensive Plans have been expanded based on several Commission directives. The report that follows either expands upon the discussion in the initial hearings requesting the Consolidated Report or responds to subsequent Commission directives as cited below.

The following section of the report addresses system plans based on forecasted load growth.

In Order No. 12804 paragraph 53 B, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(b) Submit quarterly reports to the PIWG as well as a report in the 2004 and subsequent PIPs on its plans for implementing the recommendations for alleviating the anticipated transmission constraints identified in the RTEP report;

Load Forecasting

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, the following topics were discussed, as cited on pages 141-144 of the hearing transcript:

Comprehensive long-term planning on the underground system

Pepco's 10-year construction plans

Distribution load growth forecasts by substation

Transmission/substation supply load growth forecasts

In order No. 12735 issued on May 16, 2003 the Commission stated at paragraph 139, the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

Customer growth projections by District of Columbia wards (including historical comparisons);

Load growth projections encompassing commercial and residential development by District of Columbia wards (including historical comparisons);

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

In Order No. 12804 paragraph 53, the Commission stated the following:

The 2003 PIP is hereby APPROVED, provided that PEPCO:

Provide the projected zonal and projected default (i.e., SOS) load data for the District of Columbia to the PIWG on a quarterly basis as well as in the 2004 and subsequent PIPs;…

Power Factors

In Order No. 10133, the Commission directed Pepco to include performance factors relating to the transmission and distribution (T&D) system in future PIPs.

"PEPCO…was directed to…provide in future PIP reports forecasts of plant performance factors which are based on analyses of both the projected performance and the prior year's actual performance"(page 10, Section B).

"…the Commission finds it entirely appropriate to include performance measures for PEPCO's transmission and distribution in the mix of issues examined by the PIWG and reported in the PIP"(page 12, third paragraph).

By way of compliance with the above requirements, in the September 1993 PIWG Meeting, Pepco proposed reporting performance data on its 13 kV distribution substation power factors.

Substation

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (page 266 of the hearing transcript):

But what we were talking about here yesterday was that the comprehensive plan would include… any rebuilt substations you might have; any new substations you might have…

Distribution

In the initial November 5-7, 2001 hearings requiring the production of the Comprehensive Plan, Commissioner Meyers stated the following (pages 266-267 of the hearing transcript):

But what we were talking about here yesterday was that the comprehensive plan would include… anything that you might envision to account for distribution load growth…

In Order No. 12735 issued on May 16, 2003, the Commission stated the following at paragraphs 74 and 135:

74. During the November 2001 hearings the Commission requested that PEPCO submit a comprehensive plan to include a current assessment of, and future plans for, its underground distribution and network facilities.[179] *The Commission requested the plan as a tool to evaluate PEPCO's planning methodology and to assess PEPCO's ability to anticipate and respond to changing conditions in its underground distribution system…*

135. PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

(c) Listing of underground distribution projects, such as the Adams-Morgan neighborhood project (including budgets, time schedules, and expected benefits) by secondary vs. primary system by District of Columbia wards affected, but not specific locations;

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Technology

In Order No. 12804 paragraph 53 E, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

SCADA

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 313 of the hearing transcript, Commissioner Meyers stated the following:

We're going to ask Pepco to please include a section on reporting and monitoring in the comprehensive plan… And just as a quick for instance of this real-time systems control and data acquisition system, SCADA, what could it do? Give me a for instance there.

DA

In Order No. 12804 paragraph 53 E, the Commission stated the following:

53. The 2003 PIP is hereby APPROVED, provided that PEPCO:

(e) Provide to the PIWG, quarterly status reports on the new Technology Initiatives being undertaken by Pepco. An annual status report should be included in the 2004 and future PIPs. The status reports should include current accomplishments, plans for the future, and anticipated completion dates.

OMS

In Order No. 13422 on the 2004 Consolidated Report, paragraph 66, the Commission stated the following:

The 2004 Consolidated Report: Productivity Improvement Plan and Comprehensive Plan is hereby APPROVED, provided that PEPCO:

Report in the 2005 Consolidated Report, due February 15, 2005, on the corrective actions taken to fix the OMS;…

CIS

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 503 of the hearing transcript, Commissioner Meyers stated the following:

You've been a leader in CADS all along, computer assisted data systems. There's some discussion here about various other types of reporting and monitoring systems…

Power Delivery Information Systems Projects

In Order No. 12735, paragraph 139, the Commission stated the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:…

Listing of power delivery information system projects with implementation schedules, annual costs, and milestones;

Listing of new technology investigations with decisions, annual costs, and implementation schedules;

…The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Equipment Standards

The initial requirements for the Comprehensive Plan section of the Consolidated Report were delineated in hearings taking place from November 5-7, 2001. On page 149 of the hearing transcript, Commissioner Meyers stated that the Comprehensive Plan should include:

…not only [the 10-year underground construction budget and 4 kV to 13 kV conversion], but… incorporating standards of what you want this to look like…

Equipment Inspections

In Order No. 16091, paragraphs 46 and 63, the Commission stated the following:

46. Decision. ... we shall require that Pepco provide a list of the types of equipment for which a "run to failure" method applies and those for which a preventive method applies. (Footnote: If other maintenance methods are used, Pepco shall describe them as well.) The Commission requires that Pepco provide an explanation of why different maintenance methods apply to *different types of equipment. We also require a description of the "test procedures" that Pepco uses to assess the performance and remaining life of the equipment. (Footnote: See Pepco comments at 7.) Further, Pepco shall provide an estimate of the current book value of equipment maintained under each method used by Pepco. The 2011 Consolidated Report shall include this description of maintenance policies and methods.*

63. Pepco IS DIRECTED to provide a description of its maintenance policies and methodologies, consistent with paragraph 46 of this Order;

Storm Readiness / ERIP

In Order No. 15152 at paragraph 71, the Commission ordered the following:

71. PEPCO is DIRECTED to prepare an action plan to reduce service restoration times and improve SAIDI and CAIDI performance, consistent with Order No. 14643 issued November 30, 2007 and herein, to be included in the 2009 Consolidated Report;

Order No. 15568 followed, requiring the following:

32. The Commission directs Pepco to report to each meeting of the PIWG on its Action Plan. That report should include a written description of the steps taken pursuant to the Plan. For example, in connection with the item that includes "Develop a process design and implement training," Pepco should describe the design and the training given to crews, including the number of employees who have availed themselves of the training. In addition, Pepco should be prepared to answer questions about the progress of the Action Plan from other members of the PIWG.

52. Pepco IS DIRECTED to report to each meeting of the PIWG on its Action Plan, consistent with Paragraph 32 of this Order;

Electricity Quality of Service Standards

Specific Consolidated Report requirements from the EQSS portion of the D.C.M.R. are listed below.

Progress on current corrective action plans [on customer calls answered] shall be included in the utility's annual Consolidated Report.

The utility shall report the actual call center performance during the reporting period in the annual Consolidated Report of the following year.

Progress on any current corrective action plans [on call abandonment rates] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

The utility shall complete installation of new residential service requests within ten (10) business days of the start date for the new installation.

Progress on any current corrective action plans [on new residential service installation requests] will be included in the utility's annual Consolidated Report.

The utility shall report the actual performance obtained during the reporting period in the annual Consolidated Report of the following year.

3603.5 The utility shall report on the progress of the corrective action plan [on repeat least performing feeders] in the Annual Consolidated Report submitted to the Commission.

The utility shall report on the number and percentage of non-major service outages that extend beyond the twenty-four (24) hour standard and the reasons each such outage extended beyond the twenty-four (24) hour standard.

The report drafted pursuant to Section 3603.8 shall be included in the annual Consolidated Report on reliability data.

The utility shall report on the progress of the corrective action plan [on SAIFI, SAIDI and CAIDI benchmarks] in the annual Consolidated Report submitted to the Commission.

The utility shall also, per the orders of the Commission, continue current requirements of reporting annual reliability indices of SAIFI, SAIDI and CAIDI (with and without major events) in the annual Consolidated Report of the following year.

Industry Comparisons

In Order No. 15568 paragraph 57, the Commission ordered the following:

57. Pepco IS DIRECTED to provide a report on the Electric Utilities Best Practices, consistent with Paragraph 50 of this Order. This report shall be included in that 2010 Consolidated Report; and shall include the best practices of the electric utility industry on improving reliability and outage restoration (from the Benchmarking Studies). Pepco shall submit a continuous improvement plan, including resourcing, specific performance targets, and milestone dates to achieve the reliability and outage restoration performance of the best (quartile) performing (comparable) utilities in the Benchmarking Studies.

Implementation of Twenty Best Practices

In Order No. 16091 paragraph 61, the Commission stated the following:

61. Pepco IS DIRECTED to include a "2011 Best Practices Report" in its 2011 Consolidated Report describing its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program, consistent with Paragraph 22 of this Order;

22. Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568. Second, as to the Staff's Recommendation that Pepco file a "Best Practices Report" from the PA Consulting's 2009 Polaris Transmission and Distribution Benchmarking Program, we agree that a report may be helpful in assuring that best practices continue to be implemented. Therefore, the

Commission shall require that Pepco include in its 2011 Consolidated Report a section entitled "2011 Best Practices Report" in which Pepco shall describe its on-going implementation of no fewer than twenty of the best practices identified in the 2009 Polaris Program included in the 2010 Consolidated Report as Appendix 2D. The twenty best practices selected by Pepco should be those judged to have the most impact on reliability and outage restoration performance. Pepco shall report on all its activities during 2010 to implement these best practices, including data on staffing levels, expenses and results. This requirement is separate from the requirement to produce a "Continuous Improvement Plan," as is described more fully in Section IV.A.1.f.

PA Consulting Recommendations

In Order No. 15632 issued in these proceedings, the Commission states at paragraph 5 the following:

5. Pepco shall file with the Company's annual Consolidated Reports to the Commission data on the Company's measures to continue to address each of the recommendations made by PA Consulting and the effectiveness of the Company's approaches to improve CAIDI and SAIDI to at least the average of PA Consulting benchmarks. This obligation shall begin with the 2010 Consolidated Report.

In Order No. 15568 issued October 7, 2009 in these proceedings, the Commission states at paragraph 52 the following:

*52. Pepco IS **DIRECTED** to report to each meeting of the PIWG on its Action Plan, consistent with Paragraph 32 of this Order;*

32. The Commission directs Pepco to report to each meeting of the PIWG on its Action Plan. That report should include a written description of steps taken pursuant to the Plan. For example, in *connection with the item that includes "Develop a process design and implement training." Pepco should describe the design and the training given to the crews, including the number of employees who have availed themselves of the training. In addition, Pepco should be prepared to answer questions about the progress of the Action Plan from other members of the PIWG.*

In Order No. 16091 issued in these proceedings, the Commission states at paragraph 22 the following:

22. *Decision. First, we conclude that Pepco has complied with the requirements of Paragraphs 32 and 52 of Order No. 15568.*

PRODUCTIVITY IMPROVEMENT PLAN

Productivity Improvement Plan

In Order No. 15152 on the 2008 Consolidated Report, paragraph 68, the Commission ordered the following:

The Productivity Improvement Working Group, which includes OPC, provided a reasonable definition of a productivity improvement project in 2006. Specifically, the PIWG states:

T&D productivity improvement projects were considered those projects that will increase T&D system efficiency by reducing losses and improve[ing] system reliability, and which may defer more costly additions to the electric system. (Footnote: F.C. No. 766, Decision on Consideration of OPC's T&D Productivity Improvement Working Group in Response to Commission Order No. 13754, filed July 6, 2006 ("2006 PIWG Report"), at 2.)

The power serving the District's Standard Offer Service customers is now procured through a wholesale procurement process by PEPCO and, as such, productivity improvement is applicable only to transmission and distribution issues. We find the PIWG's definition of a productivity improvement project workable and adopt it here.

The PIWG also provided a reasonable definition of comparative cost analysis for reliability projects. The PIWG suggested that the comparative cost analysis used for reliability projects should "consist *of a comparison of the cost of alternative reliability improvement solutions as well as any differences in relative reliability improvement." (Footnote: 2006 PIWG Report at 2.) …*

Reliability Statistics

Page 190 of the transcript for the November 5-7, 2001, hearings documents Commissioner Cartagena as stating the following:

You testified earlier that you have a 10-year plan for updating the system or addressing whatever changes are required with regards to that. Does that 10-year plan contain reliability goals or other measurable performance objectives? In other words, are there some kinds of standards that we can look at and will give us an idea of whether the company is hitting or missing those standards and objectives with regards to its plan?

This section of the Consolidated Report addresses the Company's performance with respect to reliability standards and Electricity Quality of Service Standards.

Targeted Reliability Indices

In Order No. 12735, paragraph 139, the Commission ordered the following:

PEPCO shall file the additional information not included in its expurgated comprehensive plan as outlined below, within three months of the issuance date of this Report and Order:

Targeted reliability indices (including historical comparisons); and

The summary should cover a 10-year planning horizon while historical comparisons should provide at least five years of history.

Also, in paragraph 142, the Commission directed the Company to file performance indices for the District of Columbia only.

PEPCO is DIRECTED to work with the PIWG to develop target system reliability indices for the District of Columbia, only.

Vegetation Management

In Order No. 15621 at paragraph 5, the Commission ordered the following:

5. Pepco shall file within the Company's annual Consolidated Reports to the Commission, yearly data on tree trimming by feeder and wards (or multiple wards) compared to the Company's *tree down and tree limb outage causes listed in its monthly power outage reports beginning with the Company's 2010 Consolidated Report.*

Priority Feeders & Aggressive Initiatives

The Electricity Quality of Service Standard D.C.M.R. 3603.6 states the following:

3603.6 The utility shall continue the current reporting of the worst performing (lowest two (2) percent) feeders (utility methodology) and corresponding corrective action plans, with the action taken in year 1 and the subsequent performance in year 2 in the annual Consolidated Report.

In Order No. 15152 paragraph 73, the Commission ordered the following:

73. Pepco is DIRECTED to investigate the viability of the "aggressive" initiatives for all least performing feeders, to file a progress report regarding the implementation of these initiatives where viable as part of the 2009 Consolidated Report, and to file quarterly progress reports thereafter, consistent with paragraph 62 of this Order;

In Order No. 15809 paragraph 11, the Commission ordered the following:

11. Pepco IS DIRECTED to include in its 2011 Consolidated Report a plan for development and application of "aggressive initiatives" to its underground distribution feeders;

Repeat Priority Feeders

In Order No. 15152 issued on Pepco's 2008 Consolidated Report, the Commission stated (at paragraph 72),

*72. PEPCO is **DIRECTED**, beginning with the 2009 Consolidated Report, to identify the feeders that are part of the separate annual program of corrective actions for reappearing least reliable feeders, describe the corrective actions planned for each feeder and the projected dates for completion of the corrective actions and explain whether the corrective actions improved the performance of these feeders consistent with paragraph 59 of this Order;*

In Order No. 15941 issued on August 18, 2010, the Commission stated at paragraphs 13 and 16, the following:

13. Beginning with the 2011 Consolidated Report, Pepco shall identify any feeders that have appeared more than once on the Priority Feeder List, by year from the first Priority Feeder List in 2002, so that it shall be apparent how many times each feeder has appeared on the Priority Feeder List…

16. Pepco IS DIRECTED to identify in its 2011 and successive Consolidated Reports, each feeder that has appeared more than once on the Priority Feeder List.

4 to 13 kV Conversions

These projects are a continuation of the 2011 Reliability Projects, as required by Order No. 16091 at paragraph 64 and referenced paragraphs 50 and 53:

*64. Pepco IS **DIRECTED** to provide detailed schedules and budgets for conversion projects, as well as justification for any non-minor deviations from these , consistent with Paragraphs 50 and 53 of this Order;*

50. <u>Decision.</u> We agree with the Staff recommendation and require Pepco to provide justification for any deviations from the plan schedules and annual budgets for 4 kV to 13 kV conversion projects in its Consolidated

Reports, excluding minor deviations of less than 5%. This information may be provided in the discussion of "Reliability Projects."

53. Decision. ...we have not adopted the Staff's "replace or rebuild" recommendation. However, we agree that future Consolidated Reports should contain detailed schedules and budgets for Reliability Projects, as well as justification for deviations from those schedules and budgets. We shall require Pepco to submit such schedules in future Consolidated Reports.

Manhole Event Report

In Order No. 16091 issued on December 10, 2010, the Commission stated at paragraphs 56, 59, 65, and 66 the following:

56. Decision. Pepco has agreed to make the recommended changes in the 2011 Consolidated Report with the exception of data on failure rates. We require that the members of the PIWG discuss the need for and feasibility of providing data on failure rates in future Consolidated Reports and include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.

59. Decision. We adopt the Staff's recommendation and require Pepco to: (1) combine the Manhole Events portion of the failure analysis report with Part 3 of the Consolidated Report; (2) include data in the 2011 Consolidated Report that separates 4 kV primary failures from 13 kV primary failures; (3) include data in the 2011 Consolidated Report that separates 4 kV from 13 kV manhole events; (4) include trend analyses for "Use of Slotted Manhole Covers;" and (5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable. If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require *the members of PIWG to discuss the need for and the availability of such data include in the 2011 Consolidated Report the PIWG conclusions and recommendations, if any.*

Pepco IS DIRECTED to include a discussion of failure data rates in the agenda for the Productivity Improvement Working Group, consistent with Paragraphs 56 and 59 of this Order; and

Pepco IS DIRECTED to include additional Manhole Event data in the 2011 Consolidated Report, consistent with Paragraph 59 of this Order.

In Order No. 15152 paragraphs 76 and 66, the Commission ordered the following:

76. PEPCO is DIRECTED to include as part of the 2009 Consolidated Report a proposed plan for significantly reducing manhole events consistent with paragraph 66 of this Order…

In Order No. 12735, paragraph 138, the Commission ordered the following:

Pepco shall file a report that summarizes the results of the failure analyses conducted for the calendar year 2002, 30 days from the issuance date of this Report and Order, and subsequently, to file an annual report on the results of the failure analysis group to the PIWG;

Slotted Manhole Covers

In Order No. 16091 issued on December 10, 2010, the Commission stated among other things, at paragraph 59, the following:

59. …(4) include trend analyses for "Use of Slotted Manhole Covers;" 60.

Cable Splice or Joint Database

In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. *...(5) include in the Cable Splice or Joint Database section of the Consolidated Report, cable type, age, type of splice and other pertinent information, except that cable type and age can be excluded if unavailable.*

Failure Rates

In Order No. 16091, the Commission stated among other things, at paragraph 59, the following:

59. ...(5)...If data on failure rates for all variables is available for manhole events, Pepco shall include such information in its 2011 Consolidated Report. If such data is unavailable, we require the members of PIWG to discuss the need for and the availability of such data include in the

2011 Consolidated Report the PIWG conclusions and recommendations, if any.

Appendix 3A –Manhole Events and Summary of Selected Failures

In Order No. 11716 ordering paragraph 3, the Commission ordered the following:

PEPCO shall file an annual report on the previous calendar year's manhole incidents;

Appendix 3B – Manhole Inspection Program

In Order No. 11716, the Commission stated the following:

PEPCO is hereby directed to include the following information in its [manhole inspection] reports beginning in July 2000:

The general location of the manholes inspected, including the street or streets where the manholes are located and the blocks bounding the street, e.g., M Street, NW, between 23rd and 28th streets;

The number of manholes inspected in the month, broken down as to the number of manholes containing primary cables only, both primary and secondary cables, and secondary cables only;

The number of primary cable problems found;

The number of secondary cable problems found;

The type of cable problems found in each manhole, categorized as to the physical degradation or damage of the cable, overheating, overloading, damaged splice and deteriorated cable or splice due to age;

The number of manholes with problems;

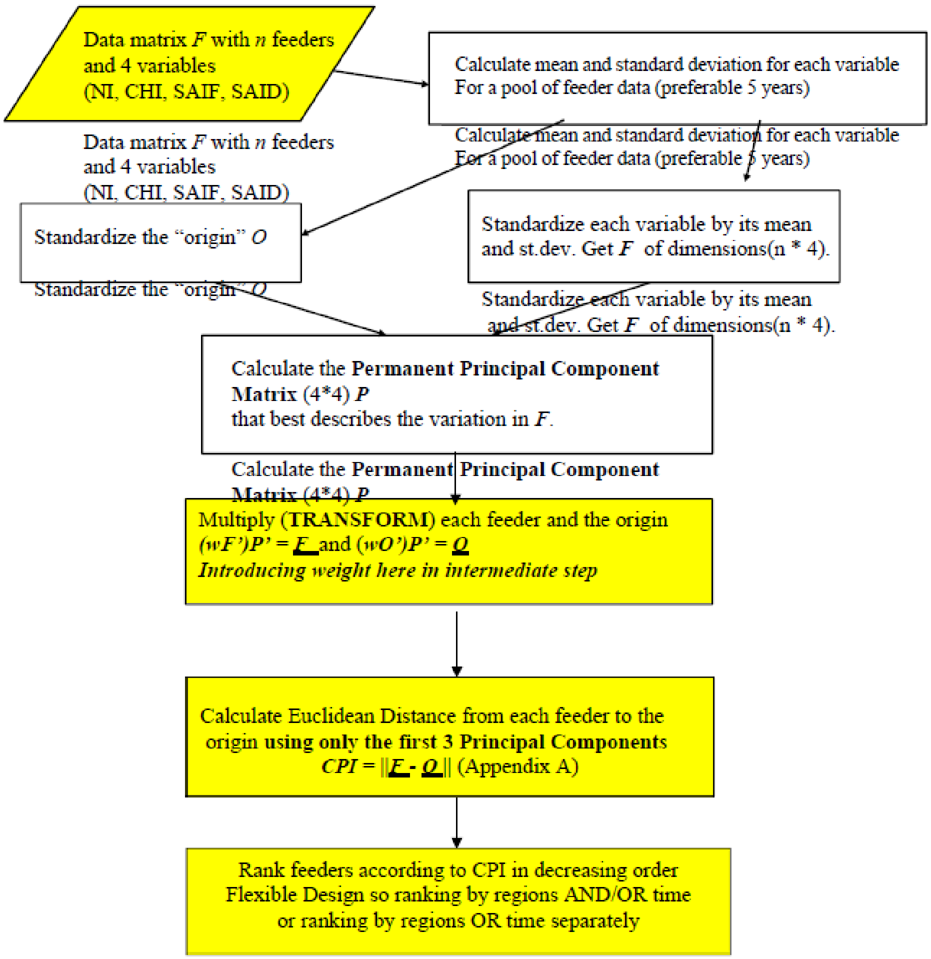
The corrective actions taken for each cable and manhole problem found; and

8. *Other general condition of the manhole such as whether it contained water, oil, grease, debris, and whether the manhole cover and the manhole are in good mechanical condition.*

Description of Calculation Process

The following flow chart (Figure 4.4-B) illustrates the process for calculating the Composite Performance Index for a feeder.

Figure 4.4-B -- Illustration of CPI Concep



Description of Euclidean Distance to Derive CPI

Definitions

Principal Component Matrix (each row is Principal Component vector)

$$P = \begin{bmatrix} PC_1 \\ PC_2 \\ PC_3 \\ PC_4 \end{bmatrix} = \begin{bmatrix} pc_{1,NI} & pc_{1,CHI} & pc_{1,SAIF} & pc_{1,SAID} \\ pc_{2,NI} & pc_{2,CHI} & pc_{2,SAIF} & pc_{2,SAID} \\ pc_{3,NI} & pc_{3,CHI} & pc_{3,SAIF} & pc_{3,SAID} \\ pc_{4,NI} & pc_{4,CHI} & pc_{4,SAIF} & pc_{4,SAID} \end{bmatrix}$$

Original Feeder Data

$$originalFeeders = F = \begin{bmatrix} f_{1,NI} & f_{1,CHI} & f_{1,SAIF} & f_{1,SAID} \\ f_{2,NI} & . & . & . \\ . & . & . & . \\ f_{n,NI} & . & . & f_{n,SAID} \end{bmatrix}$$

Weight

$$W = \begin{bmatrix} w_{NI} & 0 & 0 & 0 \\ 0 & w_{CHI} & 0 & 0 \\ 0 & 0 & w_{SAIF} & 0 \\ 0 & 0 & 0 & w_{SAID} \end{bmatrix}$$

Standard Deviation

$$\Sigma = \begin{bmatrix} \sigma_{NI} & 0 & 0 & 0 \\ 0 & \sigma_{CHI} & 0 & 0 \\ 0 & 0 & \sigma_{SAIF} & 0 \\ 0 & 0 & 0 & \sigma_{SAID} \end{bmatrix}$$

Intermediate Calculations

$$M = \Sigma * W = \begin{bmatrix} \sigma_{NI} & 0 & 0 & 0 \\ 0 & \frac{w_{CHI}}{\sigma_{CHI}} & 0 & 0 \\ 0 & 0 & \frac{w_{SAIF}}{\sigma_{SAIF}} & 0 \\ 0 & 0 & 0 & \frac{w_{SAID}}{\sigma_{SAID}} \end{bmatrix}$$

Transformation

$$\hat{F} = F * M * P'$$

$$\hat{F} = \begin{bmatrix} f_{1a} & f_{1b} & f_{1c} & f_{1d} \\ f_{2a} & . & . & . \\ . & . & . & . \\ f_{na} & . & . & f_{nd} \end{bmatrix}$$

Where

F is the original feeder data matrix (size n*4)

M is the intermediate calculation matrix (size 4*4)

P' is the (transposed) principal component matrix (size 4*4)

Finalization of CPI – Euclidean Distance Method

For each feeder *i* take the values for the 3 first components of row *i* in the last matrix above.

$$CPI_{f_i} = \sqrt{f_{ia}^2 + f_{ib}^2 + f_{ic}^2}$$

FACT SHEET

PHI

ENVIRONMENTAL STEWARDSHIP & SUSTAINABILITY:

VEGETATION MANAGEMENT ON RIGHTS-OF-WAY

A reliable supply of electricity is essential to the safety, security, economy and welfare of our nation and the communities where we live and work. To ensure the safe and reliable delivery of electricity to our customers, PHI must manage vegetation near its transmission and distribution lines and other facilities to prevent interruptions, blackouts and wildfires. PHI's regulated power delivery operations are required to maintain transmission and distribution rights-of-way so that trees, shrubs and other vegetation do not pose preventable hazards to power lines, poles or other facilities. PHI uses "best practices" to manage vegetation around electricity infrastructure, selecting among mechanical, chemical (herbicides), cultural, and biological control methods for the most suitable approach to meeting safety and reliability needs while maintaining or improving habitats for the region's indigenous flora and fauna. PHI employs professional, certified foresters and arborists to administer their vegetation management program.

VEGETATION MANAGEMENT: THE BASICS

- Utilities maintain right-of-way lands on a regular basis in order to provide for the safe transmission and distribution of electricity.
- Utilities must identify and utilize the most direct, least intrusive route possible when constructing power lines, in order to minimize both the amount of land used and any environmental impact.
- Trees and other vegetation beneath power lines must be properly maintained to avoid causing interruptions of electric service by growing into, falling through or knocking down power lines.
- In cooperation with federal, state, and local authorities, PHI, like most utilities, implements integrated vegetation management strategies to minimize overall risk to people and the environment while providing safe and reliable electric service.

HOW DOES PHI MANAGE VEGETATION NEAR ITS POWER LINES?

- PHI carefully selects vegetation management practices that balance environmental concerns, public needs, safety and cost-effectiveness.
- PHI partners with state, regional and local groups to create and maintain numerous natural habitats on its rights-of-way.
- PHI minimizes the use of EPA-approved herbicides through the selection and use of proper application methods, equipment and technology.

- PHI promotes native flora and fauna through intergrated vegetation management of our rights-of-way;
- PHI enhances vegetation management projects through cultivation or planting of compatible native vegetation;
- PHI protects native rare species populations that could otherwise be impacted by rights-of-way establishment, construction or maintenance;
- PHI manages rights-of-way areas to maintain wildlife habitat and protect threatened and endangered species habitat; and
- PHI reduces the introduction and control the spread of nonnative invasive species or noxious weeds in rights-of-way and adjacent lands.

Recognized Excellence

- All PHI utilities (Atlantic City Electric, Delmarva Power and Pepco) are active in community outreach and educational efforts to promote its **Right Tree, Right Place** initiative. **Right Tree, Right Place** advocates planting each tree species where it will thrive and not planting large species where they will interfere with power lines once they reach mature height.
- All PHI utilities have been named **Tree Line USA** Utilities by the Arbor Day Foundation. The Tree Line program is sponsored by the foundation in cooperation with the National Association of State Foresters. It recognizes utilities that demonstrate a program of quality tree care, annual tree worker training, public education, tree planting, and energy conservation through tree planting.
- PHI has longstanding commitments to vegetation management and green infrastructure efforts to help promote the sequestration of carbon dioxide by trees and other vegetation to stabilize and gradually reduce greenhouse gas emissions.

ATTACHMENT D

Pepco 2021 Safety Merger Commitments

The following attachments reflect the Company's compliance with the merger commitment described in Order No. 18148 Attachment B at P 60, Safety:[1]

Exelon is committed to having all its utilities achieve and maintain first quartile performance in safety. Consistent therewith, Pepco will file annual reports on its safety performance and safety initiatives with the Commission as part of its Annual Consolidated Report and will also present this information to the PIWG. Pepco's reporting will include a report by Exelon on its existing safety and cybersecurity policies.

- Exelon Corporate Safety Policy
- Exelon Safety Update
- Pepco Transmission and Distribution Safety Incident rate, Including Edison Electric Institute (EEI) 2012-2021 Rankings
- Exelon Cyber-Security Statement

[1] In the Matter of the Joint Application of Exelon Corporation, Pepco Holdings, Inc., Potomac Electric Power Company, Exelon Energy Delivery Company, LLC and New Special Purpose Entity, LLC for Authorization and Approval of Proposed Merger Transaction, Formal Case No. 1119, Order No. 18148, March 23, 2016, Attachment B at P 60

Exelon®

Dedicated to Safety

Corporate Policy: Safety

Policy Statement

Exelon Corporation will operate all aspects of its businesses in a manner that protects the safety and health of its employees, contractors, customers and the general public. We will foster a safety culture in which everyone believes and demonstrates that accidents, injuries and occupational illnesses are preventable and all employees understand their responsibility for maintaining a safe and healthful workplace. Further, each employee recognizes and accepts his/her right and obligation to question, stop and correct any unsafe conditions or behaviors.

Policy Intent

Exelon shall:

- Create a safety culture to achieve an accident, injury and occupational illness-free workplace;
- Comply with all applicable health and safety laws and regulations, industry and internal company standards, at a minimum;
- Integrate safety risk analysis into business planning, engineering design, and operating decisions, to develop and implement effective hazard control measures and safety performance improvement, engineering out hazards where feasible;
- Promote the value of employee empowerment in the prevention of injuries and illnesses, and maintain an open and honest dialogue with our employees on health and safety issues and performance; and
- Continually improve safety performance to become the safest electric and gas utility in the United States.

Implementation

This policy shall be implemented by establishing and maintaining:

- A corporate-wide safety program that will be integral to the Exelon Management Model based on external standards and best practices;
- Safety councils and committees, including the Exelon Operations Council, to encourage management sponsorship and employee involvement in injury and illness prevention;
- Annual objectives and targets for measuring and continually improving safety performance and recognition of top performing departments and individuals for safety is routine;
- An independent, corporate audit program and business unit self-assessments;
- Safety and health hazard evaluation programs including documented methods for controlling known safety and health hazards;
- Communications and Corrective Action Programs that facilitate the identification and resolution of safety related concerns;
- Training programs for employees and education programs for contractors on safety expectations and responsibilities;
- Employee and management personal accountability for following health and safety fundamentals and procedures; and
- Promote electricity and gas hazard awareness and accident prevention through public safety programs.

To anonymously report any safety concerns, employees or others working on behalf of Exelon can call the Exelon Helpline at 800.233.8442.

Exelon Safety Update

Exelon is committed to having all its utilities achieve and maintain first quartile performance in safety. As of the end of 2021, Pepco had a 17% reduction in OSHA recordable injuries, 36% reduction in Days Away Restricted Time Cases and the best safety performance post-merger.

Safety emphasis in 2021:

- Focused observation initiative implemented by leadership to ensure employee adherence to required COVID-19 PPE behaviors within field teams and crews.
- Alignment with other Exelon Utilities on screening strategy for employees working in high-density, critical infrastructure workspaces
- Developed shift work strategies that promote less employee interaction while maintaining necessary support levels.
- Participated with the other Exelon Utilities to continue to align safety best practices that were researched and benchmarked against Edison Electric Institute and American Gas Association utilities.
- Sustained Performance Assessment Programs by sharing incidents, lessons learned, and best practices across Exelon utilities through common communication channels.
- Continued the Ergonomic Coach program to provide Triage Support as needed in PHI overhead line school and field crews.
- PHI expanded driver training technologies and continues to leverage driver monitoring system.

Exelon has an established management model that governs key operational areas throughout the enterprise, including the safety function. The corporate Safety Policy, applicable to all Exelon operations, including Pepco Holdings and Pepco, establishes the framework for defining Exelon's industrial safety culture and sets expectations for continuously improving safety performance. It clearly sets expectations for each employee to take personal responsibility for his or her safety.

Underpinning the Safety Policy is the Corporate Industrial Safety Program, which delineates Exelon's requirements for the management of safety for the enterprise and which is based on recognized industry standards including BSI-OHSAS 18001, OSHA Voluntary Protection Program and ANSI Z10.

Detailed procedures (*e.g.*, Hazards Assessments) are maintained to affect the Safety Policy and programs, and they are routinely evaluated to ensure that best practices are utilized.

To ensure alignment and to facilitate learning, a Corporate Safety Council comprised of safety officers from each business addresses strategic safety issues, and a Corporate Safety Peer Group comprised of safety professionals and managers focuses on operational experience and use of best practices. Pepco is represented on both functions. In addition, the Exelon Utilities have a Safety Peer Group, with representation from each utility, who concentrate on improving safety performance in their specific operations.

As part of the safety performance oversight function, Exelon's enterprise-wide safety performance is reviewed at Quarterly Management Meetings (QMM) and a comprehensive review of the effectiveness of the safety policy and program is reviewed with the senior leadership team annually.

Further, the Exelon Environmental, Health & Safety Audit Program conducts independent assessments of the effectiveness of Exelon's compliance programs at a select number of locations annually. The results of the audits are reported to senior leadership, who have responsibility for affecting any corrective actions required.

Pepco Transmission and Distribution Incident Rate, Including Edison Electric Institute (EEI) Rankings

Year	Incident Rate	EEI Quartile Ranking
2012	1.89	Third Quartile
2013	1.79	Third Quartile
2014	1.52	Third Quartile
2015	1.68	Fourth Quartile
2016	2.16	Fourth Quartile
2017	1.51	Third Quartile
2018	1.20	Third Quartile
2019	1.05	Second Quartile
2020	0.94	Second Quartile
2021	0.82	First Quartile

Exelon Cyber-Security Statement

As one of the nation’s major critical infrastructure providers, Exelon recognizes that the safety, reliability and security of our systems and facilities are a top priority. The company utilizes a risk- based, intelligence-driven security approach to implementing a comprehensive set of cyber and physical security controls, in line with the National Institute of Standards and Technology’s (NIST) Cybersecurity Framework to effectively identify, protect, detect, respond to and recover from a spectrum of threats, mitigating the likelihood of successful attacks and their potential impacts. In addition, Exelon has implemented the mandatory regulatory requirements defined within the NERC CIP and NRC standards, ensuring further protection of cyber assets critical to the safe and reliable operation of the BES and Nuclear from cyber threats. Regulated critical cyber assets are isolated within restricted networks, segmented from the enterprise IT environment and the Internet, continuously monitored for malicious activity, and routinely evaluated for vulnerabilities.

Re: <u>Pepco-DC Vegetation Management</u>

Dear Ms. Westbrook-Sedgwick:

In accordance with Order No. 19119, and Pepco's December 20, 2017, letter electing to adopt performance-based vegetation management reporting, I, Bill Sullivan, hereby verify that Pepco has in place a comprehensive vegetation management plan, which is fully implemented and was in place in 2021, and that its practices during 2021 conformed to the plan.

Sincerely,

Will Sull

ATTACHMENT F

I. Downtown Resupply Detailed plan and Scope of the Project:

The Downtown Resupply project will replace aging 34 kV and 69 kV supply feeders to the L Street, F Street, and Georgetown Substations. This work along with upgrades to the F Street Substation and extension of new 13 kV feeders will accommodate load transfers from I Street Substation as well as increasing sub-transmission supply capacity and providing reliability benefits to the District of Columbia by replacing aging infrastructure to reduce the number outages.

II. Downtown Resupply description of the reliability and resiliency benefits including the effects on global climate change and the District's public climate commitments:

As climate change accelerates, Pepco's electric system will face higher demands from the more frequent extreme weather events that could leave customers exposed to more frequent outages. As a company with significant assets and critical energy infrastructure in the District of Columbia and as a major employer, Pepco has a responsibility to create a reliable, resilient grid.

Pepco has taken several initiatives to enhance reliability and resilience, among them is replacing aging cables with new, more reliable, and environmentally friendly cable. In the year 2013, conducted a system-wide cable study to determine the age and condition of the self-contained cables in the Pepco Holdings service territory, including the District of Columbia. The result of the study showed that the existing cables to Champlain, "F" Street, "L" Street and Georgetown Substations need replacement because they are considered at-risk cables in the District.[1] The main drivers for the replacement of self-contained cables are system age, environmental concerns, capacity limitations, maintainability, material availability, and limited supply of skilled labor to work on the current cable.[2] For example, the existing supply lines from Potomac River Station C to Georgetown substation require monitoring of the pressure and hydraulic systems. Based on non-invasive inspections and testing of the alarm's gauges, Pepco personnel must regularly add fluid to those supply lines to maintain adequate pressure levels to keep supply lines in operation. The Downtown Resupply project will use dual-circuit duct banks with XLPE insulated cables. XLPE cables have significant operational and environmental benefits over previously used SCFF and HPPT cables, including lower capacitance, higher load-carrying capability, no need for insulating fluid, and lower maintenance costs.

In addition to the concern of aging infrastructure requiring the replacement of these cables, Downtown Resupply will continue to mitigate instances of single points of failure on our system. By having cables contained in a single point, the substation supplies are susceptible to damage, increasing the risk of losing power to the customers connected to a substation in which all the cables are in the same duct bank. Downtown Resupply mitigates single points of failure by dividing the feeders into two duct banks to supply various substations.

Moreover, the supplies to certain of the substations currently traverse the Potomac River. Replacing these cables as currently configured would require directional boring underneath the river, which would cause constructability and extensive environmental and permitting challenges. Instead, the Downtown Resupply project will avoid the environmental challenges and reduce the linear footage of duct banks required by using higher voltage cables to connect several of the substations, resulting in additional capacity.

The Downtown Resupply Plan removes the need for river crossing, retires aging infrastructure and increases capacity to mitigate the impacts of climate change on our electric grid.

III. Downtown Resupply project schedule, current status, a budget, and any cost variances.

Updated Construction Schedule:

- L Street Substation: 2023-2025
- F Street Substation: 2025-2028
- I Street Substation: 2029-2030
- 69kV Supplies: 2023-2032
- 34kV Supplies: 2023-2025
- 13kV Supplies: 2019-2029

Current Status:

Pepco is retiring the 34 kV Transformer sources at the L Street Substation and replacing them with 69kV transformer sources. As a result of this change, some of the construction dates have changed.

Cost Estimate (provided in Formal Case No. 1144):

There are no changes to the cost estimate for the Downtown Resupply Project cost estimates as of April 15, 2022.

Items	Estimate Net (Lifecycle) ($)
13kV Distribution Cutovers "F" St to "L" St (UDLPLM7W27)	39,849,304

ITN Name:	74084: Waterfront Sub - Install 4th Transformer (UDSPLM7WF4)
	UDSPLM7WF4
FERC:	Distribution - DC
Category:	Load Driven
Sub-Category:	Capacity Expansion
2018_Actual_(000s):	$1,034.82
2019_Budget_(000s):	$1,890.00
2020_Budget_(000s):	$0.00
2021_Budget_(000s):	$0.00
2022_Budget_(000s):	$0.00
2023_Budget_(000s):	$0.00
Start:	3/1/2018
Est. ISD	12/30/2019
Finish:	9/1/2022
Scope of Work:	Install 4th Transformer at Waterfront Sub. 223 and 18 MVAr of bus capacitors.
Justification:	Current firm capacity is 144MVA, whereas projected load by Summer 2019 is 147MVA. Unanticipated load on Waterfront sub. 223 is projected to cause 2% firm capacity overload. These loads include the radial 13.8kV feeders from Buzzard Point Sta. B used to energize Waterfront and the load that would remain on Waterfront Sub. 223 due to delay in project to convert "G" St. 4kV feeders to Southwest Sub. 18 13kV.
Alternative:	None
Reimbursable:	No
Related Circuit:	-
Related Substation:	WATERFRONT (223)

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 4

QUESTION NO. 73
Referencing ITN 74120 (Pepco H-2 Page 172 of 216) White Flint New Substation 69/13kV:

a. This project is entirely outside of the District. Please explain why this project is included in this rate case in the District.

b. If Pepco asserts this project should remain in this case:

    i. All presentations, minutes, memos, and emails regarding the Project Scoping Meeting.

    ii. All presentations, minutes, memos, and emails regarding the Asset Investment review.

    iii. All presentations, minutes, memos, and emails regarding the Project Concurrence.

    iv. Provide the current ten-year-forecast for all feeders and substations affected by this proposed project.

c. Provide all transmission costs to be allocated to the District.

d. Provide all distribution costs to be allocated to the District.

e. Provide all substation costs to be allocated to the District.

f. Provide peak load served in the District from the facilities proposed by this project.

RESPONSE:

a. This project consists of sub transmission and distribution components as described in H-2 Exhibit, page 172 of 216. The cost of the sub transmission components is recoverable in this rate case using the Average and Excess Non-coincident Peak Demand (AED-NCP) allocation method, as referenced at 4-74(a). The cost of the distribution components is not recoverable in this rate case.

   Currently, the Company does not have a cost breakdown to illustrate how the project's costs are being allocated between the sub transmission and distribution components. The Company will perform this breakdown and will file it as a supplemental response to this DR.

b -f. Refer to the Company's response to 4-73(a). The Company will revisit and respond to these subparts as part of the supplemental response for this DR.

Re: Formal Case No. 1144

Dear Ms. Westbrook-Sedgwick:

Enclosed please find Potomac Electric Power Company's report regarding its efforts to develop non-wires alternatives to defer construction of the new Ward 8 substation, in accordance with Paragraph 95 of Order No. 20274 in the above-referenced proceeding.

Please feel free to contact me if you have any questions regarding this matter.

Sincerely,

/s/ *Andrea H. Harper*

Andrea H. Harper

Enclosures

cc: All Parties of Record

Order No. 20274 at Paragraph 95: NWAs for Ward 8 Substation Deferral.

Pursuant to the Order No. 20274, Paragraph 95, directive for Pepco to "provide a preliminary assessment and implementation framework for battery energy storage deployment which may enable the new Substation deferral at Ward 8 (Alabama Avenue)," in the context of "demonstration projects which would integrating more NWAs throughout the electric distribution system," Pepco submits the following report regarding its efforts to develop NWAs to defer construction of the new Ward 8 substation.

Pepco strongly supports the District's clean energy and innovation goals and the actions taken by the Commission to advance those initiatives, including its directive regarding the use of non-wires alternatives ("NWAs") to defer the need for a new substation in Ward 8 to meet capacity needs currently forecasted for the 2029 timeframe. The Commission has indicated a clear and consistent interest in the development of NWAs in a series of Orders and subsequent directives, including: 1) for Pepco to report on its plans for battery storage at the New Mt. Vernon Substation,[1] 2) approval of the distribution system planning ("DSP") and NWA process ("DSP/NWA Process") and directive to report on an accelerated schedule for implementation in Order No. 20286,[2] and 3) a directive for Pepco to report on the development of NWA projects in Order No. 20364.[3]

NWAs, including utility-scale Distributed Energy Resources ("DERs"), will play an important role in meeting the District's clean energy and grid modernization goals. The load growth driving the need for a new Ward 8 substation provides the opportunity to explore using DERs—such as solar panels, battery storage, and demand response programs—for peak load reduction. As a result, these DER deployments will enable Pepco to develop operational experience and provide broader knowledge for its District of Columbia system in the use of DERs to manage capacity constraints, improve resiliency, and understand the overall impact on the functioning of the distribution system.

The capacity need in Ward 8 will require a substantial amount of peak load shaving to allow for deferral of the new Ward 8 substation. In response, Pepco recognizes that a portfolio of projects will be needed before 2029. The 2029-need date will allow Pepco to develop this portfolio over time and through a combination of solutions established through the DSP/NWA Process and demonstration projects outside of the DSP/NWA Process, both on its own and in partnership with third parties. Included herein is a discussion of the first two demonstration projects that will be implemented to help defer the Ward 8 substation as well as a discussion of how the DSP/NWA Process will be used to add other NWA solutions to the portfolio.

The projects that Pepco is currently evaluating leverage technological advancements and steady cost declines for both lithium-ion batteries ("LIB") and smart inverters.[4] Pepco will deploy these

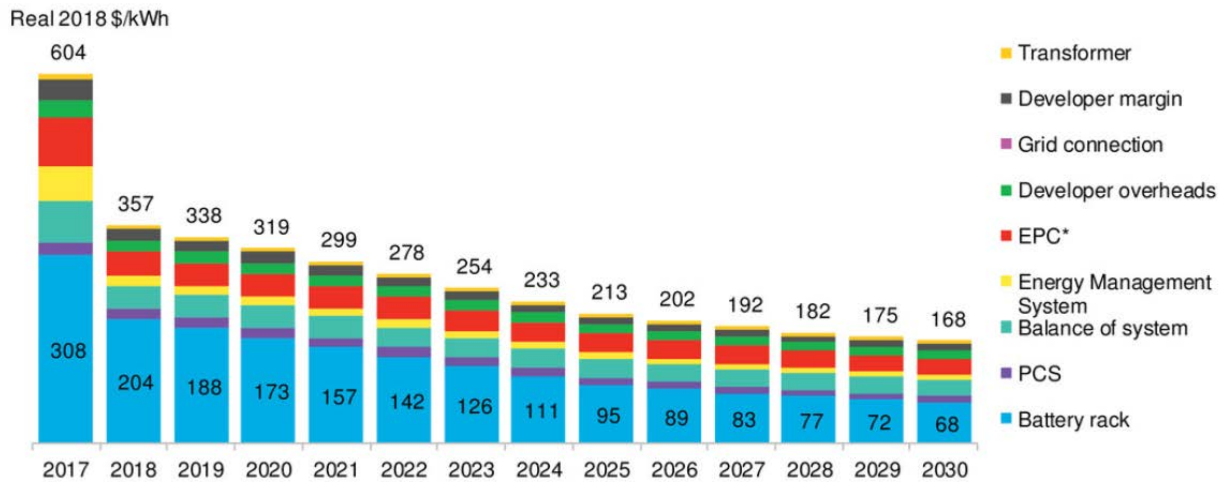
technologies in a way that meets both the District's clean energy and innovation goals and provides benefits to ratepayers.

Figure 82: Capital costs for a nameplate 20MW/80MWh AC fully-installed energy storage system



Source: BloombergNEF Note: Excludes warranty costs, which are often paid annually rather than as part of the initial capital expenditure. These costs do not explicitly include any taxes, although due to a lack of transparency in the market, some may be unknowingly included. This is for a brownfield development so excludes grid connection costs. Includes a 10% EPC margin and developer margin set at 6%. Does not include salvage costs or project augmentation. See accompanying Excel for full breakdown.

The first demonstration project that Pepco will deploy will be a utility-owned 1- ("mega watt") MW, 3-hour battery.[5] This project will be deployed on an existing Pepco property at Congress Heights, avoiding costly property acquisition. It will serve both to help defer the Ward 8 substation and defer a feeder upgrade in the area. This demonstration project will provide important learnings regarding procurement, engineering design, construction and peak load shaving and deferral capabilities. Since the demonstration project is planned to be in-service in 2022, the learnings from this project will be important in informing future demonstration projects and NWA solutions selected through the DSP/NWA Process.

The second demonstration project, referenced in Order No. 20364,[6] involves a utility-owned battery and third party-owned generation. Pepco and the District Department of Energy and Environment are currently exploring a project demonstrating a "Solar Saturation Microgrid" design, which is undergoing evaluation to provide reliable, cost-effective peak reduction on the order of 1-to-2 MW. DOEE and Urban Ingenuity first presented this demonstration in the PowerPath DC Non-Wires Alternatives Working Group. This installation could be implemented by 2024, prior to the estimated 2029 need-date for capacity expansion in Ward 8. Installing the solar saturation microgrid well before the need date allows Pepco to perform simulated loading events to gain experience with using the microgrid as a load-shaving resource during peak loading

---

5 Pepco discussed this battery project in the Capital Grid proceeding.
6 Order No. 20364 at PP 69-72.

periods. Positive results could lead to replication of the design at additional sites in Ward 8 and elsewhere in Pepco's service territory, contributing to further capacity expansion deferral and resiliency.

A Solar Saturation Microgrid enables residential neighborhoods, including single-family homes, to deploy saturation levels of rooftop solar, with participation of roughly 80% of the roofs in a given neighborhood. With the inclusion of smart inverters, centralized battery storage, enhanced communications, and a microgrid controller with dedicated software, the usual limitations on solar hosting capacity would not apply. The same battery storage assets would also enable dispatchable load reductions at hours of peak demand, alleviating stress on the local feeders and substation. The same assets could also enable microgrid islanding during broader grid outages, providing additional resiliency to a given community.

Finally, Pepco will address the capacity need requiring the Ward 8 substation through the DSP/NWA Process. As the forecasted 2029 need date is far enough out in time, Pepco will be able to address this capacity constraint through the DSP/NWA Process on an iterative basis, incrementally adding to the portfolio of NWA solutions over time to defer the forecasted Ward 8 substation-need date. Similar to the demonstration projects, the learnings from each of the DSP/NWA Process-selected solutions will inform future projects.

Continued evolution of existing regulations around contracting with third parties for DER deployment and operations and other emergent issues will require Commission action to carry out these innovative approaches. For example, an independent operator of solar and storage assets could contract with Pepco for peak demand reduction services that would be obligated at peak loading periods in Ward 8 via a long-term agreement that could be added to rate base and earn a return. Moreover, Pepco will evaluate potential NWA solutions submitted in the DSP/NWA Process through a benefits-cost analysis ("BCA") methodology.[7] Because the BCA requires a wires solution against which to compare the cost of any NWA solution, Pepco will be required to complete the design for the substation. In order to be able to properly recover for that design, Pepco will require Commission action specifically allowing for capital recovery of the design.

Pepco will continue to explore these and other avenues to expand the development of DERs and NWAs in the District and will file a follow-up to this report regarding the Company's progress deploying battery storage in Ward 8 and in implementing the NWA/DSP process.

[7] Pepco will report the details of this methodology in the September filing directed by Order No. 20364.

CERTIFICATE OF SERVICE

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 8

QUESTION NO. 5
Reference Pepco (H)-2 at page 2, “Project 62900 and 62935”.

a. Please provide all project authorization documents, workpapers and analysis conducted for the proposed Alabama Avenue Substation Battery Storage Project.

b. What other resiliency benefits does the Company intend to use the batter storage project before besides peak load reduction?

RESPONSE:

a. Please see the Company attachment FC1176 OPC DR 8-5 Confidential Attachment. Additionally, please note that this project intends to fulfill the commitment made in the Capital Grid Notice of Construction, per Order No. 20274, paragraph 94-95.

b. The Company anticipates using the battery storage project to mitigate voltage drop violations during peak load conditions and using the capabilities of the battery to augment emergency transfers in response to storms.

March 19, 2020

Ms. Brinda Westbrook-Sedgwick
Commission Secretary
Public Service Commission
of the District of Columbia
1325 G Street, N.W., Suite 800
Washington DC, 20005

Re: Formal Case No. 1144

Dear Ms. Westbrook-Sedgwick:

On August 9, 2019, the Public Service Commission of the District of Columbia issued Order No. 20203 approving Phase 1 of the Capital Grid Project. Pursuant to Order No. 20203, Pepco is filing the public portion of its 90-day compliance filing, which includes the 1) Substation diagram; 2) Compliance Media Plan; and 3) CBE Tracking Template. Portions of this filing contain Critical Infrastructure Information (CII) and are being withheld due to delivery restrictions related to COVID-19. Pepco will file the CII portions of this filing under separate cover when it can resume in-person deliveries.

Please contact me if you have any further questions.

Sincerely,

Andrea H. Harper

Andrea H. Harper

A. Order No. 20285 at Paragraph 94: Battery Storage at the Mt. Vernon Substation.

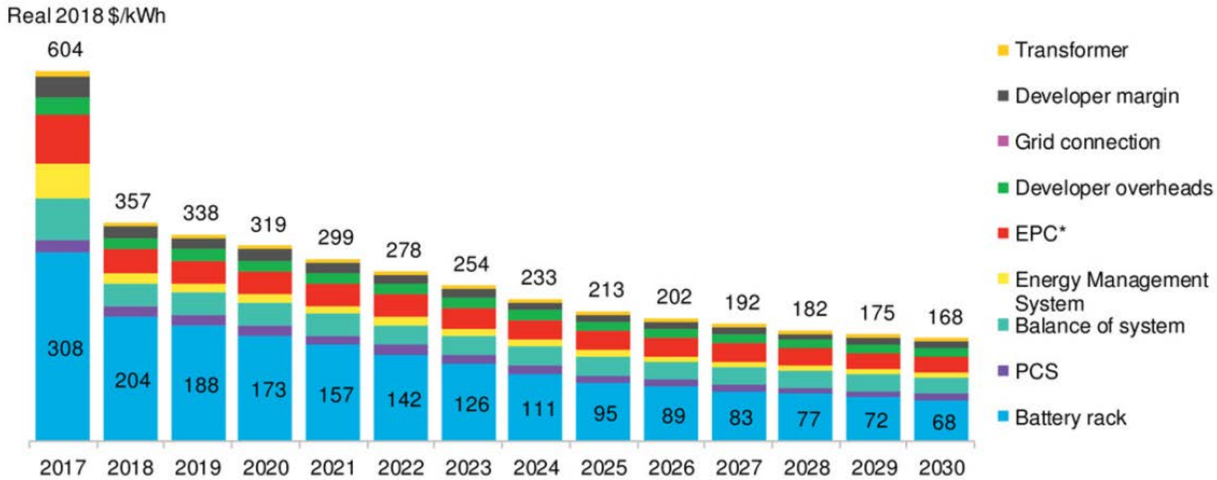
Pursuant to the Order No. 20285, Paragraph 94, directive for Pepco to file its "plan and implementation details for battery energy storage, including the physical location and expansion possibilities of the proposed battery storage at Mt. Vernon Substation," Pepco submits the following regarding its efforts to best use battery storage to defer a fourth transformer at the Mt. Vernon Substation.

Pepco fully supports and is committed to fulfilling the Commission's directive regarding battery storage to defer a fourth transformer at the Mt. Vernon Substation. Pepco agrees that exploring non-wires alternatives ("NWAs"), such as utility-scale Distributed Energy Resources ("DERs"), will be vital to meeting the District's clean energy goals. This project will give Pepco the opportunity to explore using battery storage for peak load shaving in a controlled environment, thereby developing Pepco's operational experience with using large-scale storage on its system to manage capacity constraints.

Pepco is still designing the substation and, thus, the design of the bay in which the battery will be housed as well as the design of the battery itself are not complete. Pepco's continues to evaluate battery size and design as substation design moves forward. At present, as reported Pepco's Formal Case No. 1144 Reply Comments,[1] the 600 square foot fourth transformer bay[2] is being evaluated to contain the 1 MW, three-hour battery as well as the HVAC and fire protection equipment necessary to operate a utility-scale battery inside a critical substation. This installation is currently planned for 2024. Pepco is also exploring the possibility that a larger battery may be deployed, if the installation occurs after 2024 but prior to the estimated 2027 need-date for the fourth transformer. Installing the battery prior to the need date would still allow Pepco to perform simulated loading events to gain experience with using the battery as a load-shaving resource during peak loadings. However, installing it later than the currently planned 2024 installation would allow Pepco to take advantage of technological advancements and also reduce the degradation of its capacity that will occur from repeated use of the battery prior to the need to use the battery for deferral purposes.Much like any new technology, lithium-ion battery ("LIB") technology is rapidly evolving, with the price per kWh steadily declining.[3]

[1] Reply Comments at 17.
[2] See Confidential Attachment A.
[3] Available at https://about.bnef.com/blog/energy-storage-investments-boom-battery-costs-halve-next-decade/

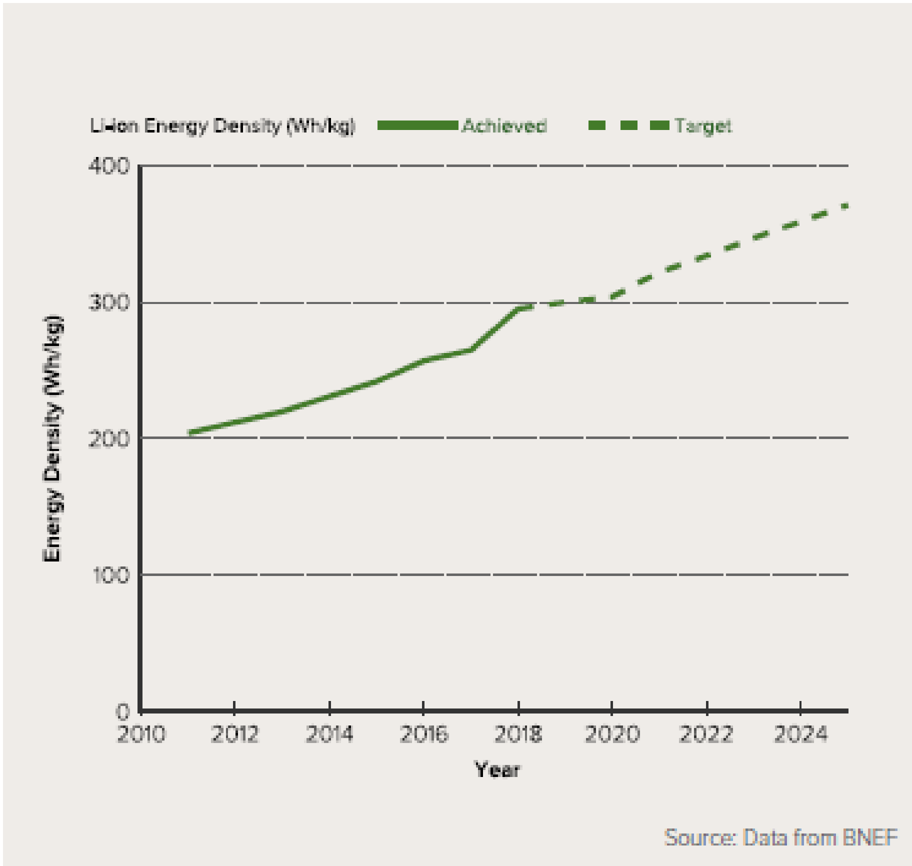
Figure 82: Capital costs for a nameplate 20MW/80MWh AC fully-installed energy storage system



Source: BloombergNEF Note: Excludes warranty costs, which are often paid annually rather than as part of the initial capital expenditure. These costs do not explicitly include any taxes, although due to a lack of transparency in the market, some may be unknowingly included. This is for a brownfield development so excludes grid connection costs. Includes a 10% EPC margin and developer margin set at 6%. Does not include salvage costs or project augmentation. See accompanying Excel for full breakdown.

Further, as illustrated in the figure below, LIB energy density - the amount of electricity that can be stored in the same size battery - is projected to steadily increase and is likely to continue to improve as research and design of electric vehicles continues.[4]

[4] Available at https://rmi.org/insight/breakthrough-batteries/



Because of these factors, as well as the expected degradation of the battery caused by repeated discharge, Pepco is currently performing a feasibility study that will inform its decision about the timing of installation of the battery and its independent HVAC and fire protection. Pepco's ultimate goal is to defer the need for the fourth transformer as long as practicable, and Pepo will assess the options with that goal in mind and report back to the Commission.

Pepco also has the ability to expand the battery storage project to an area outside of the planned structure of the new Mt. Vernon Substation. Specifically, the immediate area adjacent to the Mt. Vernon Substation will be used during construction as a staging area and could be used for battery storage after construction. However, post-construction, any use of this space to house expanded battery storage would require approval from the Board of Zoning Adjustment ("BZA"). Pepco will continue to explore this and other avenues to expand the implementation of DERs and NWAs in the District.

B. Order No. 20274 Attachment A: Magnetic Field Mitigation

The Commission directed "Pepco to provide calculations of magnetic field strength based on final substation designs" for the Mt. Vernon Substation. The Commission further "to provide any site-specific mitigation plans for reducing the magnetic fields from underground transmission XLPE (solid dielectric) cables." Finally, Pepco is directed "to provide the study results of their evaluation on the expected levels of magnetic fields associated with the proposed Capital Grid project as described in June 29, 2018 Notice of Construction, Appendix M Environmental Impact Study."

1. Calculations of Magnetic Field Strength Based on Final Mt. Vernon Substation Final Design

Calculations of the magnetic field strength associated with the Mt. Vernon Substation will be prepared within three months of the completion of the Mt. Vernon Substation Final Design, which is currently scheduled for September 4, 2020. Pepco will provide the magnetic field strength estimates after that date.

2. Mitigation Plans for Reducing the Magnetic Fields from Underground Transmission XLPE (Solid Dielectric) Cables

Regarding the mitigation of magnetic field resulting from underground transmission solid dielectric cables, these lines connecting to substations are very weak sources of magnetic fields above ground. The electric field is totally blocked by the coverings of the underground transmission lines and the earth itself. Although the magnetic field from underground lines is not similarly blocked by the ground cover, the placement of the conductors close together in conduits results in a significant reduction in the magnetic field and causes the magnetic field to diminish more quickly with distance so that even a few feet away from the lines field levels often fall to background levels. For these reasons, the opportunity for the underground lines to contribute to residential EMF is non-existent (electric fields) or vanishingly small (magnetic fields).

C. Order No. 20274 Attachment A: Communication Plan

The Commission directed that any Customer Outreach and Engagement Plan should include, at a minimum:

1. A detailed description and timetable of notice(s) to affected consumers of impending construction;

2. A plan of customer communications, such as bill inserts, newspaper ads, website postings;

3. An interactive dedicated website or project map related to the project which residents can access for project information;

4. A community liaison who consumers can contact with issues or complaints related to the project and who will be responsible for coordinating community outreach;

5. A hotline that consumers can contact to log complaints, which shall be responded to with 24 hours of receipt; and

6. A method of tracking consumer complaints related to the project, and periodic reporting and discussion of such complaints and their resolution to the Commission and the Office of the Peoples Counsel.

Please see Attachment B for the Communications Plan as updated for Order No. 20274.

D. Order No. 20274 Attachment A: Economic Opportunities

The Commission directed Pepco "to develop a plan with percentage goals and timelines associated with CBE contracting and hiring of local residents for the Capital Grid Project Construction."

In the Sept. 8, 2019 90-Day Compliance Filing to Order No. 20203, Pepco stated:

> Pepco will be hiring a compliance contractor to track resident hiring for the Capital Grid Project. The compliance contractor will be responsible for gathering, tracking and working with internal teams and the contractors to validate FTE reporting data inputs from contractor time and headcount reports. This data will be captured in Pepco's internal sourcing system that will also be used to collect CBE contractor data in an effort to streamline the process. Data will be then be compiled to produce the quarterly and annual CBE and local hiring reports that will be submitted to the Commission. Pepco historically has not tracked local contractor hiring and is still in the process of setting up its program and defining appropriate goals for its contractors. Pepco is in the process of contacting its contractors regarding their current and expected levels of District hiring and will use that data to help inform appropriate percentage goals.
>
> Once appropriate goals are set based on discussions with its contractors, Pepco will create a template for tracking and both the goals and the template will be shared with the Commission.

Pepco has completed the template (see Attachment C). Further, Pepco has implemented a secure data portal for intake of supplier hiring data. The first test of this data intake was performed from February 3 to February 24, 2020 for the January reporting period. The second test was performed March 2 to March 13, 2020 for the February reporting period. A total of 19 Capital Grid Project suppliers were queried. The range of responses were as follows:

Performance Period	January 2020	February 2020
Open to vendors to enter information in to SMART GEP	February 3-24	March 2-13
Total # of suppliers	19	11
Suppliers Responded	11	7
Suppliers with Questions	8	1
Suppliers failed to respond	8	4
% of DC residents on project	Data not available	12%
Total # of employee's vs DC residents	Data not available	8/1

To clarify the reporting requirement and improve the response rate, Pepco will add residency tracking into supplier Key Performance Indicator discussions, continue to highlight an opening screen message explaining the steps to reporting and results of non-compliance, and hold a conference call with the Capital Grid Project suppliers on the residency tracking requirement.

As a further follow-up, Pepco conducted a survey of Capital Grid suppliers asking what percentage of their total contingent they would agree is a reasonable initial goal regarding District resident hiring for the Capital Grid Project. The survey results indicate suppliers believe an initial goal of 25% of their workforce executing the Capital Grid work being District residents was attainable. Based on this data Pepco intends to use 25% as the starting point for its supplier District resident hiring and expects to be able to increase that amount incrementally on an annual basis, based on market conditions, through its contract award system.

The results of this reporting will be included in Pepco's Diverse Supplier Reports.

E. Order No. 20274 Attachment A: Construction Reporting to the Commission

The Commission directed Pepco to "provide an updated construction timeline for the major components of the Capital Grid Project." Pepco submits the following update to the construction timeline. Pepco notes that Gantt Charts will also be provided starting on April 15 as part of the quarterly Capital Grid Project reporting requirements.

Submission	Mt. Vernon Substation
30% - Civil	6/6/2018
60% - Civil	10/19/2018
90% - Civil	6/30/2020
IFC – Civil	9/4/2020
30% -Electrical/Layout/Str	6/6/2018
60% - Electrical/Layout/Str	10/20/2018
90% - Electrical/Layout/Str	6/4/2020
IFC - Electrical/Layout/Str	9/4/2020
30% - P&C	6/5/2018
60% - P&C Complete	8/17/2020
90% - P&C Complete	2/24/2021
IFC - P&C	4/9/2021

F. Order No. 20274 at Attachment A: Permits.

The Commission directed Pepco to provide it with the following when available:

a. Copies of all permits and/or instruments approving or authorizing work activities prior to the commencement of activities within 30 days of obtaining each permit or authorization;

b. Two calendar days' notice prior to conducting any work in areas identified as potentially contaminated; and

c. A report on all safety and environmental violations to human health and/or the environment within twenty-four (24) hours of receipt of a citation by any relevant governmental agency.

There has been no change to the permit matrix since Pepco's Nov. 7, 2019 Order No. 20203 90-Day Compliance filing in this docket.

MOUNT VERNON SUBSTATION MITIGATION PLAN

tb&a

pepco
An Exelon Company

DRAFT March 2020

INTRODUCTION

The Capital Grid project is a forward-looking plan that promotes enhanced reliability and will strengthen the District's energy grid. Along with a 10-mile transmission line, the project includes upgrading three substations in the District and Maryland and building a new substation to serve the Mt. Vernon community and its projected rapid growth and development.

The Mount Vernon Substation will be constructed at 1st and K Street NW in an area where there are currently more than 18,000 residential units and over 10 million square feet of completed and/or planned retail and office space. This continuous growth in Mount Vernon Triangle, Northwest One, Shaw, NoMa, and surrounding areas will overload the current system without the addition of a new substation to meet this area's growing demands.

The Mount Vernon Substation will be enclosed and housed in a building that fits the aesthetics of the surrounding area. While the substation will provide long-term benefits to customers, it involves substantial work and construction will have various impacts on the surrounding area. Until construction begins, we will use this property as a staging area. We expect to start construction in 2020 and to complete it by 2023. It is important to mitigate the concerns that are directly associated with the impacted stakeholders.

This Mount Vernon Substation Mitigation Summary serves as a tool to minimize the construction impacts as much as possible through an effective mitigation process that is built around proactive communication, education, transparency, responsiveness and collaboration.

APPROACH

Staying in front of the information curve, maintaining consistent communication with stakeholders surrounding the Mount Vernon Substation will be critical to the success of the project. We will continue to engage the identified stakeholders including:

- Meeting with stakeholders prior to the start of construction
- Keeping stakeholders regularly apprised of construction activity including anticipated impacts throughout the life of the project
- Notify stakeholders of any community meetings and encourage their attendance
- Promote project and safety awareness
- Build advocacy and trust by being a reliable, consistent and accessible source of information
- Track and respond to constituents' issues and concerns and collaborate with the contractor and/or appropriate agencies to assist with responses

IDENTIFICATION OF STAKEHOLDER GROUPS

We have identified the stakeholder groups that will be directly impacted by the construction of the Mt. Vernon Substation. Proactive communication with all stakeholder groups is critical to the success of the project. The delivery of clear consistent messaging to educate stakeholders on the purpose and need for the project, along with construction impacts will be used to ensure all stakeholder groups are informed and proactively updated on all activity.

CAPITALGRID
BUILDING TOMORROW'S ENERGY GRID TODAY

CAPITAL GRID PROJECT BENEFITS

The Capital Grid project provides many long-term benefits to our customers across the Capital region.

Enhanced Service
- New infrastructure that will reduce the strain on surrounding areas, improving service for customers

Stronger System
- Enhancements that will lessen the impact and speed recovery from storms and other emergencies

Added Capacity
- A more robust energy grid to handle energy needs, as the District experiences rapid residential and commercial development

Economic Support
- Increased opportunities for minority, women, veteran and disabled local businesses and contractors to support project work as we energize the diverse, local communities where we live and work

STAKEHOLDER GROUPS

- Residents
- Health Care Centers
- Schools/Libraries/ Recreation Centers
- Businesses
- Churches
- Multi-Modal Users
- Developers
- Government Agencies and Utilities
- City Officials
- Emergency Responders

CONSTRUCTION CONCERNS AND TASKS

We have identified the common stakeholder concerns. The following outlines the concerns and the tasks assigned to mitigate these concerns. The catchment area that would be most directly impacted by the Mount Vernon Substation construction falls within and in close proximity to the surrounding streets.

	PROPERTY ADDRESS

ADDITIONAL HIGHLIGHTS	**CONCERNS**
K St. Farm - 111 K St. NW, Washington, DC 20001 **Farm at Walker Jones** - 111 K St. NW	• Sidewalk/Road Closures • Traffic • Accessibility

CONCERNS	TASKS
Vibration	• Conduct pre-construction video surveys • Continue to monitor and communicate with stakeholders experiencing concerns • Identify causes of vibration and coordinate solutions with contractor • Determine if vibration monitoring device is necessary
Trash/Specialized Services	• Survey construction area to identify pre-existing pick-up locations • Work with DPW and any private companies to create alternate pick-up locations during construction • Special consideration for private and bulk trash • Inform community of any changes and encourage container labeling • Monitor ongoing trash pick ups
Parking	• Survey and document parking challenges along route, identifying street cleaning hours/days. • Align Survey with MOT • Schedule routine field observations for quality controls • Coordinate with DDOT to temporarily adjust parking restrictions when needed based on MOT • Work with Capital Grid project team to provide off site parking options and/or shuttle service if needed
Special Accommodations	• Identify metro access users and other private transportation services by researching and contacting appropriate contacts to relocate pick-up and drop off locations. • Identify if there are any ADA parking restrictions and potential relocation options during construction. • Identify handicapped parking spots within the catchment area • Consider ADA access to apartment buildings and provide alternate access during construction
Parking and Driveway Access	• Survey and document parking challenges along route, identifying street cleaning hours/days. • Align Survey with MOT • Schedule routine field observations for quality controls • Coordinate with DDOT to temporarily adjust parking restrictions when needed based on MOT • Work with Capital Grid project team to provide off site parking options and/or shuttle service if needed
Accessibility	• Do field surveys of access points (especially for health centers) and coordinate with construction team to ensure they are never blocked
Environmental (Dust)	• Create dust and debris containment solutions that may include: Covering bare soil, keeping roads damp, applying dust retarding products, restricting earthmoving tasks during extremely windy conditions • Monitor the impacts during field visits

CONCERNS	TASKS
Noise	• Identify source of noise concern • Attempt to employ noise quieting methods such as: Haul roads, detours, temporary barriers and strategic storage areas to shield • Ensure Stakeholders are aware of construction hours • Field visits to monitor noise levels
Deliveries	• Identify potentially impacted stakeholders to document delivery schedules and coordinate relocation during construction or alternatives to ensure deliveries are made • Notify major delivery companies of construction (UPS, USPS, Amazon, FedEx, DHL) • If needed, work with DDOT to establish temporary delivery zones
Sidewalk/Road Closures	• Proactively notify the community of lane and sidewalk closures • Provide clear and strategically placed signage • Provide timeline for closures • Review and understand MOT and coordinate with DDOT on detours • Communicate with WMATA and transportation services to relocate bus stops if needed • Provide secure and safe options for ingress and egress
Traffic	• Keep interactive map updated • Work with DDOT on detours and traffic advisories • Deploy traffic control officers/flaggers if needed
Pedestrian Safety	• Provide signage and barriers to direct pedestrians safely around the work zone as required in the MOT • Work with the contractor to minimize uneven pathways during construction • Provide safe access to residences and establishments • Use traffic control officers to direct pedestrians, if needed. • Document traffic calming measures to ensure replacement once construction completed

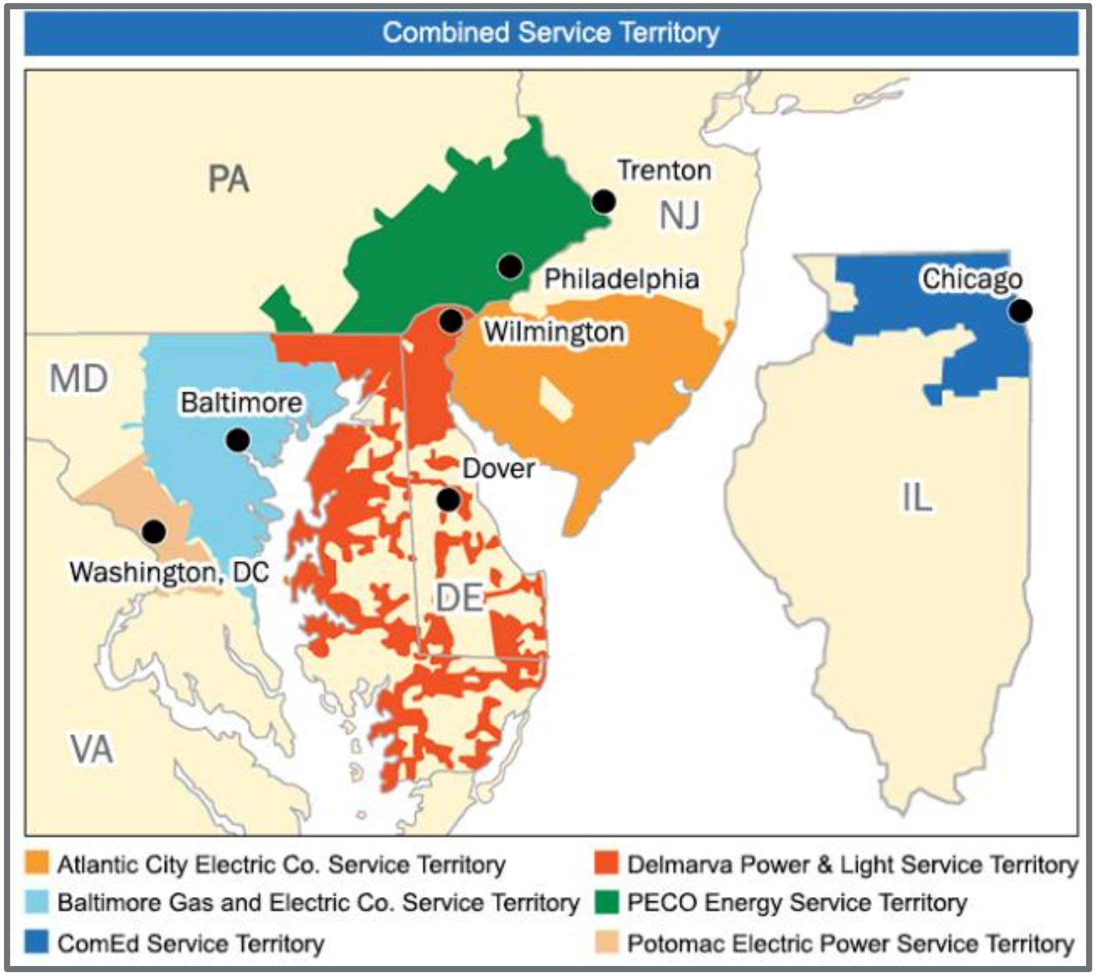
About Exelon

- Fortune 100
- 33,400 Employees
- 10M Electric and Natural Gas Utility Customers
- Utility Operations in 6 states
- 6 Utilities
  - Atlantic City Electric
  - BGE
  - ComEd
  - Delmarva Power
  - PECO
  - Pepco



Battery Energy Storage System Benefits

State Policy Goals

- Environmental Objectives
- Electric Vehicle support
- Green House Gas Reductions
- Economic Development
- Land Use

Utility Goals

- Deferral Opportunities
- Hosting Capacity
- Operational Flexibility
- Resiliency
- Reliability
- Service Quality (Voltage/Harmonics)
- Electrification
- Learnings
- PJM Market Participation

Customers Goals

- Resiliency
- Reliability
- Cost Savings
- Market Research
- Innovation
- DER Integration

Legislation and Policy

- Senate Bill 573/House Bill 650 was signed into Law May 13, 2019 and the Commission Order was released on June 1, 2019
- All MD Investor-Owned Utilities ("IOU") required to submit 2 pilots.
- One of the two projects for each utility must be third-party owned.
- Total aggregated program size is 5-10 MW with a minimum of 15 MWh
- Reporting to the Commission annually until 2025.

Models	BTM[1] / FTM[2]	Owner	Grid Reliability Control	Wholesale or Other Application Control
1. Utility Only	FTM	Utility	Utility	Utility
2. Utility and 3rd Party Operation	FTM	Utility	Utility	3rd Party
3. 3rd Party Ownership	Either	3rd Party	Utility contract with 3rd Party	3rd Party
4. Virtual Power Plant (VPP)	BTM	Customer or 3rd Party	Utility or contract with 3rd Party Aggregator	3rd Party, Customer(s) or Utility Aggregation

[1] "BTM" or behind the meter indicates that the storage system is placed behind the customer's revenue style meter

[2] "FTM" or front of the meter indicates that the storage system is in front of the customer's meter or that there is no revenue style meter on site

Maryland Exelon Utility Projects

Project Summary

	Delmarva Power		PEPCO		BGE

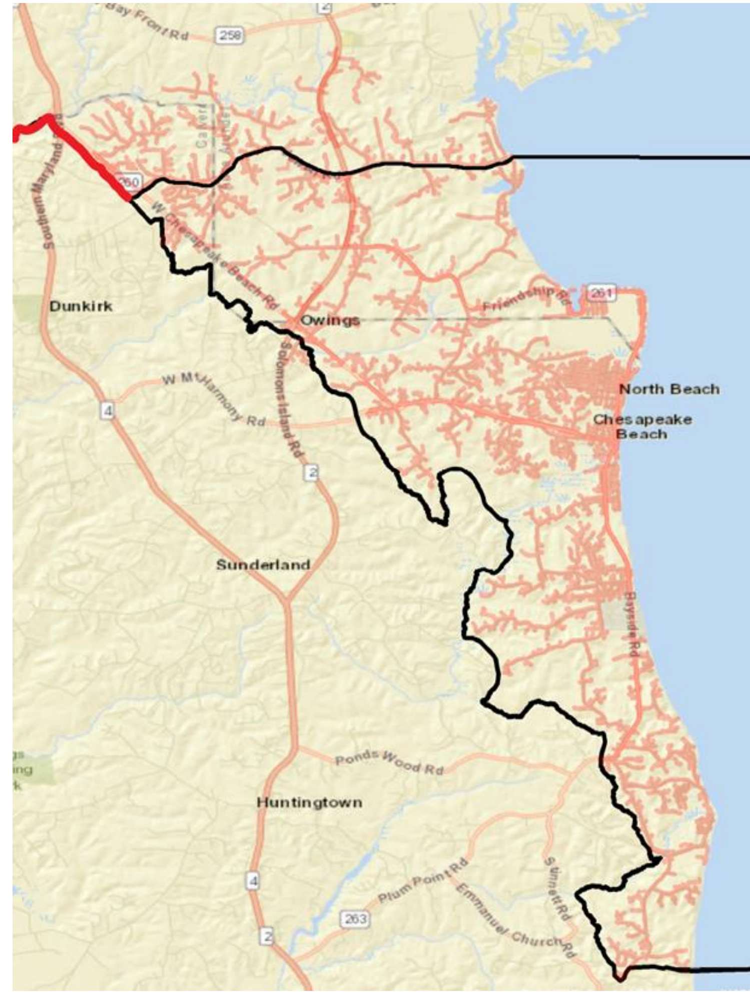
Model 3: Third Party Owned and Third Party Operated				X	X		2
Model 4: Virtual Power Plant	X						1

Pepco Holdings
An Exelon Company

BGE Identified Area of Need

- BGE reviewed all identified overloads system-wide and compared the costs of a BESS install vs. a traditional project
- Marriott Hill 34 kV post-contingency winter overload showed best opportunity for avoidance of traditional distribution system investment (10 miles of undergrounding)
- Area serves more than 9,000 customers via three substations and ten 13 kV feeders
- Provides opportunity for BGE to leverage two systems working in tandem:
  - Unique learning opportunity
  - Backup benefits from having multiple storage units (e.g., minimize maintenance down time, enhance storm resiliency)
- No utility real property acquisition required; adequate space for third-party project siting



BGE BESS at Fairhaven Project

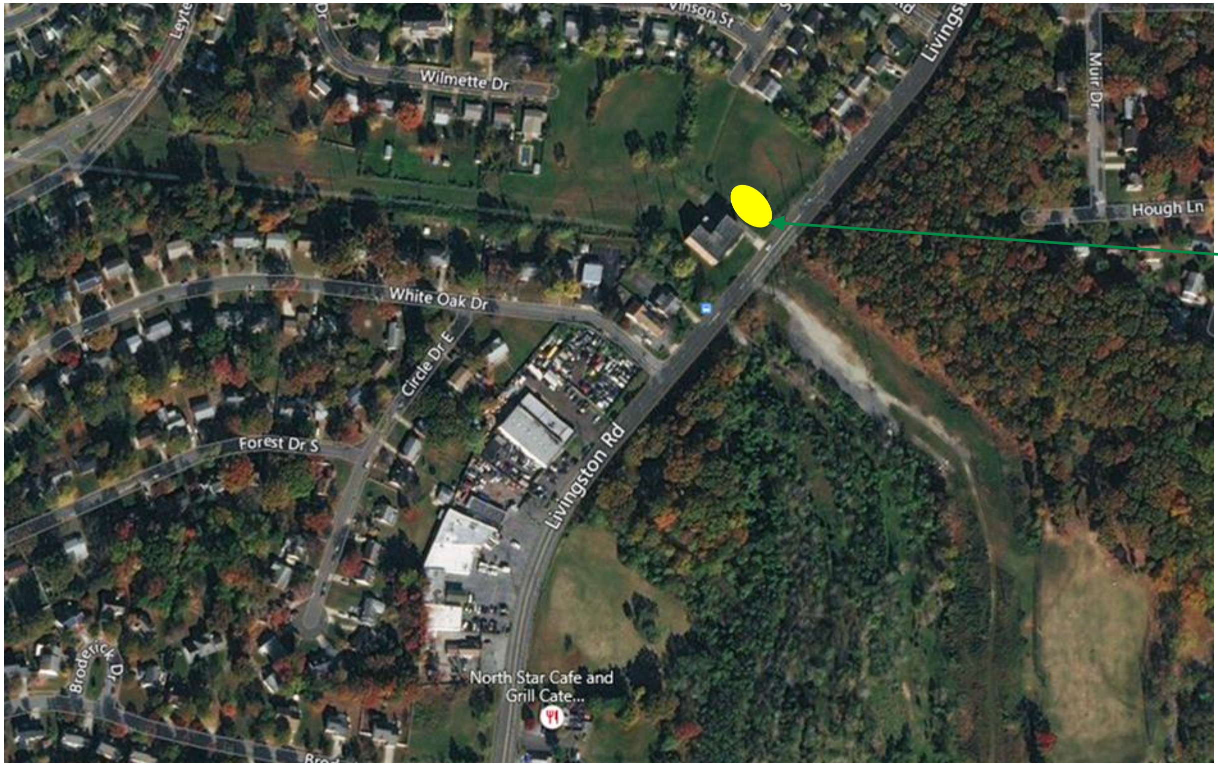
Category	Project Information
Required Capacity for Grid Reliability through the 10-year project term	2.5 MW/4.0 MWh
Initial Usable Capacity	2.5 MW/7.1 MWh
Business Model	Model 1: Utility Only; BGE operates for grid reliability and in PJM markets, Front-of-the-Meter (FTM)
Project Developer	ABB/Hitachi is the proposed developer
Energy Storage Technology	Lithium-Ion BESS
Primary Application	Grid reliability/distribution infrastructure avoidance
Primary Operation	BESS will provide discharge capacity during winter peak load conditions; BGE will communicate a kW interval signal to the BESS Control system
Secondary Application	PJM Wholesale Market Services (Frequency Regulation)
Primary Location	Fairhaven Substation in Southern Anne Arundel County

BGE Chesapeake Beach Project

Category	Project Information
Required Capacity for Grid Reliability through the 10-year project term	1.0 MW/1.5 MWh
Initial Usable Capacity	1.0 MW/2.0 MWh
Business Model	Model 3: Third-Party Ownership that is Front-of-the-Meter (FTM)
Project Developer	Ameresco is the proposed developer/owner/operator
Energy Storage Technology	Lithium-Ion BESS
Primary Application	Grid reliability/distribution infrastructure avoidance
Primary Operation	BESS will provide discharge capacity during winter peak load conditions; BGE will communicate a kW interval signal to the BESS Control system up to 10 times in a year
Secondary Application	PJM Wholesale Market Services
Primary Location(s)	Multiple locations identified in Northern Calvert County

Exelon

National Harbor Project Utility Owned/Third Party Operated Model



Battery Energy Storage

National Harbor Project: Located in Oxon Hill, Maryland

- Defer construction of a planned Pepco substation
- Peak shaving and grid emergencies
- PJM market participation opportunity – utility/third party revenue sharing
- Expected future expansion of battery storage at site – either utility owned or third party owned

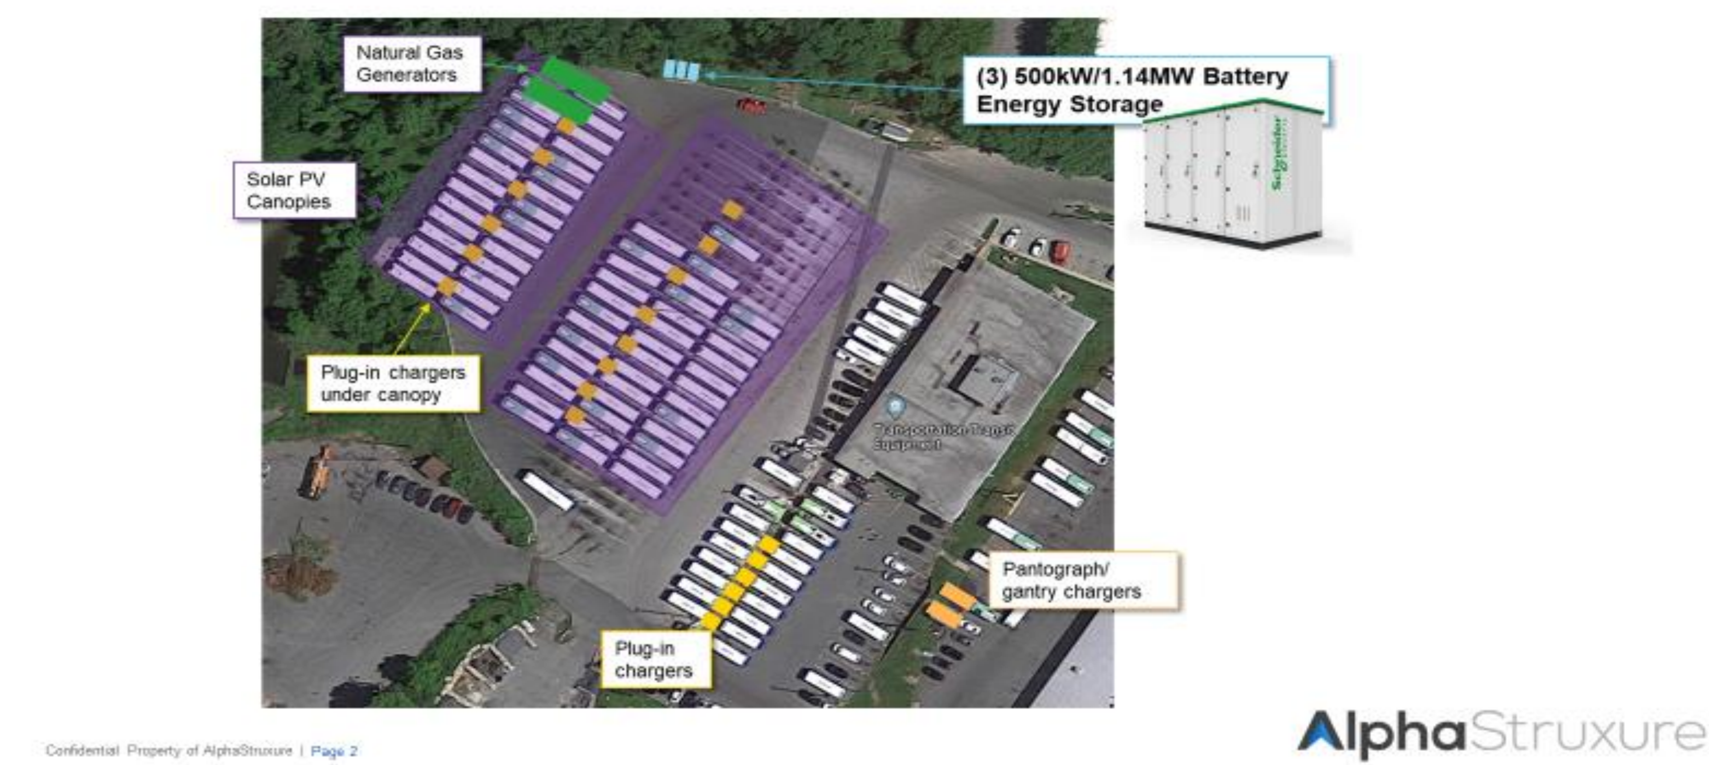
National Harbor Project Summary

Project Category	Project Information
Size	1.0 MW/3.0 MWh
Business Model	Utility Owned/Third Party Operated
Energy Storage Owner	Pepco
Energy Storage - Wholesale Operations	A.F. Mensah (Minority Owned African American Firm)
Project Developer	A.F. Mensah (Minority Owned African American Firm)
Energy Storage Technology	Lithium Iron Phosphate (LFP)
Primary Application	Peak Shaving, Grid Reliability
Secondary Application	PJM Market
Location	Livingston Road, Oxon Hill, MD

Exelon

Bus Depot Project -- Third Party Owned/Third Party Operated

Draft Site Overview



Montgomery County Electric Transit Bus Depot: Silver Spring, Maryland

- Avoid construction of new Pepco distribution feeder
- Support regional grid reliability
- Support electric transit bus charging during normal grid conditions and grid outages
- Rely primarily on energy from planned photovoltaic array to charge battery

Exelon

Electric Bus Depot Project Summary

Project Category	Project Information
Size	1.0 MW/3.0 MWh
Business Model	Third Party Owned/Third Party Operated
Energy Storage Owner/Operator	AlphaStruxure
Project Developer	AlphaStruxure
Energy Storage Technology	Nickle Metal Chloride Lithium-Ion
Primary Application	Peak Shaving, Grid Reliability
Secondary Application	Customer side demand management. Charging during outages. Microgrid integration with photovoltaic array
Location	Brookville Road, Silver Spring, MD (Montgomery County)

Ocean City Project -- Utility Owned/Utility Operated Model

Ocean City Project: Beach-front Resort Community on a Barrier Island in the Atlantic Ocean

- Reliability improvement support for Automatic Sectionalizing and Restoration (ASR) Scheme
- Resiliency improvement by providing back-up support for adjacent county library and regional electricity grid (increasing storm risk resulting from climate change)
- PJM market participation opportunity
- Selected vendor: Mesa Veterans Power (Service-Disabled Veteran-Owned Firm)

Ocean City Project Summary

Project Category	Project Information
Size	1.0 MW/3.0 MWh
Business Model	Utility Owned/Utility Operated
Energy Storage Owner/Operator	Delmarva Power
Project Developer	MESA Veterans Power (Service-Disabled Veteran-Owned Firm)
Energy Storage Technology	Nickle Manganese Cobalt Lithium Ion
Primary Application	Peak Shaving, Grid Reliability, Resiliency
Secondary Application	PJM Wholesale Market
Location	Ocean City, MD (Worcester County)

Elk Neck Project -- Virtual Power Plant Business Model

Elk Neck Project: Residential community located in Cecil County on an isolated peninsula in the Chesapeake Bay

- First Exelon Utility Virtual Power Plant and first PJM Market Virtual Power Plant

Reliability/Resiliency Opportunity:

- 300 + residential customers south of Elk Neck State Park fed by a four-mile radial feeder
- Unique Virtual Power Plant Project
- Experienced vendor selection – Sunverge Energy, Inc.

Exelon

Elk Neck Project Summary

Project Category	Project Information
Size	0.5 MW/1.5 MWh
Business Model	Virtual Power Plant (VPP) - Aggregated Residential Storage Program
No of Customers in the VPP Program	110 Residential Customers
Energy Storage Developer/Owner	Sunverge Energy, Inc
Energy Storage - Wholesale Operations	PJM Virtual Power Plant Pilot
Energy Storage Technology	LG Electronics 5kW/19.6 kWh
Primary Application	Grid Reliability & Backup Power
Secondary Application	DER-Integration/Possible PJM Market Participation
Location	Elk Neck Peninsula, Cecil County, Maryland

Next Steps

1. Execute contracts with vendors
2. Respond to Commission requirements for emissions modeling, decommissioning and safety
3. Continue to take steps to participate in the PJM market
4. Complete integration plan for utility operation of batteries for grid support
5. Continue to investigate other opportunities for storage

Projects associated with the modified Downtown Resupply Plan which should not be included in the Multi-Year Rate Plan.

Washington DC, 20005

Re: Formal Case No. 1144

Dear Ms. Westbrook-Sedgwick:

On August 9, 2019, the Public Service Commission of the District of Columbia issued Order No. 20203 approving Phase 1 of the Capital Grid Project. In its order, at Paragraph 46, the Commission directed Pepco "to provide a draft format for the Annual Report for review and approval by the Commission within 180 days of the date of the Order." Pursuant to Order No. 20203, Pepco is filing its 180-day compliance filing, which includes its proposed draft format for the Annual Report.

Please contact me if you have any further questions.

Sincerely,

Andrea H. Harper

FC 1144
Capital Grid - Downtown Resupply Project
Annual Report

Attachment [X] to Annual Consolidated Report

Downtown Resupply Description (updated, if appropriate):

The Downtown Resupply project will replace aging 34 kV and 69 kV supply feeders to the L Street, F Street, Georgetown, and 22nd Street Substations. This work along with upgrades to the F Street Substation and extension of new 13 kV feeders will accommodate load transfers from I Street Substation as well as increasing sub-transmission supply capacity and providing reliability benefits to the District of Columbia.

Explanation of Significant changes to Project:

[ ]

Cost Estimate (provided in Formal Case No. 1144):

Items	Estimate Net (Lifecycle) ($)
Downtown Resupply	494,028,210
13kV Distribution Cutovers "F" St to "L" St (UDLPLM7W27)	39,849,304
13kV Distribution Cutovers from "I" St to "F" St & "L" St (UDLPLM7W28)	32,434,952
Champlain to L Street 34kV (UDLPRM4WA8)	102,319,736
F St Sub Rebuild (69kV) (UDSPLM718A)	50,372,188
F St Sub Rebuild (UDSPLM717A)	33,581,458
L St Sub Capacity Expansion Work (UDSPLM722A)	4,011,558
Repl 69kV Self-Containd UG Supl-Georgetown,"F" St, 22nd St Subs (UDLPRM5SG)	177,223,136
Retire "I" St Sub (UDSPRD27RD)	2,081,496
Retirements for Downtown Resupply 34kV and 69kV for DC (UDLPRM4RDR)	35,522,470
Retirements for Downtown Resupply 34kV and 69kV for MD (UDLPRM4DRM)	1,309,199
Retirements for Downtown Resupply 34kV and 69kV for VA (UDLPRM4DRV)	13,322,712
Telecom - 22nd Street Sub (UDFPO22SS)	500,000
Telecom - Fiber for 34-69kV Resupply Champlain, L Street, F Street (UDFPOCL01)	500,000

Telecom - Georgetown Sub (UDFPOGS01)	500,000
Telecom - L Street Sub (UDFPOLS01)	500,000

Current Cost Estimate (As of xx/xx/2020):

[ ]

Construction Schedule (provided in Formal Case No. 1144):

L Street Substation: 2020-2021
F Street Substation: 2022-2026
I Street Substation: 2026-2028
69kV Supplies: 2019-2028
34kV Supplies: 2019-2028
13kV Supplies: 2019-2027

Updated Construction Schedule (as of xx/xx/2020):

Washington, DC ("Synapse Study"), filed with the Public Service Commission of the District of Columbia ("Commission") on January 29, 2018 ("DOEE Comments").

I. BACKGROUND

On May 10, 2017, Pepco filed with the Public Service Commission of the District of Columbia ("Commission") a Notice of Construction for construction of two 230 kV underground circuits from the Takoma Substation in Takoma Park, Maryland to the rebuilt Harvard Substation and from the rebuilt Harvard Substation to the rebuilt Champlain Substation as well as upgrading aging substation infrastructure ("NOC-1"). Pursuant to its authority under Chapter 21 of the District of Columbia Municipal Regulations, the Commission issued a Notice *sua sponte* opening an investigation into the reasonableness, safety, and need for the underground transmission lines and the substations in NOC-1 on May 24, 2017, noting that "Pepco has provided, with its NOC, the information the Commission requires when initiating an investigation pursuant to Chapter 21 of Title 15 of the D.C. Municipal Regulations."[3] The Commission set comments and reply comments on NOC-1 for 90 and 120 days, respectively, after the Notice was published in the D.C. Register.[4] On September 7, 2017, the Commission issued Order No. 19085 *sua sponte* extending the comment period to November 29, 2017 and the reply comment period to January 2, 2018.[5] Various participants filed comments on NOC-1. On

January 2, 2018, the Commission *sua sponte* extended the date for reply comments to February 1, 2018,[6] and Pepco responded to the comments on February 1, 2018.

On January 29, 2018, DOEE filed in Formal Case No. 1130 comments that included the Synapse Study. On February 14, 2018, the Commission issued Order No. 19274 which, *inter alia*, directed Pepco to respond to the Synapse Study in Formal Case No. 1144.[7] Pepco responds to the Synapse Study and the DOEE Comments herein.

I. Executive Summary

It is a dynamic time in the District of Columbia and in the energy industry. A transformation toward a clean energy future throughout the country is underway, and the District of Columbia is a leader in bringing about this change. Pepco is making the necessary investments to enable this and deliver on our promise to provide safe, reliable, affordable and sustainable energy to all customers.

Over the past several years, Pepco has invested in modernizing the electric grid in the District of Columbia, using innovative technologies that have resulted in top-decile reliability for customers. At the same time, these investments are making the grid smarter, more dynamic and better able to integrate distributed energy resources ("DER"), such as rooftop solar, electric vehicles ("EV"), energy storage as well as facilitating demand response ("DR") and greater energy efficiency ("EE").

Pepco has the privilege to serve the District of Columbia and its residents and businesses, which have been so progressive and forward thinking when it comes to advancing and adopting energy innovation and combatting climate change. Pepco takes its role in facilitating and

[7] Order No. 19274 at P 18, Attachment A.

enabling this new, clean energy future seriously—a future that is more decarbonized, more distributed, more digitized and more connected. At the same time, Pepco understands the awesome responsibility it has serving the District of Columbia. It is important that Pepco invest to harden the grid to make it more resilient in the face of climate change and evolving threats, both physical and cyber-related. Pepco has made, and is proposing to make, these investments in system hardening and redundancy so that when extreme events occur, such as the storms of this past winter, it does not take a serious toll on the District of Columbia.

As Pepco engages in grid planning, it continuously asks a series of questions related to what the implication of all these new innovations and technologies are for the electric grid and for customers. What investment is needed to seamlessly connect and integrate these innovative technologies to the grid? What investment is needed to ensure high-levels of reliability for all customers in the face of incredible load growth in various pockets throughout the District of Columbia? What are the types of redundancies that are needed to maintain the integrity of the system in the face of extreme events? What investment is needed to facilitate further de-carbonization of the electric system? And, how can Pepco best balance these investment needs with the need to maintain overall system affordability?

This type of planning process led Pepco to determine that the Capital Grid Project is a critical part of ongoing efforts to improve and modernize the electric grid. It will deliver value to customers by increasing resiliency and reliability, allowing for greater interconnection of DER and creating the foundation for a clean energy future. The Capital Grid Project, for which Pepco is seeking approval, is a long-term plan that efficiently addresses multiple system needs: aging infrastructure, load growth, networking the transmission system for redundancy, enabling the deployment and integration of zero-carbon technologies and providing for the growing penetration of DER. The project, which will run from February 2019 through June 2026, involves rebuilding two existing substations (Harvard and Champlain Substations), constructing approximately 10 miles of underground transmission lines and constructing a new substation (Mt. Vernon Substation) in the District of Columbia. At the same time, Pepco is seeking authorization to pull the cable through the conduit authorized for installation in Order No. 18254 to allow it to convert the Waterfront Substation to a 230 kV substation.

Throughout the planning of the Capital Grid Project, Pepco was very cognizant of the cost of the investment and intent on ensuring that customers will receive the value they deserve. It is important to keep affordability front and center. Customers will pay the bill, so the affordability of these investments is as important as enabling the future energy platform and maintaining high levels of reliability. Pepco evaluated many different alternatives to the Capital Grid Project and found that the Capital Grid Project, as proposed, resulted in the greatest value to District of Columbia customers, addressing the myriad of system needs, cost-effectively, while continuing to increase the capacity and capability of the system to advance and enable a clean energy future.

These innovative technologies and services that are available to customers, such as rooftop solar, EV charging and storage rely on the grid to be enabled. The grid needs to be more connected and more resilient than it has ever been. The grid must be better able to safely and reliably interconnect the increasing number and variety of DER that make the clean energy future a reality.

For these reasons, the Capital Grid Project is necessary, reasonable and safe, providing for increasing levels of flexibility and resiliency, and should be approved as proposed.

As Pepco evaluated the electric grid within the District of Columbia, it identified several areas that require additional attention and investment. Two of the substations and the supply lines to those substations necessary to supply reliable electricity to District of Columbia homes and businesses are aged and in need of replacement. It will also improve the reliability of certain radial distribution feeders in the service area. In addition, rapid load growth forecasted in the Mt. Vernon Triangle, NoMa, Capitol Crossing, and Northwest One areas in the District of Columbia cannot be supported by the current infrastructure and necessitate construction of a new substation. Moreover, although the current radial configuration of the District of Columbia transmission system has been adequate to reliably serve the load in the District of Columbia, it is susceptible to low probability high impact events. If an extreme event were to impact any one of the four transmission pathways, customers within the District of Columbia could be without power for extended periods of time. Finally, investment is necessary to upgrade and enhance the existing infrastructure in the District of Columbia to be able to deliver on the District's aggressive Renewable Energy Portfolio Standard ("RPS") goals and sustainability requirements and to meet the modernization expectations of the District, the Commission and customers.

Importantly, the Capital Grid Project also will support system modernization in a number of ways. Part of Pepco's modernization process includes incorporating DER on the distribution system and deferring wires investments with non-wires solutions. Pepco is actively exploring alternative solutions to defer wires investments in a manner that will safely, reliably, and economically manage increasing loads. Pepco's approach is first to look for small-scale projects that would allow for quick remediation should the alternative solution cause unforeseeable negative impacts on any component of the system. Pepco has identified a deferral project as part of the Capital Grid Project that will increase Pepco's understanding of the responsible deferral of wires solutions through use of DER on the distribution system. As part of the Capital Grid Project, Pepco is proposing to install a storage unit in the Mt. Vernon Substation that will allow it to defer the fourth transformer. Because only three of the transformers in the Mt. Vernon Substation are needed by 2023, the storage battery will be used to gain an understanding of the impacts of storage on the distribution system and to defer the fourth transformer when the transformer would otherwise be needed.

The Capital Grid Project also will increase the hosting capacity within the District of Columbia and increase the ability to safely and reliably interconnect DER to Pepco's distribution system.

Finally, in addition to the reliability, resiliency, and sustainability benefits, the project results in an increase in economic activity associated with professional services required to construct the facilities, benefitting the District of Columbia and generating increased opportunities for minority, women, veteran and disabled local businesses and contractors to support the project. For example, the labor income for the District of Columbia associated with the Capital Grid Project is estimated at $63,440,708 and the GDP benefit is estimated at $85,685,724.

By contrast, the Synapse Study offers flawed analyses and cannot be relied upon as a non-wires solution that can defer the Mt. Vernon Substation. The study has failed to identify the extent of the need that its purported non-wires solution is planned to defer, thereby placing at risk the reliable service of 7,400 residential customers and 270 commercial customers, a total of over 100 MVA of load. The Synapse Study makes overly optimistic assumptions about peak load reductions that can be gained from EE and DR, assumptions that are unsupported by the realities of the District of Columbia and the study's own evidence. The Synapse Study further bases its analysis and conclusions on an incorrect identification of the customers and areas that will be served by the Mt. Vernon Substation, resulting in proposed solutions that are not tailored to the realities of the system and would leave customers at undue risk. The study cannot be relied upon to present an alternative to the Mt. Vernon Substation and should be rejected.

The Mt. Vernon Substation is an important part of a forward-looking plan that will strengthen the Capital area energy grid over the long term, promoting enhanced reliability and resiliency while creating smarter energy infrastructure to accommodate new growth and enable the clean energy future. The Capital Grid Project is necessary, reasonable and safe and delivers on Pepco's responsibility to provide safe, reliable, and affordable and sustainable energy to District of Columbia customers and communities.

II. Response

A. Pepco Is Committed to Adding New, Innovative Technologies and Alternative Solutions, including DER, to Its System in a Manner that Allows It to Provide Safe and Reliable Service

The use of non-wires solutions to defer traditional wires investment is an important advancement in the distribution of electricity in the District of Columbia. As with other innovative technologies, Pepco is committed to this advancement and is actively looking for opportunities to use non-wires solutions to defer wires solutions for load projects on its system. In moving forward with non-wires solutions and other innovative technologies, Pepco must ensure the safe and reliable distribution of electricity to its customers. Taking into consideration the unique characteristics of the District of Columbia and its distribution system, Pepco is looking for deferral projects that will allow customers to enjoy the benefits of the alternative solutions while assuring that Pepco can continue to provide safe and reliable service.

Delivering state-of-the-art innovation and modernization of the electric grid to benefit customers is inherent in the public utility responsibilities of Pepco, and Pepco's investments to date have created the reliable electric delivery system that powers the District of Columbia. When Pepco makes planning decisions about its system, it examines available technologies and makes the necessary upgrades in a way that continues to modernize the system and maintain reliability for all customers. Pepco's distribution system of today is more advanced than the system was even a few years ago and far more advanced than decades ago. These innovations made in the normal course of operations, while often imperceptible to many external stakeholders, have significantly extended system capabilities over time and are creating the modern grid required to support increased deployment of DER and viable alternatives to traditional capital investment. At the forefront when Pepco makes these planning decisions are both the cost to of the investments to customers and Pepco's obligation to provide customers reliable service.

Pepco continues to develop its distribution system through state-of-the-art investments. The integration of advanced metering infrastructure ("AMI") technology and resulting data into Pepco's load forecasting and planning processes for DER, new information technology upgrades to expand support for Community Renewable Energy Facilities, and DER-related deployment of smart inverters are examples of more recent system innovations that support the deployment of DER[8] and improve the Pepco customer experience. The Company has provided customers access to detailed hourly energy use data and the ability to share that data with selected developers. Pepco was among the first utilities in the country to adopt the White House Green

[8] *See In the Matter of the Investigation In Modernizing the Energy Delivery System for Increased Sustainability*, Comments of Potomac Electric Power Company, Formal Case No. 1130 (Apr. 10, 2017) ("Pepco MEDSIS Staff Report Comments") at 2-3 (providing examples of actions by Pepco in modernizing the electric distribution system).

Button Initiative, which allows customers to access their detailed hourly energy consumption data and the ability to share that data with energy suppliers. Resource Advisor (for the DC Benchmarking Mandate) allows building owners to see their entire building data in aggregate. The "Request Customer Usage" tool on Pepco's website provides secure access for contractors to obtain authorization to access and download customer energy usage data, allowing contractors to more accurately assess customer DER system requirements through the use of historical usage information that is requested and accessed electronically. Residential customers can access MyAccount on the Pepco webpage or sign a paper release, which can be uploaded to the Request Customer Usage module. Finally, CEO (Chief Energy Officer) is an online tool enabling the larger NEM customers who cannot access data via My Account to see their usage.

Pepco also provides on its website state-of-the-art tools for customers interested in connecting DER to Pepco's system. Pepco provides WattPlan, an online service to help customers estimate the potential electricity generation and savings based on their specific rooftop characteristics, historical usage, current rates, and available rebates and credits. Customers are able to create a personal estimate, view side-by-side comparison of financing options and learn more about the interconnection process. Pepco also makes available a Hosting Capacity Map that provides data that customers can use to determine if solar or other DER can be accommodated at their home and developers can use to help size or site large projects. The Company provides an interactive cross-border feeder map to help customers identify potential project locations in Maryland that may be eligible for Solar Renewable Energy Credits ("SRECs") in the District of Columbia, the first of its kind in the industry. Pepco hosts a Restricted Circuit Map that provides information regarding circuits that are no longer accepting additional DER installations, without distribution system upgrades, because the feeder has reached the DER threshold after which violations of voltage operating limits or other dangerous conditions may occur.[9] An Acceptable Inverters List is posted on the website that provides a list of inverters that meet the applicable standards to be used on Pepco's distribution system. Finally, Pepco provides a Solar Heat Map in an effort to provide more information to customers regarding the amount of solar generation that is currently installed and pending install on circuits. The map is color-coded and can be filtered to display the active projects only, pending queued projects only, or the combination of active and pending queued projects. The user is able to put the cursor over the feeder and see the actual amounts of solar (installed or pending queued or both) and any circuit restrictions.

Pepco also has offered numerous demand response and energy efficiency and conservation programs, including time-of-use rates, electric demand charges, residential air conditioning cycling programs, non-residential demand response programs, and numerous residential energy efficiency and conservation programs.[10]

Underlying every decision that Pepco makes to modernize its distribution system, however, is recognition of its obligation to provide its customers safe and reliable electric service. As the local electric utility, Pepco is charged with making investments in the electric distribution system, which it owns and operates, to improve reliability and customer satisfaction. Those investments—for which Pepco is always accountable to the Commission and ultimately its customers—must address the short- and long-term needs of an electric system infrastructure while also being prudent, safe and reliable.

[9] There are currently no restricted circuits in the District of Columbia.

[10] The mix of programs Pepco is permitted to offer at any time is dependent upon Commission and legislative authorizations.

Pepco incorporates any new technology into its system in a manner that allows for adequate testing and learning in anticipation of a broader rollout after the technology is proven on Pepco's District of Columbia distribution system. By taking this approach, Pepco is able to incorporate new technologies without degrading safety, reliability or customer satisfaction. Deployment of non-wires solutions is no different.

With clear "line of sight" of day-to-day, system-wide utility operations, Pepco is in the best position to leverage existing utility infrastructure to control costs and ensure both continued focus on the essential safety and reliability of core distribution system operation and the introduction of new technologies and other functionality that are appropriately delivered by the local electric distribution company. Moreover, it is Pepco—not Synapse, DOEE or any other entity—that people will turn to if the superior reliability that they currently experience begins to falter. Pepco is actively exploring non-wires deferral projects in a manner that will safely and reliably manage increasing loads. Taking into consideration the unique characteristics of the District of Columbia and its distribution system, Pepco is looking in the District of Columbia first for smaller-scale projects that would allow for quick remediation should the alternative solution cause unforeseeable negative impacts on any component of the system. In other jurisdictions, Pepco Holdings has been able to identify larger-scale non-wires deferral projects, such as a substation supplied by overhead lines. Given the dense urban load, the lack of space for siting batteries necessary to reliably support the low voltage alternating current ("LVAC") network groups and other unique systems in the District of Columbia, large deferral projects are more difficult to identify in the District of Columbia. In all cases, Pepco projects for which non-wires solutions may be considered are based on demonstrable current or forecasted needs that are often driven by load growth. Any proposed non-wires solution must consistently deliver a level of reliability commensurate with the initially-identified traditional solution.

Pepco has identified such a project in the District of Columbia. As part of its Capital Grid Project application, Pepco is proposing a project that will defer a significant investment in the Mt. Vernon Substation and can be used to pave the way to prudently implement larger-scale deferrals in the future. As discussed in more detail below, the Mt. Vernon Substation will be built as a standard 210 MVA substation. The forecasted need for the Mt. Vernon Substation is only for 140 MVA of the 210 MVA by 2023. The final 70 MVA will be provided by the addition of the fourth transformer, which currently is forecasted to be needed some time after 2028. Pepco proposes to use a non-wires solution (battery energy storage) to defer the need for the fourth Mt. Vernon Substation transformer as a deferral project, accomplishing Pepco's need for 140 MVA by 2023 and allowing Pepco, stakeholders and customers to enjoy the benefits of a non-wires solution on a scale that will continue to deliver reliability commensurate with the installation of the transformer it is deferring. During the period between which the battery is installed and the deferral of the transformer becomes necessary, Pepco is able to use the battery to create scenarios that will increase learning about using non-wires solutions within the downtown distribution system. Pepco is also actively evaluating other battery energy storage projects in the District of Columbia and in its other jurisdictions that would provide valuable learning regarding how to use battery energy storage in lieu of wires solutions in a manner that would ensure safe and reliable electric service to Pepco's customers. As previously discussed, Pepco has identified an opportunity to defer a substation supplied by overhead lines in Maryland using battery storage and continues to look at other potential options.

B. Mt. Vernon Substation is Necessary to Ensure Reliable Electric Service to District of Columbia Customers

While the safe and reliable deferral of future substations in the District of Columbia using alternative solutions may be on the horizon, Mt. Vernon Substation is necessary now. The proposed Mt. Vernon Substation—which currently has an in-service date of 2023—will be a high-capacity, permanent 230 kV/13 kV substation that initially will provide 140 MVA of firm capacity, with ultimate firm capacity of 210 MVA. This substation is needed to provide load relief to the Northeast Sub. 212 Southwest LVAC Network Feeder Group, the New Jersey Ave. Sub. 161 South LVAC Network Feeder Group, the Northeast Substation, and the Tenth Street Substation. These distribution capabilities have been previously expanded to their maximum capacity and would otherwise be overloaded or near full capacity as early as 2023 if the Mt. Vernon Substation were not constructed.

The cause of the initial overload is the rapid and dynamic load growth that is currently occurring and forecasted to occur in the Mt. Vernon Triangle, NoMa, Capitol Crossing, and Northwest One areas. Many of the areas that have recently been parking lots or empty buildings with minimal load requirements are being developed into high-load, multi-unit buildings. For example, the parking lot in Figure 1, located at North Capitol Street, NW and K Street, NW, is one block from the site of the proposed Mt. Vernon Substation and will be developed by MRP as part of the larger Northwest One revitalization area. The MRP development will consist of approximately 56,500 square feet of retail and over 800 residential units (rendering in Figure 1).

Figure 1

Transforming a parking lot or low load building into a mixed-use development, such as Northwest One, results in a significant amount of load being added to the distribution system. In the case of the MRP buildings, the development will add 2.8 MVA of load to the system.

The increase in load is studied and quantified for planning purposes and results first in a determination of how much load is being added—and where it is planned to be added—through

Prospective New Businesses ("PNBs") and, second, how the expected PNBs will affect future system needs. Using data from requests for electric service, various real estate development reports, various media sources, and Pepco site visits, a summary of all the recently completed, in progress, and planned construction projects was assembled for these areas using the parameters and assumptions that are part of Pepco's short- and long-term load forecasting process. For load-driven projects, such as the Mt. Vernon Substation, the Capacity Planning group reassesses the status of the PNBs every year. To the extent that the PNBs are behind schedule and the load is not materializing in the timeframe originally forecasted, Pepco will adjust the in-service date of load-driven projects based on the most recent assessment of the forecasted load. In the 2018 annual assessment, for example, the Mt. Vernon Substation in-service date was pushed back from 2022 to 2023 because the PNBs were behind schedule. This annual assessment process ensures that Pepco does not construct a load project before it is necessary. The annual assessment—which includes the assessment of impact of DER interconnected with the distribution system—is the reason that Pepco filed the original Notice of Construction for only the Harvard and Champlain Substations, allowing Pepco to continue to assess the need date for the Mt. Vernon Substation.[11] There is a point, however, at which further reassessments would jeopardize the project due to the lead time for approval, permitting and construction of the project. According to the most current annual assessment, Pepco will reach this point with the Mt. Vernon Substation in 2019.

The Mt. Vernon Triangle, NoMa, Capitol Crossing, and Northwest One areas (currently served by Florida Avenue Substation, New Jersey Avenue Substation, Northeast Substation and

[11] By excluding the Mt. Vernon Substation, Pepco had more time to understand the positive impacts of DER and was able to wait until the load materialized in the area where the Mt. Vernon Substation would need to be built. Pepco has, since at least 2013, laid the groundwork to explain that the Mt. Vernon Substation would be needed in the future. Pepco is formally proposing construction of the Mt. Vernon Substation for the first time in this NOC.

Tenth Street Substation) are and will be experiencing significant new growth, with approximately 126 MW of load from 132 new developments scheduled to be added over the next ten years. Table 1 shows the number of apartment units, hotel units, retail square footage and office square footage that are being added to the area to be served by the Mt. Vernon Substation starting in 2023. The load that each of the current substations will serve is also provided.

Table 1[12]

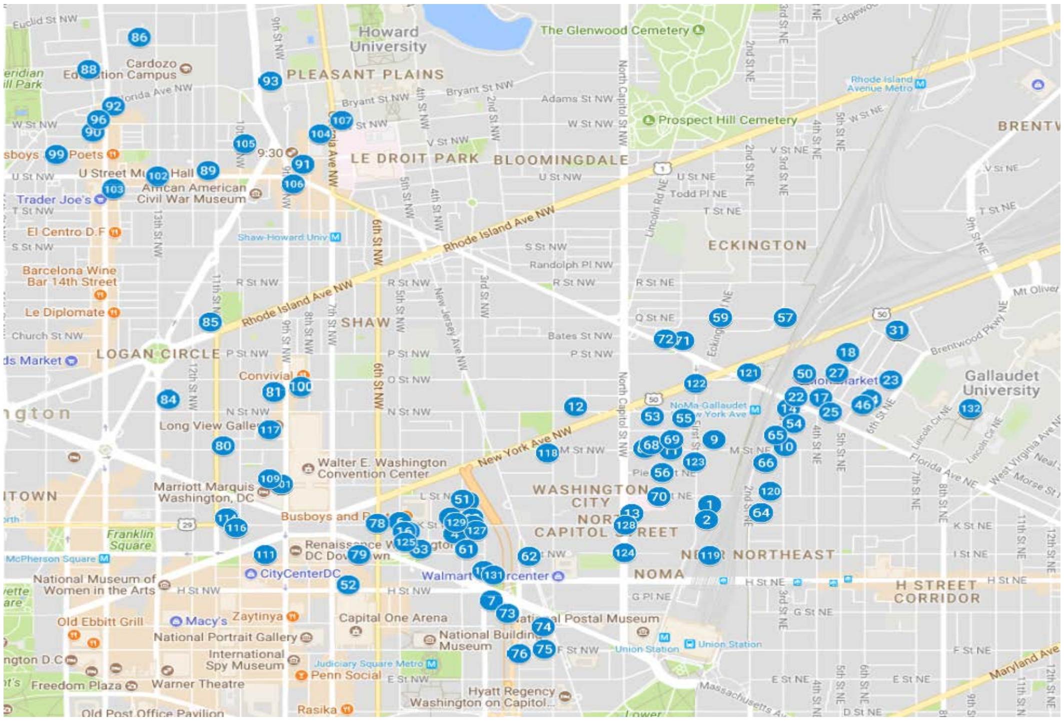
Substation/Feeder Group	Number of Apartments	Number of Hotel Rooms	Retail Sq. Ft.	Office Sq. Ft.	New Load (MW)
Florida Ave. Sub	1,799	0	214,500	0	7
New Jersey Ave. Sub. 161	918	0	219,000	399,000	5*
Northeast Sub. 212	14,520	1,311	2,240,558	6,139,000	102*
Tenth Street Sub. 52	811	1,061	111,800	1,080,000	12*
TOTAL	**18,048**	**2,372**	**2,785,858**	**7,618,000**	**126***

* 11 MW are partially in service and have been removed from Table 1.

Figure 2 shows where the new development is occurring. The specific developments and development details are provided in Attachment A.

[12] Note that the above information is based on the best information available to date. Developers frequently alter the use and scope of their future developments as market conditions warrant.

Figure 2



As demonstrated in Attachment A, PNBs in this area are projected to increase load rapidly, with over 102 MW being added by 2023 and another 24 MW forecasted by 2027. All of this new load is developing around the Florida Ave., New Jersey Ave., the Northeast, and the Tenth Street Substations, the areas that the Mt. Vernon Substation is designed to serve.

Table 2 below shows the forecasted load for the Northeast Sub. 212 Southwest LVAC Network Feeder Group, the New Jersey Sub. 161 South LVAC Network Feeder Group, the Northeast Substation, and the Tenth Street Substation in years 2023-2027 without construction of the Mt. Vernon Substation. The result of all of the additional load growth is that the current configuration of Northeast Sub. 212 Southwest LVAC Network Feeder Group will overload by approximately 5% in 2023 without sufficient capacity at any current feeder group and without enough feeder positions to extend new feeder groups from other substations to take the load. The surrounding feeder groups and substations will also be nearing 100% of capacity in 2023.

The New Jersey Sub. 161 South LVAC Network Feeder Group will be at 99% capacity, the Northeast Substation is at 96% capacity, and the Tenth St. Substation is at 94% capacity in 2023.

The New Jersey Sub. 161 South LVAC Network Feeder Group is predicted to reach 99% of its group firm capacity in 2020 and will continue at 99%/100% through 2024 after which the entire feeder group will overload. Individual feeders within an LVAC network group typically overload at lower levels of firm capacity than the feeder group as a whole under N-1 contingency scenarios. During the five years that the New Jersey Sub. 161 South LVAC Network Feeder Group is operating at 99%/100%, because load is not perfectly balanced across the feeders, individual feeders will likely overload. Even if none of the individual feeders were to overload, however, operating the feeder group at this high loading for this sustained period increases the risk of damaging individual feeders in the group and exposing the customers supplied by this group to long-term outages. This prolonged overstressing of the feeder group places customers at risk of outages.

For these reasons, Pepco typically initiates a construction project to reduce the total group load when the feeder group load exceeds approximately 95% of group firm capacity in order to avoid the overstressing of individual feeders in that group. Temporary emergency operating actions can usually be taken in the field to reduce individual feeder loads within a group but doing so exposes individual customers to additional risk of an outage by reducing the number of feeders supplying them during the emergency. When Pepco planned the Mt. Vernon Substation, it planned for the substation to relieve the load from the New Jersey Avenue Sub. 161 South Network Feeder Group. Pepco determined that it could tolerate the risk to the network group until the Mt. Vernon Substation was constructed, knowing that the new substation would reduce the group load and the individual feeder loads. With the in-service date of 2023 for the Mt.

Vernon Substation, this risk will have already been tolerated for three summer peak periods. Any further toleration of this risk is not in the best interest of the customers served.

Table 2

		Northeast Sub. Southwest LVAC Firm Capacity: 50MVA			
	2023[13]	**2024**	**2025**	**2026**	**2027**
LVAC Loading (MVA)	52.7	56.1	57.3	59.2	59.9
Load over Capacity (MVA)	2.7	6.1	7.3	9.2	9.9
Firm Capacity Overload	5%	12%	15%	18%	20%
		New Jersey Sub. South LVAC Firm Capacity: 47.5MVA			
	2023	**2024**	**2025**	**2026**	**2027**
Loading (MVA)	47.2	47.2	47.7	48.2	48.7
Load over Capacity (MVA)	0	0	0.2	0.7	1.2
Firm Capacity Overload	0%	0%	.004%	1%	3%
		Northeast Substation Firm Capacity: 214MVA			
	2023	**2024**	**2025**	**2026**	**2027**
Loading (MVA)	204.8	213.6	218.2	223.4	227.5
Load over Capacity (MVA)	0	0	4.2	9.4	13.5
Firm Capacity Overload	0%	0%	2%	4%	6%
		Tenth St. Substation Firm Capacity: 204VA			
	2023	**2024**	**2025**	**2026**	**2027**
Loading (MVA)	191.4	192.3	193.7	194.2	194.7
Percentage of Firm Capacity	94%	94%	95%	95%	95%

Under the current configuration, the significant load growth occurring in the Mt. Vernon Triangle, NoMa, Capitol Crossing, and Northwest One areas will increasingly stress the existing substations and network groups every year, expanding the overloading conditions to other feeder groups and substations starting in 2025. By 2025, the Northeast Sub. 212 Southwest LVAC

[13] The most recent annual assessment of PNBs indicated that the in-service date for the Mt. Vernon Substation should be moved to 2023 and that the load growth will result in a larger overload in the year that the substation is needed. The overload on the Northeast Sub. 212 Southwest LVAC Network Feeder Group increased from the 2.2 MVA in 2022, as identified in the Synapse Study, to 2.7 MVA in 2023.

Network Feeder Group will be overloaded by approximately 7.3 MVA. The New Jersey Sub. 161 South LVAC Network Feeder Group, which will have operated at 99%/100% capacity for the previous five years, will be overloaded by 0.2 MVA, Northeast Substation will be overloaded by 4.2 MVA, and the Tenth Street Substation will be at 95% capacity. By 2027, the Northeast Sub. 212 Southwest LVAC Network Feeder Group will be overloaded by 9.9 MVA, the New Jersey Sub. 161 South LVAC Network Feeder Group will be overloaded by 1.2 MVA, the Northeast Substation will be overloaded by 13.5 MVA, and the Tenth Street Substation will be at 95% capacity. Without the Mt. Vernon Substation, there is limited ability to transfer load off the Northeast Sub. 212 Southwest LVAC Network Feeder Group or the New Jersey Sub. 161 South LVAC Network Feeder Group to the surrounding feeder groups or substations should emergency load shedding be required, for example if an alternative used to defer the Mt. Vernon Substation were to fail. Because of the lead time necessary for construction of the Mt. Vernon Substation, constructing the substation on an emergency basis would not be an option.

Moreover, the current load forecasts do not incorporate load growth due to rapid growth in the electric vehicle ("EV") sector. Pepco, the District and other stakeholders are actively seeking to invigorate the EV market. The District has legislation to increase the level of public charging in the District of Columbia.[14] Further, the MEDSIS proceeding has a focus on EVs, including a proposal that Pepco will be filing this summer after significant stakeholder input and collaboration. Should the legislation and an EV program through MEDSIS be implemented, EV charging will add significant load in specific areas around the city. Given its location and the new development in the areas, there are likely to be charging stations in the area served by the Mt. Vernon Substation. If the Mt. Vernon Substation is constructed as proposed, it would be

[14] D.C. Pub. Law L22-0078.

able to serve the load that EV charging would require. If an alternative solution is used based on current forecasts and the forecasts change due to the growth of the EV market, there is no guarantee that a solution that is focused on shaving a particular level of current load could reliably serve the area.

The Mt. Vernon Substation will prevent the overload and overstress conditions by providing a reliable and safe substation to which much of the load can be transferred. As shown in Table 3 below, with the Mt. Vernon Substation relieving the surrounding substations and feeder groups, all of the overload and overstress conditions are mitigated, leaving additional firm capacity at all of the substations and on all of the LVAC network groups to allow for future scheduled load transfers, emergency load transfers, and future load growth.

Table 3

		Northeast Sub. Southwest LVAC Firm Capacity: 50MVA			
	2023	**2024**	**2025**	**2026**	**2027**
LVAC Loading (MVA)	12.7	16.1	17.3	19.2	19.9

Remaining Firm Capacity (MVA)	29.3	28.4	27	26.5	26
		Mt. Vernon Substation Firm Capacity: 140MVA			
	2023	**2024**	**2025**	**2026**	**2027**
Loading (MVA)	56.7	76.7	84.4	84.4	84.4
Remaining Firm Capacity (MVA)	83.3	63.3	55.6	55.6	55.6

The Mt. Vernon Substation is reasonable and necessary to provide safe and reliable service to the distribution customers it will serve. In this instance, the traditional wires solution of a substation is the only alternative. Pepco does not yet have adequate evidence that non-wires solutions can provide a safe and reliable solution to the system need that the Mt. Vernon Substation will address. Pepco should not be using as its first deferral project on the complex

District of Columbia distribution system an alternative solution that attempts to defer the entire Mt. Vernon Substation, a component of the system that has a long lead time for design and construction and, as further discussed below, is complicated by its interdependency with the LVAC network groups and other underground systems in the District of Columbia. Instead, Pepco should be allowed to begin with smaller projects that would allow Pepco to remedy any failure quickly with a proven wires-based alternative. District of Columbia customers deserve solutions that can continue to provide the same level of safe and reliable service that is currently being provided through traditional wires-based solutions and the Commission should demand nothing less. An unreliable alternative to the Mt. Vernon Substation would unnecessarily place 7,400 residential and 270 commercial customers, representing 100.1 MVA of load at risk of extended outages.[15]

C. The Synapse Study Does Not Recognize the Full Extent of the Need for the Mt. Vernon Substation, Resulting in Solutions that Will Present Unacceptable Reliability Risks to Customers

The Synapse Study misidentifies significant fundamental facts relating to the need for the Mt. Vernon Substation. The failure to correctly understand the need results in a proposed "solution" that significantly understates the amount of capacity required to supply the customers impacted by the deferral of the substation. As a result, the Synapse Study's proposal to defer the construction of the Mt. Vernon Substation will subject customers to an unacceptably high risk of degraded service reliability.

Because the Synapse Study does not account for the nature of the District of Columbia LVAC system or the basic facts underlying Pepco's load forecast, it has created a "solution" that

[15] These are the customers and customer loads on the Northeast Sub. 212 Southwest LVAC Network Feeder Group and the New Jersey Sub. 161 South LVAC Network Feeder Group.

would not allow Pepco to safely serve its customers under peak conditions and would unnecessarily place 7,400 residential and 270 commercial customers, representing 100.1 MVA of load, at unreasonable risk of extended outages. According to the Synapse Study, shaving 2.2 MVA in 2022[16] off of the Northeast Sub. 212 Southwest LVAC Network Feeder Group will safely relieve the overload conditions and will allow Pepco to defer the Mt. Vernon Substation for one year.[17] However, the Synapse Study has oversimplified the load reduction requirements to defer the Mt. Vernon Substation.

First, the Northeast Sub. 212 Southwest LVAC Network Feeder Group overload is not the only driver for the Mt. Vernon Substation. As discussed above, while the New Jersey Sub. 161 South LVAC Network Feeder Group will not overload until 2025, it will have been overstressed for three years by 2023. Operating the feeder group at this high loading for a sustained period increases the risk of damaging individual feeders in the group and exposing the customers supplied by this group to the impact of long-term outages. This overstressing was planned to be relieved by the Mt. Vernon Substation in 2023. Should the Mt. Vernon Substation be deferred, the non-wires solution would also need to relieve the load on the New Jersey Sub. 161 South LVAC Network Feeder Group.

Second, the Synapse Study's assumptions regarding load relief on the Northeast Sub. 212 Southwest LVAC Network Feeder Group are wrong as well. To understand why the Synapse Study's assumptions are wrong, it is important first to understand what the Northeast Sub. 212 Southwest LVAC Network Feeder Group is, how it operates in outage conditions and how Pepco must plan to ensure safe and reliable service to customers. Pepco plans its LVAC network

16 Because the 2018 PNB assessment moved the in-service date to 2023, the overload is 2.7 MVA in 2023. The remainder of the discussion in this response will refer to the 2.7 MVA in 2023 rather than the 2.2 MVA in 2022.
17 Synapse Study at 49.

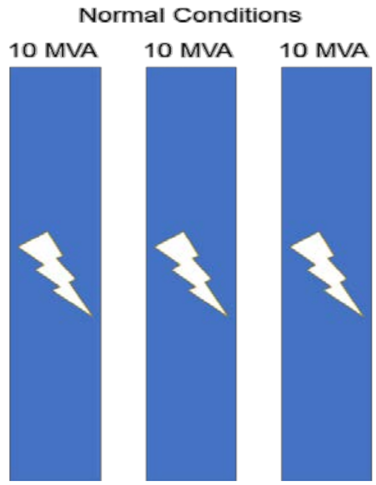
distribution system for an N-1 design contingency conditions,[18] meaning that if one feeder in a network group experiences an outage, the load normally supplied by that feeder is redistributed among the remaining feeders and those feeders must be able to carry the additional load. During an N-1 contingency (outage) on an LVAC network group, an entire feeder experiencing the outage and its associated transformers are removed from service. Because this LVAC network group consists of six (6) interconnected feeders, the load from the feeder experiencing an outage is carried by the remaining five (5) feeders in the LVAC network group and adjacent transformers.

The 2.7 MVA firm capacity overload described above in 2023 is under normal conditions. That means that if nothing is done to change the current configuration, there will be an overload of 2.7 MVA on the Northeast Sub. 212 Southwest LVAC Network Feeder Group when all 6 feeders are in operation. Under an N-1 contingency for a six feeder LVAC network group, such as the Northeast Sub. 212 Southwest LVAC Network Feeder Group or the New Jersey Sub. 161 South LVAC Network Feeder Group, the remaining five feeders in the LVAC feeder group must be able to carry the load from the feeder experiencing the outage. Thus, the load that Pepco must actually plan for is significantly higher.

A simple illustrative example helps make clear why this is the case. In this example, in a 3-feeder LVAC network feeder group each feeder has a maximum capacity under normal conditions of 9 MVA, and a maximum capacity under emergency (N-1) conditions of 10 MVA. Figure 3 assumes a 3 MVA overload under normal conditions that is spread equally across all three feeders, thus each feeder is currently carrying 10 MVA of load.

[18] Pepco Distribution System Planning and Design Criteria Section IV(C)(3): "The distribution system will be developed so that it can be operated at all load levels without interruption of load for the following unscheduled contingencies: . . . (c) The loss of a single circuit in a network feeder group or a high voltage customer vault with two or more supply feeders. (Exception - where the customer has failed to install recommended equipment)."

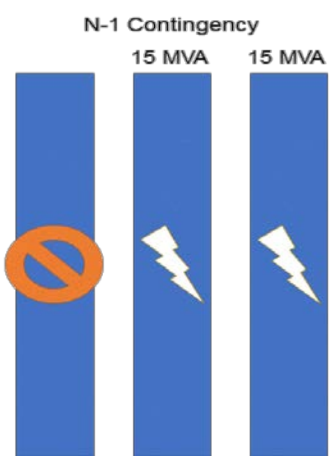
Figure 3



Under an N-1 contingency, one of the three feeders is lost. Figure 4 shows (through three different examples) that the 10 MVA from the feeder experiencing the outage is the redistributed to the two remaining feeders.

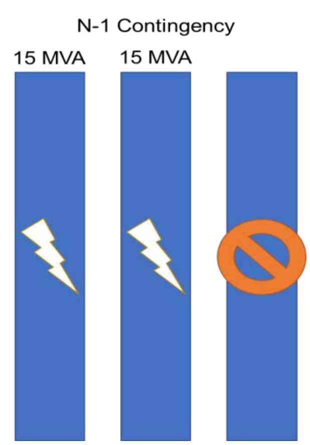
Figure 4

Example 1



Example 2

Example 3



Under an N-1 contingency, the overload is measured against the emergency rating, which in this example, is 10 MVA. Thus, when planning for an N-1 contingency, instead of planning for a 3 MVA overload, the feeder group must be able to accommodate a 10 MVA overload. If Pepco planned only for the 3 MVA overload, the entire feeder group would suffer an outage if any single feeder suffered an outage. In addition, because planning must account for each of the three N-1 contingency examples above, if using, for example, batteries in lieu of a substation, there would need to be a battery on each of the 3 feeders in the LVAC network group, and the batteries on the LVAC network group would need to cover the entire 15 MVA load above the emergency loading that would occur in an N-1 contingency.

Looking back at the real-life situation on the Northeast Sub. 212 Southwest LVAC Network Feeder Group, under normal conditions the feeder group will experience an overload of 2.7 MVA in 2023. Unlike the simple example, in the real-world load is not balanced perfectly across the six feeders. It may be that the entire 2.7 MVA overload is on a single feeder. Should that feeder experience an outage, the load that the other feeders must support would be even higher. Thus, if using DER in lieu of a substation, Pepco would have to deploy DER (*e.g.*, batteries) or other demand reduction over all of the feeders in the network group in a manner that would successfully relieve the potential overloads under any of the possible N-1 conditions. Because of the uncertainty about which contingency scenario might occur, the total amount of DER or other load reduction deployed would have to be greater than the sum of the load exceeding capacity (2.7 MVA). Under real-world conditions, if DER were used to defer the Mt. Vernon Substation, it would need to cover between 13.3 MVA and 17.3 MVA, depending on the portfolio used to defer the substation.

The assumption in the Synapse Study that by shaving 2.7 MVA of load in 2023 Pepco could defer the Mt. Vernon Substation and provide safe and reliable service to its customers is incorrect, resulting in a deferral solution that would jeopardize reliable distribution service for the customers on the Northeast Sub. 212 Southwest LVAC Network Feeder Group and the New Jersey Sub. 161 South LVAC Network Feeder Group. And, as explained above, because Pepco requires 3-4 years of construction after all permits and approvals are received to build a project the size of the Mt. Vernon Substation, the consequences could be amplified exponentially should the chosen alternative solution fail and the Mt. Vernon Substation be required to provide safe and reliable service to the customers on the two LVAC network groups and the two substations that the Mt. Vernon Substation is being constructed to relieve. Without the Mt. Vernon Substation, the increased stress on the Northeast Sub. 212 Southwest LVAC Network Group and the New Jersey Sub. 161 South LVAC Network Feeder Group in an N-1 contingency under peak loading conditions could result in a cascading failure in which one overloaded feeder fails and its load is carried by the remaining feeders in the network group which, in turn, overloads the remaining feeders and results in the loss of all six feeders comprising each of the Northeast Sub. 212 Southwest LVAC Network Feeder Group and the New Jersey Sub. 161 South LVAC Network Feeder Group. This catastrophic failure would result in extended outages for the entire Northeast Sub. 212 Southwest LVAC Network Feeder Group's approximately 6,700 residential and 150 commercial customers, representing 52.7 MVA of load, and the New Jersey Sub. 161 South LVAC Network Feeder Group's entire 700 residential customers and 120 commercial customers (including Union Station and certain federal government buildings), representing 47.2 MVA of load.

The Synapse Study has defined the problem incorrectly and, in doing so, the study's solution is inadequate. Moreover, the Synapse Study and the DOEE Comments fail to discuss the consequences should the proposed alternative solution fail to provide reliable service to District of Columbia customers and how such a circumstance would be addressed. The study's proposed solution creates unreasonable risk to customers and should be rejected.

D. The Synapse Study Contains Significant Additional Errors, Unrealistic Assumptions, and Technical Flaws that Further Undermine Its Credibility

As discussed previously, Pepco's choice to build the Mt. Vernon Substation is based on its responsibility to ensure the reliable delivery of electricity to residential and commercial customers in the District of Columbia, and the substation is a proven means to fulfill to that obligation. But, unlike the certainty provided by a proven solution such as the construction of a substation, there is significant uncertainty about the viability of the alternatives that the Synapse Study proposes that Pepco rely upon as a possible solution to the system needs. This is especially concerning given that an uncertain solution places at risk the reliability of electric service to thousands of customers. In addition to the problems with the Synapse Study discussed previously, the Synapse Study contains significant additional errors, unrealistic assumptions, and technical flaws. These problems lead to an overly optimistic portrayal of the Synapse Study's recommendations, further undermining the study's credibility. In short, while Pepco has proposed a proven solution after careful consideration and examination of its distribution system, the Synapse Study relies upon overly optimistic and, in many cases, flawed assumptions regarding uncertain alternatives that would place undue risk on the reliability of electric service for District of Columbia customers.

1. The Synapse Study Bases Its Analysis and Conclusions on an Incorrect Identification of the Customers and Areas that Will Be Served by the Mt. Vernon Substation, Resulting in Proposed Solutions that Are Not Tailored to the Realities of the System and Would Leave Customers at Undue Risk.

The Synapse Study bases its analysis and conclusions on an inaccurate identification of customers being served by the Mt. Vernon Substation—the Northeast Sub. 212 Southwest LVAC Network Feeder Group, the New Jersey Ave. Sub. 161 LVAC Network Feeder Group, the Northeast Substation 212, and the Tenth Street Substation 52. This is critically important, because the first step in distribution planning is to identify the specific geographic regions, the expected mix of customers and the forecasted electric loads that will be affected by any project under consideration. In the absence of this information, adequate distribution planning cannot occur, including evaluation of a potential new substation or the possible use of non-wires alternatives.

The Synapse Study identifies the Northeast Sub. 212 Southwest Network Feeder Group as the key peak load that must be reduced to defer the Mt. Vernon Substation. Table 4 represents the buildings on which the Synapse Study based its analysis of the Northeast Sub. 212 Southwest LVAC Network Feeder Group and shows the inaccurate assumptions made in the study. The four buildings that are crossed out are not served by the Northeast Sub. 212 Southwest LVAC Network Feeder Group.

Table 4

Address	Size (sq. ft.)	Load in peak hour (kW)

251 H St. NW	93,877	298
301 Massachusetts Ave. NW	68,989	201

The Synapse Study has misidentified 10,602 kW of the total 21,165 kW—or 50%—of the existing load that it assumed would be served by the Northeast Sub. 212 Southwest LVAC Network Feeder Group when creating its proposal for deferring the Mt. Vernon Substation.

The Synapse Study's failure to correctly identify the applicable customer base is evident throughout the study. In its Figure 1, the study purports to represent the "approximate location of substations and portions of the electric grid discussed in [the] report." However, the areas circled are supplied primarily by Northeast Sub. 212 Southeast LVAC and the South Spot Network Feeder Groups, neither of which is the subject of the study. Further, the Synapse Study's assertion that the Northeast Substation serves three load areas is incorrect.[19] In fact, the substation serves six load areas: the Southwest LVAC Network Feeder Group, the West Network Feeder Group, the Southeast Spot Network Feeder Group, the South Spot Network Feeder Group, the North High Voltage Group, and a two radial distribution feeder system. The study also incorrectly asserts that

> [t]he SW Network Group serves the area to the east and north of the Verizon Center, with a number of office buildings (including the U.S. General Accountability Office) and large apartment buildings. This area bridges between the Penn Quarter and NoMa. Capital Crossing, a 2.2 million sq. ft. five-building development, is under construction now and slated to be completed by 2022 on the eastern edge of this area; it's not clear whether this load would be served by the SW Network Group, radial service from #212, or a different substation altogether. Figure 5 shows the approximate route of the wires in the SW Network Group in red.[20]

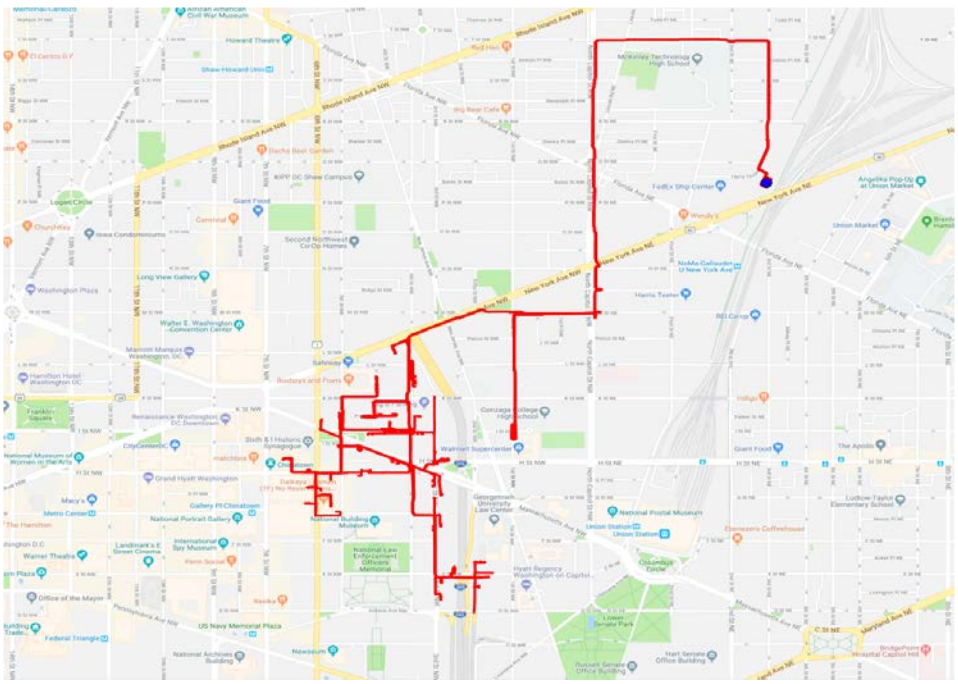
The U.S. General Accountability Office is supplied by the New Jersey Ave. Sub. 161 West High Voltage Feeder Group not the Northeast Sub. 212 Southwest LVAC Network Feeder Group. In addition, while the Capitol Crossing building with an address of 250 Massachusetts Ave., NW will be supplied by the Northeast Sub. 212 Southwest LVAC Network Feeder Group, all other

[19] Synapse Study at 7.
[20] *Id.*

buildings on the Capitol Crossing property will be supplied by New Jersey Ave. Sub. 161 South LVAC Network Feeder Group.

Moreover, the Synapse Study's Figure 5 does not represent the area covered by the Northeast Sub. 212 Southwest LVAC Network Feeder Group.[21] Instead, Figure 5 below shows an accurate depiction of the area covered by the Northeast Sub. 212 Southwest LVAC Network Feeder Group.[22]

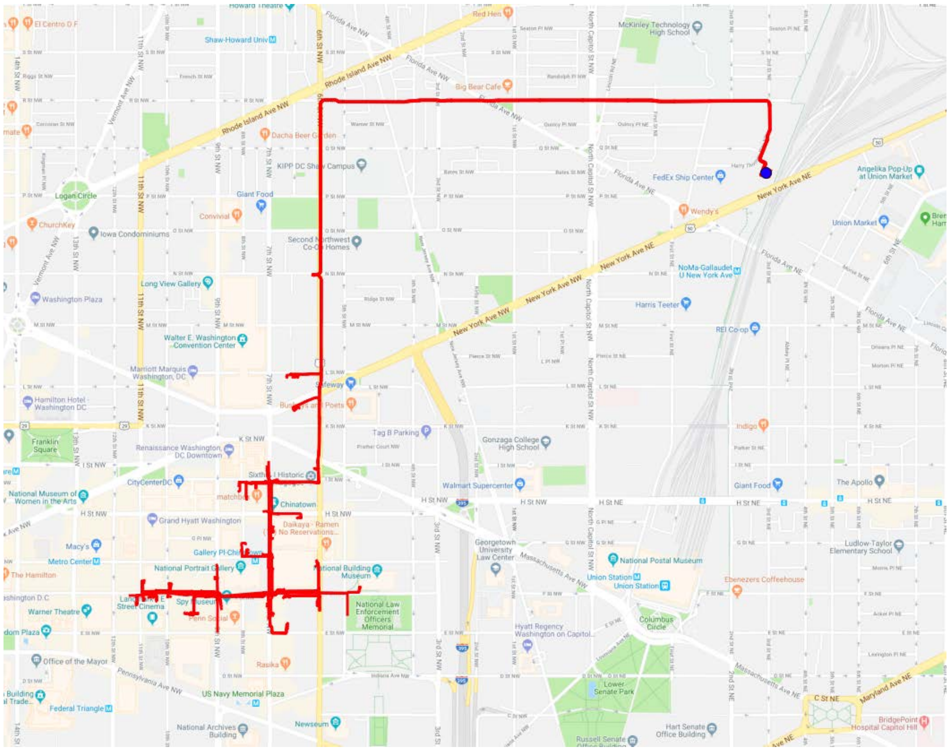
Figure 5



Furthermore, the Synapse Study's Figure 6 represents an inaccurate understanding of the Northeast Sub. 212 West Network Feeder Group.[23] Figure 6 below provides an accurate depiction of the Northeast Substation 212 West Network Feeder Group.[24]

21 Synapse Study at 8.
22 A larger version of the map is included in Attachment B.
23 Synapse Study at 10.
24 A larger version of the map is included in Attachment B.

Figure 6



The Synapse Study misidentifies the supply for the NoMa area as the "#212 radial network."[25] Instead, the NoMa area is supplied by the Northeast Sub. 212 Southeast LVAC Network Feeder Group and Northeast Sub. 212 South Spot Network Feeder Group.

The Synapse Study has not identified the significant expected load growth attributable to the Union Market Development that is currently underway and estimated to have a load of 19 MW by 2023 (with an additional 1.4 MW in 2024) and the potential development of the air rights over the train tracks near Union Station (Burnham Place) with a total load expectation of approximately 15 MW. The list of large buildings in the Synapse Study's Table 3 are not nor will be served by the radial feeders.[26] Instead, these buildings will be supplied by either the Northeast Sub. 212 Southeast LVAC or South Spot Network Feeder Groups. Finally, the

---

25 Synapse Study at 11.

26 *Id.* at 12.

Synapse Study contends that "[n]o major buildings have been constructed in this area since 2009, although a few building permits have been granted, presumably for renovations or other work."[27] As Attachment A makes clear, significant development has been and continues to be undertaken in the area since 2009.

In sum, the Synapse Study bases its analysis and conclusions about potential deferral solutions on a flawed understanding of the distribution system that would be impacted by its recommendations. As a result, the Synapse Study's proposed alternatives to the Mt. Vernon Substation are not tailored to the realities of the system and would leave electric distribution customers at undue risk.

2. The Synapse Study's Assessments of the Potential for Peak Load Reductions from Demand Response Ignore Risks and Are Unsupported.

The Synapse Study relies heavily on demand-side measures in its purported alternatives to the Mt. Vernon Substation. Demand-side measures include all customer actions that take place on the customer side of Pepco's electricity meters. One such demand-side measure upon which the Synapse Study relies heavily is demand response. The Synapse Study projects that the existing buildings on the Northeast Sub. 212 Southwest LVAC Network Feeder Group could provide 4.4 MW of demand response[28] and contends that more than 8.3 MW of additional demand response from new buildings could be expected if Pepco's load forecast for unknown future buildings is correct.[29] However, in developing these estimates, and when developing potential demand response adoption patterns that are founded on this alleged potential,[30] the

[27] Synapse Study at 18, para. 3.6
[28] *Id.* at 40.
[29] *Id.* at 40-41.
[30] *Id.* at 48-52.

Synapse Study ignores realities about the timing, management, and other limitations of implementing demand response measures in the District of Columbia. Further, even putting these realities aside, a deeper look at the Synapse Study's own evidence used to support its estimates of potential savings shows that this evidence does not support these estimates. The reliability of the electric service of thousands of District of Columbia Customers should not be put at risk based on unsupported assumptions about demand reductions that might be achieved.

Real-World Limitations on Demand Response

The Synapse Study has failed to consider real-world timing, management, and other limitations that must be factored into any solution that is purporting to provide safe and reliable service to the District of Columbia.

Customer participation in demand response programs is voluntary in the District of Columbia and is largely dependent on several factors including economics, convenience, and altruistic motivations. Customers choose which measures to install and manage. To be most effective, demand response would need to be accompanied by the appropriate incentives, such as those provided through dynamic pricing program. There is currently no dynamic pricing in the District of Columbia, and Pepco currently is not allowed to expand its residential Direct Load Control ("DLC") program.[31] A successful deferral through demand response would require the time to (1) get dynamic pricing approved to provide the proper incentives to voluntarily join the program and ramp up adoption and (2) receive approval to expand the DLC program, have the ability to target the area that Mt. Vernon Substation would serve, and recruit new participants from that area to the program. In its various conceptions of multiple megawatts of demand

[31] At this time Pepco operates a residential direct load control program in the District of Columbia that reduces residential air conditioning demand by cycling residential central air conditioners or residential central heat pump compressors by an installed smart thermostat or outdoor cycling switch.

response being achieved over just a few years,[32] the Synapse Study fails to explain how, in the absence of these critical programs or program expansions, this demand response can be achieved and how Pepco can rely on it being achieved as a system reliability solution.

Further undermining the assumption that demand response benefits will immediately materialize is the fact that Pepco must receive Commission approval before it implements or expands demand response programs, a process that can be lengthy and must be initiated several years in advance of when load reduction capability is needed. By way of example, Pepco sought approval of its existing residential DLC program through a filing made initially on March 3, 2009 (Formal Case No. 1070) and subsequently denied on January 20, 2010. Pepco submitted an updated proposal on June 15, 2011 (Formal Case No. 1086) that was approved by the Commission on November 3, 2011.[33] The approval order required an educational plan to be filed with the Commission within 30 days prior to the program implementation. The education plan was approved on March 2, 2012.[34]

The timing involved in regulatory approval is particularly relevant because the Synapse Study relies on a residential dynamic pricing program in Worcester, Massachusetts to support its deferral alternatives. The study's reliance on the results of a dynamic pricing program in Massachusetts ignores the fact that there is currently no dynamic pricing program in the District of Columbia. Pepco has previously proposed two dynamic pricing programs in the District of Columbia, both of which were rejected after lengthy regulatory proceedings. The history of dynamic pricing proposals in the District of Columbia and the length of time it took to obtain approval, implement and fully ramp up the DLC program undermines the notion that a dynamic

32 Synapse Study at 48-52.
33 Order No. 16602 at 18.
34 Order No. 16720 at 10.

pricing program will be available in a timeframe or at a level that could be relied upon in lieu of a substation to ensure reliable electric service for customers in the District of Columbia.

Even after Pepco gains regulatory approval to implement a new program—in the case of dynamic pricing—or expand a program—in the case of the DLC program, it takes time to implement the program and to recruit participants to the program. For example, in the case of the DLC program, the Company immediately began to implement the program, select and enter into vendor contracts, design marketing materials and campaigns, make billing system modifications, train staff, and recruit participants. Load reduction capability began during the summer of 2013, approximately 1.5 years after Commission approval. The full program buildout was achieved by the summer of 2015, two years after implementation.

Moreover, customers who participate in any demand response program or activities in the District of Columbia do so voluntarily. Participants may drop out of demand response programs or opt to participate or not in demand response activities at any time. The more frequent the demand response reductions are activated, the greater the inconvenience experienced by customers, resulting in higher program attrition. Therefore, during periods when reductions are needed over numerous hours and days to shave peak load, reduction capability may be more limited.

To the extent that third parties are running demand response programs, Pepco has no authority to activate them. Therefore, these programs or initiatives may not be available during times of electricity supply constraints and cannot be relied upon to defer a substation. Moreover, the Commission would have to approve and fund any contractual relationships with third-party curtailment service providers.[35]

Finally, Pepco is concerned about putting the District of Columbia in a situation in which a timely solution (the Mt. Vernon Substation) to satisfy the system needs is rejected in favor of a solution that would require a subset of customers to adopt a time-of-use rate structure and demand response program whether or not they want that type of service. By building the Mt. Vernon Substation, this type of customer fairness issue can be avoided.

Specific Issues Regarding Non-Residential Demand Response Programs

Non-residential customer demand response programs in the District of Columbia are offered by competitive third-party curtailment service providers or by customers who participate directly in the PJM wholesale demand response market. The total estimated peak demand reduction capability of the program is approximately 168 MW, or approximately 0.8% of the Pepco District of Columbia capacity obligation for PJM Delivery Year 2017/2018. Approximately 1.5 MW, or 0.9%, of this reduction capability is currently located in the area that will be served by Mt. Vernon Substation, which is a heavily commercial load-dominated area. However, Pepco has no control over any of these load reductions, therefore the reductions may not be available when needed to shave the peak load.

Non-residential load reduction capability would be a necessary component of any demand response alternative to the Mt. Vernon Substation. According to PJM data, approximately 78 MW of third-party non-residential demand response existed in the District of Columbia during the PJM 2017/2018 Delivery Year. The total number of non-residential participants was 329, who provided an average reduction capability of 237 kW each. This

[35] The Company has previously established contracts with third-party curtailment service providers in Maryland for Pepco and its affiliate Delmarva Power with mixed success. Maryland Public Service Commission Case No. 9149. Also, Pepco's utility affiliate, Atlantic City Electric Company, established similar contracts in New Jersey.

capability represented approximately 3.5% of the total capacity obligation of the District of Columbia for the delivery year.

Finally, recent changes to the PJM capacity market require that capacity resources provide capacity throughout the entire calendar year to help ensure adequate electricity supply reliability. This limits the wholesale market revenue available to support utility or third-party demand response programs.

The Synapse Study's Demand Response Assumptions Are Not Supported by the Study's Own Evidence

Even if all of the real-world limitations of demand response in the District of Columbia could somehow instantly be overcome, a deeper look at the Synapse Study's own evidence used to support its estimates of the potential peak demand reductions that could be achieved from demand response reveals that it does not support the study's estimates.

To further understand how the Synapse Study's own evidence does not support its assumptions about potential peak demand reductions from demand response, the two categories of the Synapse Study's postulated demand response potential—large commercial buildings (Mt. Vernon large commercial DR program) and multifamily buildings (Mt. Vernon multifamily DR program)[36]—must be addressed separately.

With regard to demand response from large commercial buildings, the Synapse Study assumes that 50% of the large commercial buildings participate in demand response programs and that each of these participating buildings is able to reduce its peak demand by 58%-64%.[37] The study further assumes that this roughly 60% peak demand reduction per participating

[36] Synapse Study at 36-37.
[37] *Id.* at 40. See also the Synapse workpaper, "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

building is achieved if an incentive payment of $150/kW-year is offered.[38] The Synapse Study supports this assumption by referencing elasticity values from results of demand response programs in California, presented in a study for the Pennsylvania Public Utility Commission.[39]

While the Synapse Study claims that this data supports its assumption of roughly 60% peak demand reductions for participating customers, close inspection of the report it references reveals that no such support exists. The California data used in the Pennsylvania report pertained to much lower incentive payments and resultant peak demand reductions and does not provide any empirical evidence of peak demand reductions anywhere close to the 58%-64% values that the Synapse Study asserts could be achieved. Specifically, the payment ranges used to calculate the elasticities in the Pennsylvania report ranged from $4.50/kW-year to $79.17/kW-year, implying resultant peak demand reductions of roughly 1% to 30%, nowhere close to the 58%-64% peak demand reductions assumed by the Synapse Study.[40]

The Synapse Study further attempts to justify its forecasted peak demand savings from large commercial demand response by stating that Orange & Rockland Utilities, Inc. ("O&R") achieved roughly 60% peak demand reductions from a large commercial demand response program in 2016.[41] While this may be true, the O&R report on this program indicates that the participation rate was less than 10%,[42] nowhere close to the 50% participation rate that the

[39] *Id.*, which references "Demand Response Potential for Pennsylvania," GDS Associates, Inc., February 25, 2015. See also page 73 of this referenced study, which explains that its elasticity estimates are based on data for non-residential demand response programs in California.

[40] "Demand Response Potential for Pennsylvania," GDS Associates, Inc., February 25, 2015, pp. 73-75. The Synapse Study applies the elasticities for "Day-Ahead" and "Day-Of" demand response products.

[41] Synapse Study at 40.

[42] See "Orange & Rockland Utilities, Inc. Annual Report on Program Performance and Cost Effectiveness of Dynamic Load Management Programs," December 1, 2016. An 8.7 MW peak demand reduction was achieved via the Commercial System Relief Program (p. 10), and an 18.9 MW peak demand reduction was achieved via the Distribution Load Relief Program (p. 16), for a total peak demand reduction of 27.6 MW. In comparison, average monthly peak demands (which would be lower than annual peak demands) are an order of magnitude higher. For example, Exhibit_EFP-1, Schedule 4, Page 2 of 5 of "electric-filing-exhibits-volume-1" from O&R's "2018 Electric

Synapse Study asserts Pepco can rely on achieving with a 60% average peak demand reduction from participating customers. Rather than supporting the Synapse Study's assumptions regarding the potential for demand response savings from commercial buildings, the O&R report indicates that those assumptions are highly inflated.

The Synapse Study's forecasted peak demand reductions for multifamily buildings are similarly unsupported by the evidence that the study presents. Specifically, the Synapse Study's recommendation to defer the construction of the Mt. Vernon Substation is based in part on the potential for peak demand reductions from its envisioned "Multifamily DR program," which is a largely unspecified plan to pursue demand response measures for the multifamily buildings on the Northeast Sub. 212 Southwest LVAC Network Feeder Group.[43] The study assumes that 70% of the customers residing in multifamily buildings on the Northeast Sub. 212 Southwest LVAC Network Feeder Group will reduce their peak demands by 25% on average,[44] "mainly based on the performance of the residential demand response pilot program implemented by National Grid in Massachusetts, along with data for a few other pilot programs."[45] However, the Synapse Study's assumptions for the Northeast Sub. 212 Southwest LVAC Network Feeder Group are not consistent with the National Grid pilot program's results, and the results of the "few other pilot programs" similarly do not support the Synapse Study's assumptions.

First, the National Grid pilot program was able to achieve a high customer participation rate, consistent with the Synapse Study's 70% participation rate assumption for the Northeast Sub. 212 Southwest LVAC Network Feeder Group, only because it was an opt-out dynamic rate

---

Rate Case Filing," found at https://www.oru.com/en/ny-rates-tariffs, shows that average monthly peak demand for non-residential is 6,700/12=558 MW, while as another point of comparison the average monthly peak demand for just Total Primary is 2,711/12=226 MW.

43 Synapse Study at 37.

44 *Id.*

45 *Id.* at 38.

pilot program. The National Grid pilot program entailed installing an AMI meter and providing the necessary price signals for demand reduction by imposing dynamic pricing rates[46] on every customer in the pilot area unless the customer affirmatively opted out of the program.[47] To reach the 70% participation rate assumed by the Synapse Study in the District of Columbia, Pepco would have to impose upon customers a similar opt-out dynamic pricing structure. Evidence from the National Grid pilot program's "Final Evaluation Report,"[48] upon which the Synapse Study relies for its 70% customer participation assumption, supports the inability to achieve a customer participation rate anywhere close to 70% without this opt-out feature. The National Grid report samples 19 different opt-in dynamic rate pilot programs, and the customer participation rates for those opt-in programs are only between 5% and 40%.[49] While the Synapse Study's assumed customer participation rate, therefore, is clearly dependent upon an opt-out demand response program and the associated necessary dynamic pricing structure, no such structure is currently in place in the District of Columbia, and Pepco cannot unilaterally impose such a structure on customers. Instead, Pepco would have to create such a program and propose it to the Commission for approval.

Second, even if an opt-out demand response program were imposed on all multifamily buildings on the Northeast Sub. 212 Southwest LVAC Network Feeder Group, the Synapse Study's assumption of an average 25% peak demand reduction per participating customer is far higher than the levels achieved in the National Grid pilot program. In the first year of the

46 Customers who did not affirmatively opt out of the program were placed on a "Critical Peak Pricing" rate, which is a combination of a time-of-use rate with critical peak pricing, unless they proactively selected a "Peak Time Rebate" rate.

47 "National Grid Smart Energy Solutions Pilot – Final Evaluation Report," Navigant, May 5, 2017, at 2-4.

48 *Id.*

49 *Id.* at 95.

National Grid pilot program, the total demand savings was only 3.9% for all residential[50] participants averaged across the 20 announced "Peak Events" of each summer.[51] In the second year, it was only 7.2%.[52]

The Synapse Study overlooks these facts and instead focuses on the peak demand reductions of a very small percentage of participating customers in the National Grid pilot program to support its 25% average peak demand reduction assumption, stating that

> [t]he participants with the advanced thermostats under Level 3 and Level 4 technology packages both reduced a similar level of peak load ranging from about 22 percent to 30 percent peak load…An evaluation study of National Grid's pilot program also reviewed peak load impacts from other programs. It found a similar level of impacts from demand response programs that offered Wi-Fi enabled thermostats, ranging from 25 percent to 35 percent average peak load reductions. Thus, we assumed a 25 percent reduction for our study.[53]

The Synapse Study is correct that the participants in the National Grid pilot program with the most advanced technology packages were able to reduce their peak demands by 22% to 30%. However, less than 3% of the customers in this pilot program elected to have these technology packages installed at their premises,[54] despite the fact that these technology packages were offered for free[55] and despite "heavy promotion of the technologies."[56] The overwhelming majority of the customers who participated in the pilot program had much lower peak demand reductions. The reductions were low despite the fact that participants were provided a web portal

[56] *Id*. at 93.

that produced information about their personal electric use,[57] and they received notifications prior to days with expected high demands in which they were afforded opportunities to save extraordinary amounts of money by reducing their demands.[58]

In addition, the level of activity and the peak demand reduction percentages in the pilot program were even lower for renters than for customers in general.[59] Because there are existing and new apartment complexes on the Northeast Sub. 212 Southwest LVAC Network Feeder Group, this could also have an impact on the reductions realized under the Synapse Study's proposed alternatives.[60] As noted in the "Final Evaluation Report" for the National Grid pilot program, "[t]he lower savings for renters as compared to other customers likely stems from the particular challenges renters face in conserving electricity. For example, renters may or may not pay their own electric bill and they often have to get landlord permission for many conservation activities (such as buying new appliances)."[61]

The Synapse Study's 25% demand reduction assumption also is not supported by the "data for a few other pilot programs."[62] In referencing those other pilot programs, the study states that "[the 'Final Evaluation Report' for the National Grid pilot program] found a similar level of impacts from demand response programs that offered Wi-Fi enabled thermostats, ranging from 25 percent to 35 percent average peak load reductions."[63] However, that report only addresses peak demand savings levels achieved in other programs for the set of customers who have adopted advanced technologies and/or are the most active in managing their

63 *Id.* at 38

demands.[64] The peak demand savings levels for other, less active customers are not addressed. Consequently, the Synapse Study's references to these other programs does not support its assumption that 70% of the customers residing in multifamily buildings in the Northeast Sub. 212 Southwest Network Feeder Group will reduce their peak demands by 25% on average.

The Synapse Study's conclusions regarding the demand reductions achieved from demand response are unsupported and overstated and should be rejected.

3. *The Synapse Study's Assessment of the Potential for Peak Load Reductions from Energy Efficiency Contains Significant Flaws that Cast Serious Doubt about the Synapse Study's Conclusions.*

The Synapse Study also relies heavily on energy efficiency measures as a critical part of its purported alternatives to the Mt. Vernon Substation.[65] To develop its demand reduction estimates from energy efficiency, the Synapse Study uses a bottom-up approach. The study first identifies the peak loads of the existing buildings and the projections for new buildings in the Northeast Sub. 212 Southwest LVAC Network Feeder Group. It then classifies these buildings, as "mixed-use," "office," "hotel," or "multifamily"[66] and applies a mix of end uses (*e.g.*, cooling, lighting, refrigeration, electronics) for each building classification.[67] As the final step to determine the estimated peak demand response reduction that could be achieved from energy efficiency, the Synapse Study applies the average percentage reductions from energy efficiency measures depicted in a 2015 Pennsylvania energy efficiency study ("Pennsylvania Study") to all of the buildings the Synapse Study assumes to be served by the Northeast Sub. 212 Southwest

[64] "National Grid Smart Energy Solutions Pilot – Final Evaluation Report," Navigant, May 5, 2017, pp. 10-11, 60-61, 125.

[66] Synapse Study at 22, 29.
[67] *Id.* at 22-23.

Network Feeder Group.[68] This methodology results in the Synapse Study's estimates for potential peak demand reductions from energy efficiency of 3.4 MW from existing buildings and another 3.4 MW from new buildings.[69]

As is the case with the Synapse Study's estimates of the potential for peak demand reduction from demand response, the Synapse Study's assessment of the viability of energy efficiency contains significant flaws that invalidate its estimates of the potential for energy efficiency to satisfy the distribution system need. In developing its estimates of the potential for peak demand from energy efficiency, the Synapse Study ignores realities about the management, participation, and other limitations of implementing energy efficiency measures. Further, even putting these realities aside, a deeper look at the Synapse Study's analysis to support its estimates shows that these estimates have no validity. Significantly, the Synapse Study shows a fundamental misunderstanding of Pepco's planning process that severely undermines its energy efficiency demand reduction assumptions. The reliability of the electric services of thousands of District of Columbia Customers should not be put at risk based on an unsubstantiated hope that inadequately supported and inflated assumptions about demand reductions that could be achieved through energy efficiency.

<u>Real-World Limitations on Energy Efficiency</u>

Energy efficiency and conservation programs in the District of Columbia are currently provided by the District of Columbia Sustainable Energy Utility ("SEU"). Pepco is a member of the oversight board of the SEU but has no ability to control the types of energy efficiency and

---

[68] Synapse Study at 25. See also Synapse workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

[69] *Id.* at 28-29. This source shows an estimate of 3.3 MW from existing buildings, but the Synapse workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco), shows an estimated value of 3.4 MW.

conservation programs established, reduction targets, and/or geographic reduction targets. This eliminates Pepco's ability to directly reduce load within the geographic area that will be served by the new Mt. Vernon Substation.

Furthermore, customer participation in energy efficiency and conservation programs is voluntary. Customers choose which measures to install and manage. Customer participation is largely dependent on several factors including economics, convenience, and altruistic motivations, and the Synapse Study ignores important considerations along these lines.

Voluntary energy efficiency programs will require multiple years to recruit sufficient participation. Any new energy efficiency and conservation program implementation typically requires considerable time before any significant energy and demand savings can be achieved. For example, Pepco filed for approval of new District of Columbia energy efficiency and conservation programs on April 4, 2007 in Formal Case No. 1056. The Commission approved several of Pepco's program proposals on December 18, 2008 through Order No. 1539 in Formal Case No. 945 but required Pepco to submit of a work plan prior to program implementation. On March 12, 2009, through Order No. 15219, the Commission approved the Company's work plan and permitted program implementation to commence. Pepco subsequently launched its residential energy efficiency and conservation programs during July 2009 and its non-residential programs during August 2009. The total required time for program implementation of these programs was 27 months. After one year of program operation, the Pepco programs provided 18,600 MWh of annual energy savings and 2.6 MW of peak demand reductions throughout the District of Columbia.[70]

[70] Note that on June 15, 2010 the City Council reallocated available funding from the Sustainable Energy Trust Fund to other governmental programs and, therefore, the funding for Pepco's energy efficiency programs ceased on September 30, 2010.

Pepco has significant experience with the implementation of energy efficiency and conservation programs in the District of Columbia, and it currently offers numerous programs in Maryland. Critical program elements include: design, staffing, implementation, marketing, and evaluation. Any energy efficiency programs targeted at reducing electric energy and demand in the area of the District served by the Mt. Vernon Substation would require a minimum lead time of 12 to 24 months after program approval prior to providing meaningful electricity savings that would need to be evaluated and verified.

In Pepco's experience implementing energy efficiency projects in Maryland through the EmPOWER Maryland program, the average total building lighting retrofit project for an office building or condominium building similar to those identified in the Synapse Study, full retrofit projects for similar facilities take 6-8 months from application pre-approval to final commissioning. The 6-8 months does not include the significant engineering analysis and planning that takes place prior to an application being approved. The time required calls into question the feasibility of the time frame the Synapse Study believes peak load savings will be realized. At no point in its analysis does the Synapse Study address the average length of a project or the circumstances that impact when a facility could be accessed and/or upgraded. Furthermore, after one year of operation with a full suite of energy efficiency and renewables programs, the DC SEU was able to achieve only 24,000 MWh of annual savings and 3.6 MW of peak demand savings throughout the entire District of Columbia system.

<u>The Synapse Study's Energy Efficiency Assertions Are Not Supported by Its Own Evidence</u>

Even if all of the real-world limitations of energy efficiency implementation could be instantly overcome, a deeper look at the Synapse Study's analysis to support its estimates of the potential for energy efficiency shows that these estimates have no validity, resulting in grossly overstated estimates of any such potential. Most significant among the flawed assumptions is that there is abundant potential for energy efficiency measures in new buildings. Pepco's peak load forecast already assumes that new buildings have energy efficiency measures incorporated into the designs, meaning that these buildings already are assumed to undertake substantial energy efficiency and conservation efforts. That the energy efficiency gains are already incorporated into the load forecasts negates any non-negligible additional potential for energy efficiency to reduce peak demands.[71] This effectively invalidates the Synapse Study's estimate of 3.4 MW of demand reduction from additional energy efficiency measures in new buildings for the area served by the Mt. Vernon Substation.

Similarly, the Synapse Study overlooks the fact that five of the existing buildings in the Northeast Sub. 212 Southwest LVAC Network Feeder Group are already LEED-certified, as well as an additional two buildings that Synapse identifies in the study that would not be served by the feeder group: 425 Eye, 700 6th St NW, 455 Massachusetts Ave, 777 6th St NW, 132- Hampton Inn, T43- Jackson Graham Building (not in area), and the National Building Museum (not in area). Accounting for this fact alone reduces the Synapse Study's estimate for incremental peak demand reductions from energy efficiency in existing buildings from 3.4 MW to 2.4 MW. Furthermore, one other building, Madrigal Lofts, already has LED lighting installed in its common spaces, which further reduces the potential for incremental peak demand reductions from energy efficiency. Additionally, there are two other buildings that are not LEED certified but are not included in the Northeast Sub. 212 Southwest LVAC Network Feeder Group: the GAO building and Gallery Place. Removing these two irrelevant buildings further

[71] Research conducted by the New Buildings Institute (NBI) concluded that LEED buildings in the United States generally save 25 to 30 percent energy usage over conventional buildings.

reduces the MW savings from EE according to the Synapse Study's model to less than 1 MW of demand reduction potential from energy efficiency.

The flaws in the Synapse Study's analysis of the potential for peak demand reductions from energy efficiency in existing buildings are not just limited to the fact that the Synapse Study ignores that the potential for incremental reductions is heavily mitigated by the reality that many buildings already have taken advantage of energy efficiency measures. The Synapse Study also overstates the savings potential from each existing building that has not yet installed significant energy efficiency measures. In creating a general estimate of peak demand savings from energy efficiency programs in existing buildings, the Synapse Study assumes that all of the existing buildings implement retrofit measures and half of the existing buildings implement replace on burnout ("ROB") measures.[72] However, in any energy efficiency project, each measure installed will be *either* a ROB measure or a retrofit measure. No measure will ever be both ROB *and* retrofit. Consequently, the Synapse Study significantly overestimates the potential for peak demand savings from any given existing building.

Moreover, the Synapse Study's estimates of potential peak demand reductions from energy efficiency in existing multifamily buildings may be particularly overstated. Specifically, in the calculation of peak savings from retrofit projects for lighting in multifamily buildings, the Synapse Study uses peak savings estimates for ROB lighting projects in multifamily buildings because it does not have data for peak savings estimates for retrofit lighting projects in multifamily buildings.[73] In offices and hotels, ROB lighting projects have higher peak savings,

---

[72] Synapse Study at 26. *See also* Synapse Study workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

[73] Synapse Study workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

on average, than retrofit lighting projects; thus, to the extent that this relationship also applies for multifamily buildings, the Synapse Study's substitution of ROB data for retrofit data likely results in overestimated multifamily lighting savings.

The Synapse Study also does not distinguish owner-occupied multifamily condominium properties from renter-occupied multifamily properties, an important distinction for achieving any level of peak demand savings from voluntary energy efficiency. While the end-use load profiles for these two types of buildings are likely similar, access to individual units requires individual owner consent for owner-occupied buildings whereas access to individual dwelling units in rental properties can be negotiated with the property management company. Assuming the savings identified in the six multifamily buildings is whole building (not just common area retrofits), this calls into question the actual feasible savings potential in a timely manner from a practical implementation perspective.

In addition, the Synapse Study uses the most optimistic assumptions regarding the percentage of lighting in building end use. The Synapse Study presents two sources that provide end-use consumption breakdowns, Greenlink and CBECS/EIA NEMS Building Data.[74] For its lighting percentages, the study uses Greenlink as its source, which estimates that lighting represents higher percentages of building end use. Since lighting provides the greatest opportunity for peak demand reduction savings, the Synapse Study's treatment may result in a high estimate of potential savings. Finally, for both retrofit and ROB projects, to develop its peak savings estimates from lighting, cooling, and refrigeration (but not electronics) in multifamily buildings, the Synapse Study averages multifamily and hotel peak savings data

---

[74] Synapse Study at 22, referencing "The Potential for Demand-Side Resources in the District of Columbia," Greenlink, October 5, 2016 and "Annual Energy Outlook 2015," EIA, April 2015. See also Synapse workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

applicable to PECO.[75] The study purports to include hotel data to account for savings associated with common areas in multifamily buildings (*e.g.*, office, laundry, swimming pool, fitness room). However, this treatment is not adequately justified, and it has the effect of raising the Synapse Study's savings estimates for multifamily buildings.

Moreover, the Synapse Study bases its peak demand savings and cost estimates on very limited data about actual energy efficiency measures, calling into question the reliability of these estimates. For each combination of building type (mixed-use, office, hotel, or multifamily), end-use (cooling, lighting, refrigeration, or electronics), and project type (retrofit, ROB, or new construction), the Synapse Study computes average peak savings and costs (in $/kW) of energy efficiency measures based on data from a 2015 GDS energy efficiency potential study for Pennsylvania.[76] In particular, the Synapse Study examines only project savings and cost data corresponding to PECO, as the study contends that PECO's customer characteristics are more comparable than other utilities in Pennsylvania because PECO covers a metropolitan area similar to the District of Columbia.[77] For many combinations of building type, end-use, and project type (*e.g.*, office, cooling, ROB), there are only a few comparable, cost-effective measures in PECO from the GDS EE potential study for Pennsylvania.[78] Moreover, measures examined in the GDS study vary drastically in size and scope, so the Synapse Study's simple averages of percent savings and $/kW costs may be skewed.

75 Synapse Study workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

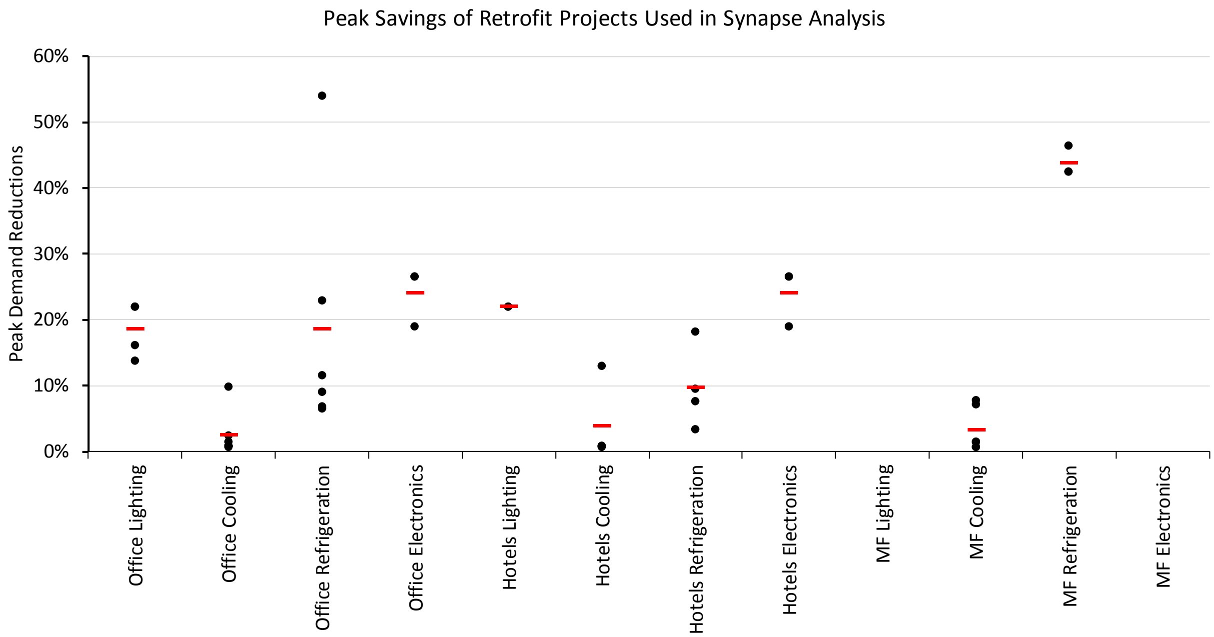
Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

77 *Id.* at 25-26.

78 Synapse Study workpaper "J. Mt. Vernon Buildings NWA Analysis.xlsx" provided as part of the District of Columbia Government's (DCG) Responses to the First Set of Data Requests from the Potomac Electric Power Company (Pepco).

Figure 7 depicts the wide range of peak demand reductions achieved by various retrofit measures, using the data from the 2015 GDS energy efficiency potential study for Pennsylvania. In the figure, each black dot represents a different energy efficiency measure, and the dots in a given column show the distribution of peak demand reductions from that type of measure. Figure 7 provides two insights. First, the Synapse Study bases its estimates on very little data. Second, there is wide variability in the percentage demand reductions achieved by a particular type of energy efficiency measure. As the orange markers on Figure 7 indicate, the Synapse Study simply assumes that, for a given type of energy efficiency measure, any measure of that type would achieve a percentage demand reduction equal to the average percentage demand reduction across the distribution of the points represented by the empirical data. As the black dots show, however, there are relatively few data points for any given type of energy efficiency measure, and the savings distribution across the points is often quite wide. By ignoring this uncertainty about the peak demand reductions from energy efficiency, the Synapse Study does not adequately represent the risks associated with its recommendation to rely on energy efficiency programs to satisfy distribution system needs.

Figure 7



Furthermore, all of this data reflects peak demand reductions from energy efficiency measures in Philadelphia rather than the District of Columbia. Energy savings data specific to the District of Columbia are inherently more accurate than data from Philadelphia due to a variety of factors that include: building characteristic (size, age, etc.), weather conditions, commercial activities, demographics, and regional codes and standards. Table 5 provides a comparison of some key factors for Philadelphia versus the District of Columbia. Because the DCSEU is part of DOEE, the Synapse Study should have ample access to District of Columbia energy efficiency and conservation program savings estimates and should have used District of Columbia data as the basis to forecast saving estimates in the District of Columbia.[79]

[79] Pepco also has detailed energy efficiency and conservation savings estimates from its existing programs in Maryland.

Table 5

Factors	**Philadelphia**	**District of Columbia**
Weather Conditions[80]	HDD: 3,064 CDD: 2,226	HDD: 2,380 CDD: 2,763
Average Height of Highest 5 Buildings	860 Feet	242 Feet
City Population	1,567,872	681,170

Given the uncertainty surrounding the Synapse Study's claimed potential peak demand reductions from energy efficiency, it is not surprising that the Synapse Study's estimates of the peak demand reduction per building are not supported by Pepco's experience with energy efficiency initiatives. Specifically, a study of Pepco Maryland's applicable EmPOWER programs shows that the demand reductions achieved per building are much lower than the Synapse Study assumes. The applicable EmPOWER programs had 573 participants in 2017, resulting in an aggregate peak demand reduction of 8.37 MW. The average project in these programs reduced peak load by 14 kW (with approximately 90% of the savings from lighting retrofits), a value less than one tenth of the 203 kW per building peak demand reduction assumed by the Synapse Study for the Northeast Sub. 212 Southwest LVAC Network Feeder Group. Furthermore, the applicable EmPOWER participants each were large buildings, as none of these buildings had a peak load of less than 100 kW. While the applicable EmPOWER buildings are not an exact proxy for the buildings in the Northeast Sub. 212 Southwest LVAC Network Feeder Group, the large gap between actual demand reductions demonstrated in the EmPOWER results and the Synapse Study's assumed demand reductions casts further doubt on the demand reductions that the study hopes that Pepco could achieve.

80 2017 weather data sources from Weather Data Depot.

Table 6 shows a representative sample of average completed jobs in Pepco Maryland prescriptive/existing buildings recently. While these are not intended to represent a ceiling of energy efficiency potential, they do show what comprises a typical significant retrofit on large buildings. While these per-job savings are greater than 14kW, in all but one case they are dramatically lower than the 203 kW projection from the Synapse Study.

Table 6

Program Type	Existing Buildings	Existing Buildings	Existing Buildings	Custom	Existing Buildings	Existing Buildings
Project Name	Lighting Fixtures & Controls	Lighting Fixtures & Controls	Lighting Fixtures & Controls	Custom Window Film	Chillers	Lighting Fixtures & Controls
Year Built	2005	1997	1980	2004	unknown	1959

Building Type	R&D Manufacturing & Office	Parking Lot / Parking Garage	Office	Office	Office	Office
Total Timeline (months)	15	7	14	22	21	15
Completion Incentive Total	$55,380	$21,625	$64,990	$42,907	$50,691	$274,580
Completion Savings kW	60	27	42	26	58	197
Completion Savings kWh	299,422	194,447	147,532	153,239	223,573	440,040
Project Information	Installation of 1,017 LED retrofit kits	Installation of 80 LED panels and 40 LED parking area pole fixtures	Installation of 118 PAR & A LED lamps, 654 LED panels, 152 TLED Type C, 17 LED parking lot pole fixtures, PACE Financing	Installation of silver window film on portions of south, east and west exposure glazing	Installation of (2) 700 ton water cooled centrifugal chillers rated at 0.525 kW/ton full load and 0.334 IPLV	Installation of 1,492 LED Panels, 2,915 LED Strip retrofit kits

Finally, designed savings from projects often vary significantly from realized savings. A 2015 study from the Lawrence Berkeley National Laboratory indicated that actual energy usage deviates from planned savings by approximately 20% on average. Variation in actual building performance makes it very difficult to assess energy savings potential. A separate study that investigated the actual performance of designated high performance buildings (HPBs), such as LEED certification in the United States and comparable certifications in Europe and China, found little evidence that proves that specific measure installations actually yield significant realized energy savings. The study "conclude[s] that no single factor determines the actual energy performance of HPBs, and adding multiple efficient technologies does not necessarily improve building energy performance; therefore, an integrated design approach that takes account of climate, technology, occupant behavior, and operations and maintenance practices should be implemented to maximize energy savings in HPBs." The investigators looked at different mixes of technologies installed and factored for size, weather, and other potentially impactful variables, and importantly concluded "that stacking or simply adding more technologies does not lead to low energy use." The HPBs that consistently achieved superior performance had highly integrated design processes that considered the occupants' preferences and the building's unique usage needs, and took into consideration the behavioral components of energy savings.

The Synapse Study's conclusions regarding demand reductions achieved from energy efficiency are unsupported and overstated and should be rejected.

4. *The Synapse Study's Assessment of the Local Rooftop Solar Potential is Highly Problematic.*

The Synapse Study initially estimates a potential of 5 MW of rooftop solar photovoltaic ("PV") generation in the area served by Northeast Substation 212, including a potential for 2 MW of rooftop solar PV generation on buildings on the Northeast Sub. 212 Southwest LVAC Network Feeder Group.[81] To develop this estimate, the Synapse Study applies an assumption that 20% of total rooftop space is available for solar PV systems. The 20% value is calculated based on a study of a sample of non-residential buildings in the District of Columbia that already have installed solar PV systems.[82] The Synapse Study then applies its estimate of 0.125 kW/m^2, as sourced from the International Renewable Energy Agency, for the solar-capacity-to-rooftop-area ratio. The Synapse Study uses the solar-capacity-to-rooftop-area ratio to calculate the 5

[81] Synapse Study at 34.

MW of rooftop solar PV potential in the area served by Northeast Substation, including the 2 MW of rooftop solar PV potential on buildings in the Northeast Sub. 212 Southwest LVAC Network Feeder Group.[83] The Synapse Study notes that historic building and federal ownership issues may complicate deployment in the Northeast Sub. 212 Southwest LVAC Network Feeder Group, resulting in a reduction from 2 MW of solar PV capacity potential to 1 MW of solar PV capacity potential.[84] The study also assumes a 25% peak coincidence factor for solar PV with respect to times of system congestion for which the Mt. Vernon Substation otherwise would be needed.[85] Finally, in its development of portfolios for deferral, the Synapse Study directly includes solar PV only in its portfolio designed to defer the substation construction indefinitely. Here, the Synapse Study assumes that the full 1 MW of solar PV capacity potential in the Northeast Sub. 212 Southwest LVAC Network Feeder Group is utilized, reducing the peak load by 1 MW x 25% = 0.25 MW.[86]

The Synapse Study's assessment is highly problematic. First, the study's assumption that 20% of total rooftop space is available for solar PV systems is based on a small sample size of only 13 buildings and, therefore, is very uncertain.[87] Moreover, the Synapse Study does not derate the solar PV potential for economic viability but, instead, assumes that the entire estimated technical potential is utilized. This is particularly puzzling because Synapse did apply derations to account for economic viability as part of a similar analysis in Synapse's Distributed Solar in the District of Columbia report, to which the Synapse Study refers. The Distributed

Solar in the District of Columbia report assumed an economic deration factor of 26% as its reference case for non-residential buildings.[88] Applying that value to the Synapse Study's final estimate of 1 MW of solar PV potential on the Northeast Sub. 212 Southwest LVAC Network Feeder Group would reduce the estimate to 0.26 MW, a value that is roughly one quarter of amount assumed in the portfolio for the substation deferral. Furthermore, the Distributed Solar in the District of Columbia report indicated that the economic deration factor would decline from 26% to virtually zero if the payback period for a solar PV facility were to extend to 10 years, indicating large uncertainty about the true economic potential and adoption rate.[89] Finally, the 26% value was labeled the "ultimate adoption potential," emphasizing that there is no guarantee that such adoption could be achieved by the time that the Mt. Vernon Substation otherwise would be needed.[90]

There are additional flaws in the study's solar PV analysis. The Synapse Study fails to address the possibility that some buildings already may have solar PV systems, thereby further reducing the solar PV potential. Finally, the study does not account for the fact that solar PV is an intermittent resource that cannot be guaranteed to generate 25% of its maximum output throughout the duration of any period in which it is needed to reduce congestion that otherwise would be remedied by the construction of the Mt. Vernon Substation. The Synapse Study's conclusions regarding solar PV availability are flawed and overstated and should be rejected.

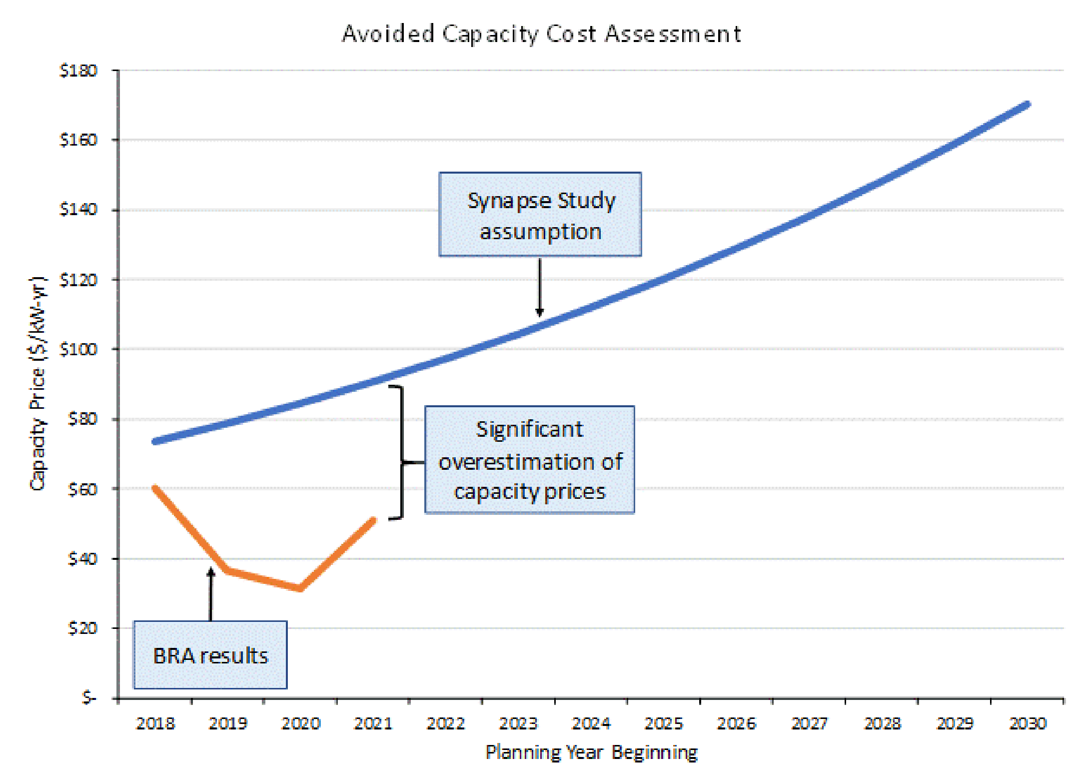
5. *The Synapse Study's Forecasted Avoided Costs of Capacity and Energy from Its Recommended Solutions Are Significantly Overstated.*

The Synapse Study's recommended alternatives are based on implementing projects that would avoid costs of capacity and energy by either reducing electricity demand (*e.g.*, demand response, energy efficiency) or increasing electricity generation (*e.g.*, rooftop solar).[91] Thus, the Synapse Study also relies upon these avoided costs as additional sources of value to justify its proposed alternatives to the Mt. Vernon Substation. However, a simple look at the markets for capacity and energy shows that the Synapse Study's estimates of avoided generation capacity and energy costs are substantially overstated.[92] Specifically, the following figure compares the Synapse Study's "Avoided Generation Capacity ($/kW-yr)" values with actual market clearing prices for generation capacity from PJM's Base Residual Auctions ("BRA"), which establish the actual compensation that resources can be provided for capacity.[93] As Figure 8 shows, the Synapse Study's assumptions for the value of avoided capacity are much higher than actual BRA results.

[91] Synapse Study at 32-33.
[92] *Id.* at 33.
[93] The overwhelming majority of generation capacity in PJM is priced through PJM's Base Residual Auctions.

Figure 8

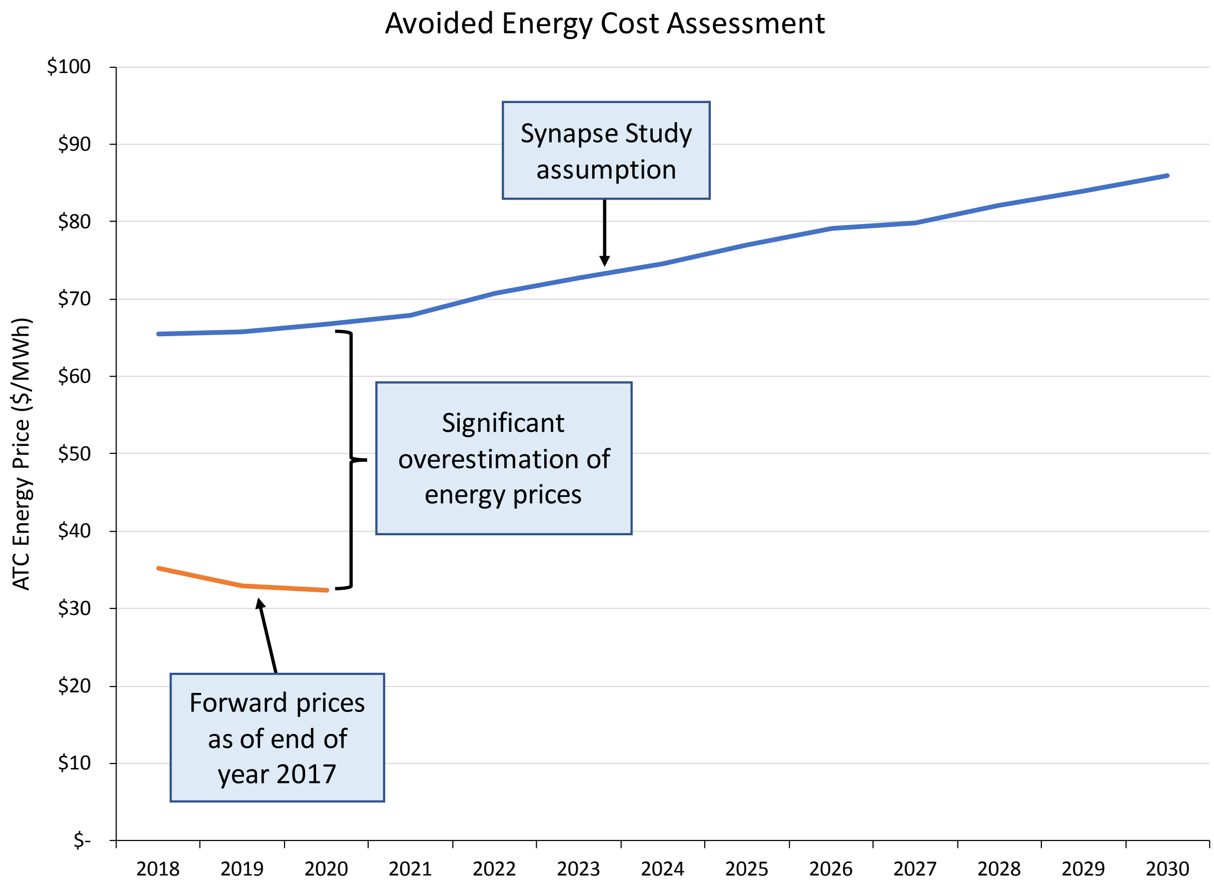


Similarly, as shown in the Figure 9, the Synapse Study's "Avoided Energy ($/MWh)" values are much higher than forward market prices. [94]

---

94 Forward prices reflect NYMEX forward prices for PJM Western Hub as of December 28, 2017, provided by Ventyx / Energy Velocity, plus a locational basis to the PEPCO Zone based on 2017 hourly locational marginal prices provided by Ventyx / Energy Velocity.

Figure 9



The Synapse Study's inflated estimates of the avoided capacity and energy costs paint an overly optimistic picture of the economics of its proposed alternatives to the Mt. Vernon Substation and should be rejected.

6. *The Synapse Study's Calculations of the Present Values of Substation Deferral Overstate the Actual Value to Residents of the District of Columbia.*

Since the Synapse Study's main goal is to defer the construction of the Mt. Vernon Substation, the value of deferring the substation is of critical importance. The deferral value estimate presented in the Synapse Study is derived by comparing the present value of the forecasted revenue requirements paid by customers if the substation is constructed as proposed by Pepco with the revenue requirements if the substation is deferred.[95] Given the time value of money, delaying the costs to customers could have value. However, the Synapse Study has made substantial oversights in performing its calculations, which inflate its estimate of the value of substation deferral. Most notably, a substantial portion of the substation costs that must be covered by customers are the property taxes associated with the substation, which Pepco must pay. The Synapse Study assumes a property tax rate of 5.0% without support for its assumption but with a comment in its supporting workpaper that asks, "What value should we use?"[96] In reality, District of Columbia commercial and industrial real property tax rates are in the range of 1.65%-1.85%,[97] and the personal property rate is generally 3.4%.[98] Lowering the tax rate assumption accordingly would commensurately lower the assumed value of deferring the substation. Furthermore, while these property taxes represent a cost to District of Columbia residents, they also represent a cash inflow to the District of Columbia to provide valuable services to District of Columbia residents. As such, treating property taxes as a cost to residents without recognizing the value that they provide in the form of incremental services to residents inflates the value of substation deferral. Specifically, if the value of the services is treated as a one-for-one value, the present values of substation deferral as calculated by Synapse are reduced by almost 40%.[99] Furthermore, the Synapse Study's analysis of deferral value is based on an erroneous corporate income tax rate of 35%, ignoring the fact that the corporate income tax rate

has been cut to 21% per federal legislation passed in 2017. The Synapse Study's calculations of value are overstated and should be rejected.

7. *The Synapse Study Misrepresents the Load Forecasts.*

The Synapse Study inappropriately compares actual load to Pepco's load forecasts to suggest that Pepco's load forecasts for the impacted substations and feeder groups were flawed. The section in the Synapse Study entitled "Pepco's Load Forecast" shows an understanding of how and why Pepco forecasts load as it does.[100] Nevertheless, the Synapse Study compares the load forecasts to actual load as if the load forecasts were intended to predict the actual load. The comparison is misleading and should be ignored.

To understand why the study's comparisons are misleading, it is important to understand Pepco's planning process. Pepco's methodological planning approach allows the distribution system to handle peak conditions and, thus, enables Pepco to reliably serve customers in the District of Columbia when those conditions occur. The customer demand in the District of Columbia peaks during the summer, and peak customer demand generally is what drives capacity modifications or additions to the distribution system. Accordingly, Pepco uses the year with the highest summer system peak demand in the last ten years for developing a base load for each feeder, substation transformer and substation from which it forecasts future load, which typically corresponds to the highest temperature during non-holiday weekdays over the same period. This 90/10 approach is used to ensure that the distribution system is capable of providing reliable service to District of Columbia customers during the most extreme summer weather likely to be experienced over a ten-year period.

---

[100] Synapse Study at 14.

Complementing Pepco's 90/10 approach is its "bottom-up" method of developing a load forecast: the load is first forecasted at the distribution feeder level, and then the expected load of all the feeders supplied by a given substation in each year of the forecast is summed to determine the corresponding substation peak load for each year of the forecast. Because the load of feeders supplied by a given substation may not peak at the same time (non-coincident feeder peak load), an adjustment to the total of the feeder peak loads in each year of the forecast may be necessary to avoid inflating the expected transformer and substation peak load (feeder coincident peak load). Pepco's load forecasting methodology accounts for expected increases and, where applicable, decreases in future loads, as well as load transfers and other factors that affect the distribution system's capacity. Load forecasts are performed on a short- and long-term basis.

The Synapse Study misuses Pepco's load forecasting data to imply that Pepco's load forecasts are flawed. First, the Synapse Study implies that Pepco's actual loads have not reached the levels projected by Pepco. In Figures 2, 4, and 7, the Synapse Study provides a series of graphs showing the actual load for certain substations and five years of Pepco's 90/10 forecasts. The study then suggests that because the forecasted capacity is higher than the actual loads experienced, that the load forecasts must be incorrect or the methodology faulty. The comparison inappropriately suggests that the purpose of the load forecast was to predict what actual load would be in those years and that the forecast failed to predict the actual loads. However, Pepco's load forecasting and planning process does not predict the actual load that will actually be experienced in future years under normal circumstances. Instead, Pepco forecasts to ensure that the distribution system is capable of providing reliable service to District of Columbia customers during the most extreme summer weather likely to be experienced over a ten-year period. The 90/10 data will always be greater than the actuals unless the actuals being compared are for the 90/10 year that serves as the basis for the forecast.

Then, the Synapse Study claims that "the fact that each [load] forecast [in Figure 10] has been lower than the last indicates that new loads have not been arriving as quickly as initially thought."[101] In fact, when looking at Figure 10, it is clear that the load forecasts for 2014-2016 are relatively similar and even 2013 is not significantly higher. It is only the 2017 load forecast that is noticeably lower. As Pepco has reported, 2017 was the first load forecast that fully incorporated DER impact into the load forecast, resulting in cumulative load reductions of approximately 14% of the total load on the Northeast Sub. 212 Southwest LVAC Network Feeder Group. The Synapse Study's assertion is incorrect.

Finally, the Synapse Study relies on Greenlink's data—the same data that the Synapse Study admits "did not target the specific circuits" and which Pepco demonstrated above identifies the wrong customer base for the Northeast Sub. 212 Southwest LVAC Network Group—as a basis for comparison with Pepco's forecasted load. The Synapse Study adds to the Greenlink data two buildings (GAO and Capitol Crossing) which, as discussed above, are not on the Northeast Sub. 212 Southwest LVAC Network Group (either in whole or in part). Because it does not have the energy-to-square foot relationship for GAO, the Synapse Study assumes the same relationship as the Metro headquarters at 600 5th St., NW. It uses the Greenlink load that is modeled on "typical" weather (which it does not define) and compares it to Pepco's load forecast under 90/10 conditions. Finally, the study concludes that the Synapse Study has "no reasonable theories to explain the rest of the more than 20 MVA of growth that Pepco projects in the area by

101 Synapse Study at 16.

2024," implying that Pepco's load forecasted are flawed and overstated.[102] In reality, the Synapse Study has misidentified customer base, compared dissimilar load, and created Frankenstein-like load assumptions that conveniently support to the study's preferred implication that the load forecasts are overstated on the Northeast Sub. 212 Southwest LVAC Network Group.

E. MEDSIS Funding Should Not Be Significantly Depleted by a Single Project that Is not Well Founded

The possible scope of projects that can be piloted through MEDSIS is wide ranging. The Commission anticipated that the MEDSIS funding would accommodate this wide range of technologies:

> Generally, the scope of this proceeding is to identify technologies and policies that can modernize our energy delivery system for increased sustainability and make the system more reliable, efficient, cost effective and interactive . . . an examination of new technologies that will impact the delivery of energy in the District including but not limited to energy storage, distributed energy resources, electric vehicles, microgrids and the integration of identified enabling technologies.[103]

As demonstrated above, the proposed projects that DOEE and the Synapse Study have put forward are only conceptual and have not been thoroughly thought through and substantiated with reliable data. Spending $10 million on proposals that are not well formulated risks wasting half of the MEDSIS funds on projects that will produce no actual learning. More significantly, funding this project would place the electric distribution service of thousands of District of Columbia customers at risk. Finally, DOEE is requesting that almost half of the MEDSIS funding be applied/directed to one project consisting only of energy efficiency and demand

---

[102] Synapse Study at 17.
[103] Order No. 17912 at P 5.

response solutions that DOEE claims will defer a substation for one and two years. None of the technologies identified in Order No. 17912 for examination as part of MEDSIS will be included in DOEE's project. Applying $10 million of the $21.55 million to the projects in the Synapse Study would leave only $11.55 million to pilot all of these new technologies. In addition, a portion of that $11.55 million will be used to pay the consultants in charge of the working group and the RFP processes. In the end, only a fraction of the MEDSIS funding will be used on the types of projects the Commission intended.

The more reasonable approach would be to use the MEDSIS funds for a variety of smaller pilot projects that use a variety of technologies. The learning from these pilot projects will be instrumental integrating the technologies into the modernized grid in the normal course of business. It also aligns with Pepco's approach to integrating new technology into its distribution system.

F. A Working Group Targeting Mt. Vernon Would Cause Reliability Concerns

Order No. 19274 directed Pepco to file a Notice of Construction that includes both the reliability projects that are part of the Capital Grid Project (Harvard and Champlain Substations) and the load project (Mt. Vernon Substation), which Pepco has filed contemporaneously with these Reply Comments. If the Commission were to act on the DOEE Comments' requests to defer the construction of the Mt. Vernon Substation for two years and to convene a working group to look at alternative solutions, the Commission would be deferring the reliability projects (Harvard and Champlain Substations) as well. The Harvard and Champlain Substations cannot be deferred for almost three years (two years of working group time and additional time to rule on the combined Notice of Construction) without reliability impacts to customers. Pepco originally structured the two Notices of Construction to allow it to move forward with the reliability projects (the Harvard and Champlain Substations) and allow assessment of DER impact on the load project (the Mt. Vernon Substation). Order No. 19274 directed Pepco to file one Notice of Construction containing the Harvard, Champlain, and Mt. Vernon Substations and associated transmission. Moreover, as demonstrated in the Notice of Construction being filed concurrently, the Mt. Vernon Substation is necessary in 2023. The RFP for MEDSIS has properly focused the working group on reviewing non-wires solutions more broadly and not as a replacement for any particular project. The Notice of Construction approval process should move forward in parallel with the working group focused on non-wires alternatives.

III. CONCLUSION

Pepco appreciates the opportunity to complete the record with its Reply Comments. For the reasons described above, the DOEE Comments and the Synapse Study should be rejected.

Respectfully submitted,
Potomac Electric Power Company

Andrea H. Harper

Andrea H. Harper

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 6

QUESTION NO. 24
Reference Pepco (H)-2, project 268, 294 (ITN 61976, 84541).
a) Please provide a description of the software and hardware investments included in the ADMS projects and the differences between project 268 and 294.
b) To the extent possible, provide the share of total costs for each of these software and hardware investments described in a).
c) Provide a list of management functions that the Company is seeking to enable/deploy with the ADMS investment.

RESPONSE:

a. For Project 268, an ADMS is installed in each operating company. Although functionality is equivalent, configuration is specific to each OpCo. This implementation will replace their existing SCADA and OMS software as well as hardware: servers, workstations, data acquisition equipment and network infrastructure.

   In Project 294, an evaluation will be performed to determine whether it would be beneficial to combine any of the instances created in Project 268 while assessing operational risk. The aim is to drive standardization of applications, configuration and use by the OpCos. In addition, there will be a hardware refresh and redesign taking into account platform size and performance where consolidation is adopted. New functionality to be introduced includes model based FLISR (Fault Location, Isolation and Service Restoration), Fault Location Analysis, and DER Output control and DER Visualization.

b. Please see FC1176 AOBA DR 7-25 Confidential Attachment NN.

c. The ADMS system includes the applications that enable Distribution Operators to monitor, manage and control the electrical grid. This enables operators to execute system switching to isolate equipment that needs to be taken out of service for repair, and to reconfigure the electrical system due to system conditions. It enables operators to understand system configuration and restore customers in the event of electrical outages.

SPONSOR: Jaclyn Cantler

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 6

QUESTION NO. 10
Reference Direct Testimony of Cantler at p.7 "grid operations." Please describe the Company's activities related to voltage optimization as a part of grid operations:
a) What role does the Company believe voltage optimization plays in DER integration?
b) Please describe any existing and proposed investments in voltage optimization the Company intends to pursue.

RESPONSE:

a. Under certain conditions, DER can cause voltage along the feeder to rise outside of the upper band limit of acceptable voltage. A Voltage Optimization tactic is one element of a coordinated strategy that will increase the Company's ability to accept higher levels of DER on the Company's distribution system.

b. As part of the Company's ADMS platform (ADMS stage 2 / 3), the Company intends to develop a Voltage Optimization program. One element of that plan would be to include field voltage regulators and capacitors into the communications network and link these devices into the SCADA. That will allow a Voltage Optimization algorithm to fully control voltage throughout the distribution system.

SPONSOR: Jaclyn Cantler

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 6

QUESTION NO. 20

Reference Direct Testimony of Cantler at p.22 “The goal of the ADMS Project is to deploy foundational Distributed Energy Resource Management System (DERMS) capabilities - including DER Visualization, DER Estimation, DER Forecasting, and DER Monitoring & Control.”

a) Please describe all the functionalities and benefits that will be enabled by the ADMS deployment.

b) Please provide an implementation timeline for when the ADMS and DERMS functionalities will be deployed and available for use.

c) Does the Company intend to procure “digital twin” functionality as part of its ADMS procurement?

d) Where on the system does the Company expect DERMS control functionality to be deployed and how is this determined?

RESPONSE:

a. Please see the Company’s Attachment NN that was provided in response to AOBA DR 7-25 for a description of ADMS functionalities and benefits the project will enable.

b. The estimated date that ADMS and DERMS functionalities will be deployed and available for use is 2029.

c. The term “digital twin” is not a term that the ADMS project, or the software vendor is using to describe ADMS capabilities. The term “digital twin” can have various meanings so further clarification would be needed to provide a more specific answer about the functionality in question. However, ADMS does plan to include “Study Mode” models and analysis, as well as unbalanced load flow analysis both of which could be considered “Digital Twin” functionality. ADMS does not plan to include 3D geo-spatial modeling of assets if that is what is implied with “Digital Twin” functionality.

d. Given DERMS is scheduled for a future phase of ADMS implementation, the detailed functionality and capabilities have yet to be fully scoped or defined. As such, an evaluation of where DERMS functionality would reside in the organization has yet to be determined.

SPONSOR: Jaclyn Cantler

POTOMAC ELECTRIC POWER COMPANY
DISTRICT OF COLUMBIA FORMAL CASE NO. 1176
RESPONSE TO OPC DATA REQUEST NO. 6

QUESTION NO. 21

Reference Direct Testimony of Cantler at p.44 "ADMS technology is designed to communicate and control future DER to mitigate those fluctuations and accommodate for such things as the continued integration of electric vehicle (EV) charging stations and rooftop solar."

a) Please describe the Company's approach to communicating and controlling future DER including including what sizes and types of DERs it intends to directly control.

b) Does the Company's ADMS approach consider DER control approaches that do not require direct control by the Company?

c) Does the Company intend to directly control small DER systems such as residential rooftop solar or individual EV charging stations?

RESPONSE:

a. Given DERMS is scheduled for a future phase of ADMS implementation, the detailed functionalities and capabilities, including the size and type of DERs, have yet to be fully scoped or defined.

b. The detailed design of ADMS stage 2 has not been performed. However, the intention is not to limit DER controls to only direct company owned controllers.

c. Please refer to response OPC DR 6-21(a). The Company's goal is to allow for greater DER adoption, while maintaining the reliability of the grid, and safety of public and company personnel. It is currently unclear as to what capabilities & measures would be required with small DERs, as their adoption increases into the future to ensure reliability and system performance.

SPONSOR: Jaclyn Cantler
